Hope Farm Notes

FROST.—We had one with white whiskers on January 6. Our thermometer registered five below zero, and the mercury hovered around the danger point for several days. This was mild compared with what others report. The boy at college in northern New Hampshire says the mercury gave a gasp and went to 32 below. Years ago I worked in a lumber camp in northern Michigan, and one morning the thermometer certainly registered 40. The boy wrote me that I would have been surprised to see how fast he could move in the frosty air. Where one is well fed and well clad this nipping cold is good. It is a bracer which only those who live in it can realize. That's all very well for human beings well protected in wool, but what about our fruit buds? They were quite open and tender when this icy hand reached out to touch them. The mild Fall had acted like a gay deceiver to fool them into thinking Spring was on her way. I cannot tell yet what damage was done. I think the peach buds are badly hurt; however, during the past 10 years my records show that we have thought that seven different years and yet we have always had at least a light crop. It is hard to see how our buds could stand this freeze, but we are good waiters and before we say "Good night" we shall wait for the bloom.

THE SCRUB HENS.—We are no longer at the tail end of that egg-laying contest. During the week ending January 9, one of our birds woke up and laid three eggs! We are no longer in the "also ran" class. The Silver Campines, the Cornish and one pen of Reds are still at the zero mark. Here we are tied for seventy-sixth place with a pen from the Connecticut College. Are we going to come sailing up near the head? Watch us! There is certainly room at the top. On January 15 my report was that one bird was laying, three showed "some development," and six "no evidence." During that week there were 851 eggs from 820 birds. These eggs were laid by 236 birds, for it is a fact that 584 birds never laid an egg. Nine of my scrubs were guilty, and I cheerfully admit it, but what about the other 575 blue bloods that went dry? For example, the Heneta Bone Co. have entered a pen—personally fed under their direction. These birds (Leghorns at that) never laid an egg during that week, and have laid only 13 in all. Out of the 236 birds which laid, 123 laid more than the Hope Farm scrubs, while 112 laid three or less. I am not prepared to match 'Hope Farm Lady" against one of Tom Barron's Wyandottes, but she may yet be the great-grandmother of a pen of winners. At any rate, win or lose, we stay by the Hope Farm scrubs.

CALLING NAMES.—One of our good friends wrote that he is very sorry to have me allude to some of our children as "redheads." This, he thinks, must be humiliating to the children, and to clinch his argument he says *"How would you like to be called old Redhead?"* The name would not fit me, for my head is as devoid of red hair as my scrub hens are of eggs. I care very little what people call me. If the name is appropriate I could not dodge it anyway, and if it does not fit it will soon drop off. Instead of feeling "humiliated," our three little people feel rather proud of their flaming tops. They know that this is an endearing title which fits them well. The color of their hair skipped two generations, but came originally from a very good man. As I write little Redhead sits by the fire reading a book about wild animals which keep warm and comfortable in the snow. I think the little fellow is rather proud of his title. They all know what we mean, and they take no offense. Out tumbling in the snow or sliding on the ice the red in their faces matches their hair, and while I cannot prove it scientifically, I think this red pigment is an indication of vigor and health.

WOMEN'S WORK.—This cold weather makes life a trouble to many farm women. Some of them are naturally delicate and cold and others have been overworked with trying to perform all their duties without conveniences. Our folks know what this means, for there were several years when all water was pumped from a well and brought to the kitchen stove. Then we piped it to the kitchen and finally arranged for a regular water system. Then there are cold and windy houses, inconvenient kitchens, and what is often worse, a lack of appreciation of what the mother tries to do. For "mother" is expected to be the hub of the household wheel, no matter how tired or sick she may be. It comes hard for her in such weather as we are now having. Great things for the benefit of the farm are being suggested. Many of them will be carried out and put in force. What about the farmer's women folks? Many years ago in a pioneer town out West there was a debate in the school house—on this remarkable subject:

"Resolved, that for a man on a backwoods farm a cow is of greater value than a woman."

The debate ran along about even until the affirmative speaker made this remarkable argument. He claimed that "value" meant money and nothing else, and that if the crops failed and the man could not pay interest he could sell the cow, while the woman would be an additional expense. This won the debate for the cow! The judge made his decision almost as follows:

"My sympathy is with the wimmin, but the money goes on the cow, for as we all know sympathy don't pay any mortgages or buy groceries."

A woman with her face shining with righteous indignation jumped up in the audience and told how she had with her own hands supported a lazy husband and fed a cow and five children, but the judge decided that her argument did not count, as she was not one of the selected debaters! Now I have had farmers tell me that the farm papers do not give them anything to think about. I suggest that there is some food for thought in that old debate, and the way the judge shut off the most effective speaker!

"EXCHANGE."—Some time ago a man in Florida thought he would like to exchange grape fruit or oranges for apples. As this was a new proposition his note was printed as an experiment. The letters began to pour in at once. This man wanted one or two barrels of apples, but at least 30 people wrote him wanting to exchange. Now I get this note from the Florida man:

That THE R. N.-Y. is effectives goes without saying. In this present case I am reminded of the Christian Science absent treatment for a man with one leg shorter than the other. The treatment worked fine for a while. Soon, however, the suffering patient appeared at the office of the doctor, who was out of town, with the request that the doctor be wired to "stop that treatment immediately; that the short leg was now longer than the other one."

There is no question about the fact that our readers are interested in an "exchange." Every person has wants and wastes. By the latter I mean things which he cannot use at home, yet which bring but little when sent to the wholesale market. There is always some one to buy these things at a direct trade if they can only learn how to get them.

RIGHTS IN A CHILD.—Here is a question which gets down to the root of trouble in many families:

Last Summer I took a little child to raise. The mother is dead, but the father came to see me and told me I could have her, but there are no witnesses to prove this except the child. Have I any hold on her, or can he take her any time he wants to? She is devoted to both my husband and myself, and the father never notices her or gives her a piece of clothing; will not even visit her. G. H.
Maryland.

This is one of the things we know something about. The safe thing for you is to take out guardianship papers or get the father to sign a paper to the effect that he gives up his right in the child. As a rule such men are very willing to have some one else provide for their little children. When such children grow large enough so that they can work and earn something such fellows usually show up with a demand for their "dear little ones." They want to put these "dear little ones" at work and pocket the income. You can of course present a bill for the care of the child, but the father will not pay it, and this would only make a bad feeling in which the child would join. H. W. C.

E. Frank Coe Fertilizers

1857 THE BUSINESS FARMERS' STANDARD FOR OVER FIFTY-FIVE YEARS 1913

Do You Raise 300 Bushels of Potatoes per Acre?

THREE hundred bushels per acre is not an unusual yield by any means, but did you get it this year?

¶If you were planning to raise 300 bushels of potatoes to the acre how far apart would you space your rows? How far apart would you drop the seed pieces in the row?

¶How much fertilizer would you use to grow 300 bushels of potatoes per acre? How would you apply it?

¶Are you sure that your seed potatoes are true to name and true to type?

¶What are you doing to prevent "scab" and early and late blight?

¶Did you have a short crop of potatoes because of dry weather? Have you decided how you will overcome this trouble in the future?

¶All these practical points, and many more, are fully covered in our new book

"Potatoes: A Money Crop"

which will be sent free to every potato grower who requests a copy, and mentions this paper.

¶This book is written by a man who himself has had years of experience as a potato grower, and who has made a careful study of the best methods of other growers.

¶If you read this book you will keep it for future reference. It is a "worth while" publication.

AMERICAN MEDICINAL FLOWERS, FRUITS AND SEEDS.

The above is the title of Bulletin No. 26, of the U. S. Department of Agriculture, contributed by the Bureau of Plant Industry. It is prepared by Miss Alice Henkel, whose previous bulletins on medicinal leaves, herbs and barks possess much interest and value.

In collecting medicinal material, the bulletin states that flowers bring the best price when, after drying, they retain as nearly as possible their natural color and odor. They should be gathered when they first open, and no faded flowers included. They should be carefully dried in the shade, and not allowed to become moist. Fruit or berries should be gathered when mature, and dried carefully, so that they do not stick together or become moldy. Seeds should be collected as they are ripening, just before the pods open; placed in trays, and dried carefully in the open air. They should be shaken frequently to insure even drying, bits of stem, leaf or shriveled seeds being removed.

Shipments should be carefully packed in sound burlap bags or clean boxes. It is advised that samples be sent before shipping, with full information as to the quantity the prospective seller has to dispose of.

Berries of the common juniper, Juniperus communis, sell for two to 2½ cents a pound; they are collected when ripe, usually about October. They are used for distillation of oil, for flavoring gin, and medicinally as a stimulant and diuretic.

The berries of the saw palmetto, Sabal serrulatum, are used officially in medicine, and sell for 25 to 27 cents a pound. The fruit ripens from October to December, but collection begins before it is fully ripe, in August, and extends into January.

Wormseed (Chenopodium anthelminticum) is a very common and exasperating weed, but its dry seed brings from eight to 10 cents a pound, while oil of wormseed is $2.25 to $2.50 a pound. We are told that in some parts of Maryland wormseed is cultivated to a considerable extent, for the distillation of this oil.

The berries of the familiar pokeweed (Phytolacca Americana) are gathered when fully mature, and carefully dried in the shade. They are poisonous, but of value in medicine, and sell for three to four cents a pound. Poke-root is also used medicinally.

Black mustard, Brassica nigra, and White mustard, Sinapis alba, are both troublesome weeds, and are both used in medicine. The fruiting tops are gathered before fully ripe, and placed on a clean shelf or floor to dry out and open the pods, when the seed is easily shaken out. It is quoted at two to four cents a pound.

Prickly ash (Zanthoxylum clava-herculis and Z. Americanum) furnish berries which, when dried, command 10 cents a pound. They are pungent and aromatic, and as found in commerce consist of the brownish seed capsule, sometimes still containing the black seed, but usually it has shattered out.

The handsome red berries of the smooth or upland sumac (Rhus glabra) should be gathered and dried while bearing the velvety covering, which gives them their acid taste. They bring about five cents a pound.

Linden or basswood flowers are collected in May or June and carefully dried in the shade. A tea made from the flowers is used for headache, indigestion or colds. In some European countries linden tea is regarded as very soothing to the nerves. The dried flowers are quoted at 35 cents a pound.

Seeds of the dangerous and deadly poison hemlock (Conium maculatum) are, while green but fully grown, carefully dried in a dark but well-ventilated place, and then stored in tight cans or boxes so that light and air are excluded. This seed brings eight to nine cents a pound. It has medicinal value, but the gatherer should always remember that it is a deadly poison.

Jimson weed (Datura stramonium) is another poisonous plant whose fruit and leaves are used in medicine. The seed capsules are cut when mature but still green and dried until they open. The seed is then shaken out, and spread to dry thoroughly. The seed is worth six to seven cents a pound.

Mullein flowers are collected when fully open, but not ready to drop, and carefully dried. They are listed at from 70 to 80 cents a pound. Elder flowers are dried quickly when fully opened, so that they are yellowish in color, not brownish or black; they are used as a home-remedy, and also officially, selling for 18 to 20 cents a pound. E. T. R.

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.01, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

DURING the past season we have had a dozen letters from farmers who have been led to believe that manure from cows which are fed on silage is too sour to use on ordinary land. As it is known that silage is sour these farmers argue that the manure must be. Some of this theory is due to agents of lime companies who are trying to sell lime. It is theory to think that manure ought to be sour because we know silage is. It is fact to examine the manure and find out. Such facts show there is no ground for the belief. The organic acids in silage are absorbed in the body of the animal. Such manure is not sour. At the same time the soil where this manure goes may need lime.

*

DID you ever teach a district school with very positive ideas about some proposition which you considered impossible or not practical? You advance these ideas with considerable force until some farmer came forward with the thing actually in operation. If you have been in this position you know how that article on skunk farming (page 158) hits us. We have seen many a skunk farm go back to failure. Yet here comes the great Conservation Commission of New York with five licensed skunk farms and a fragrant bill of health for the business. So they have "good skunks" de-scented with a pair of shears! A "good skunk" seems somewhat like a "good trust," denatured by force! However, we give the news and the facts—those gentlemen who wish to breed skunks may do so. Not any for us!

*

WISCONSIN seems to be carrying the idea of co-operative buying and selling nearer home than most other States. Now the scheme is to handle eggs through the cheese factory. The University Bulletin tells us:

> In one community near Milwaukee a group of farmers deliver their eggs at the same time that they deliver milk to the cheese factory. The eggs are then graded and packed, the operator being paid one cent per dozen for his service. The eggs are shipped twice a week from a nearby crossing on the interurban line and consigned to a Milwaukee grocer.

The grocer sells the eggs direct to his customers. Under this plan the farmers receive more for their eggs and have a steady market. Now this cheese factory was giving farmers a chance to bring their milk together and thus secure the benefits of manufacturing. Why not the same with another farm product—eggs? The cheese factory will make good headquarters for the sale of a dozen farm products.

*

YOU will admit that we have talked cover crops in school and out. When we had no better crop to sow we put in rye. We have kept up this talk because we know what these cover crops and lime are doing to our own soil. Some of the experts regard rye as a sort of despised crop by the side of clover and vetch. Give our old friend rye a chance and it will prove itself. Now we notice that the cover crop idea is spreading. A news note from the Ohio College states:

> In a locality where onions and celery are grown extensively, some of the truckers, late in December, were plowing their ground for next year's crop. They were turning under a good stand of rye that had been sown after the harvesting of the onion crop. This rye was of about three months standing and made a heavy growth which covered the ground with a thick mat of green vegetation. The roots had gone down deeper than the plow was running, and the entire furrow that was turned up was filled everywhere with a thick fibrous mass of roots. Two of the best results that follow such a treatment of soil are these: The decayed rye plant will go far toward keeping up the humus content of the soil and the great number of roots that everywhere permeate the soil will, after their decay, have left that ground porous and easy to work.

In this case, as we see, the rye followed onions and held the soil until Winter plowing. This rye during the 100 days of its growth had saved nitrates which would otherwise have been lost by drainage and filled the soil with its roots. It had not interfered with the usual culture, but had paid back three times the cost of seed and labor.

*

WE find much interest taken in those Oregon hens which laid 303 and 291 eggs inside of a year. In order to be sure about their breeding we wrote Prof. James Dryden, who had charge of their development. He says:

> The hen in question was bred from an original cross of Barred Plymouth Rock and White Leghorn. There was no White Plymouth Rock blood used. In the first cross the chickens were practically all white, and in breeding them back to Leghorns there is no trace of black or barring in them now. The hen which laid 303 eggs is not inbred or linebred, but the one which laid 291 eggs is the product of breeding a son to the mother. Though we got this one phenomenal layer the average results of our inbreeding are not good. J. DRYDEN.

It would be a mistake to encourage such close inbreeding. There might be a few great individual performers as the result of it, but the final result would be loss of vitality and disappointment.

*

> MASSACHUSETTS and New Jersey have nothing over New York State in misguided justice. Here is the New York case. The owner of a farm was annoyed by a prowler living in the vicinity who took advantage of every occasion when the owner and his wife were away and tried to get into the stable or the house. On the last occasion the owner came home and ordered this nuisance off the premises. He refused to go, and displayed a weapon, whereupon the owner relieved him of his weapon and then marched him off the premises by the coat collar. This man then procured a warrant for the arrest of the owner on a charge of assault and battery and obtained some village loafers, relatives of his, to perjure themselves in court, with the result that the owner was fined $10 by the justice *for putting a man off his own premises.* N. D. R.

We have no full record of this case, but in the facts here given the victim ought, as a public duty, to refuse to pay this fine and carry the case higher up. We have no doubt such things can be duplicated in every State where rascals take advantage of local courts and conditions. Personally, in such a case we should refuse to submit to such fool law, and thus compel the local "justice" to carry it up where the public could understand it.

*

IT is a pleasure for us to give Prof. Hedrick's admirable report on the "Hitchings" method of caring for an apple orchard. During the past 10 years there have been some hot arguments over this matter. When we get down past the fog and the prejudice we find that it is a matter of the man thinking out the plan best adapted to his own soil and location. We wrote Mr. Hitchings, asking him to discuss Prof. Hedrick's report if he cared to do so. We have received this letter:

> I did not hear Prof. Hedrick at Rochester. Raymond, my oldest boy, was there, and says he was fair in his report, admitting that at our place the mulch method was all right, and was a success in every way. That is just what we have claimed for the method. I also believe that at many points in the State the same success could be duplicated. After reading the report I may make a few comments, especially on condition of soil after 10 years of cultivation. The 25,000 trees under my care, all under mulch method, are the answer I give to those who want to know what I think of cultivation. GRANT G. HITCHINGS.

One of the best points Prof. Hedrick makes is that "*a man may break away from common practice * * * and yet attain a high degree of success.*" Hitchings is a pioneer who thought out his plan and then went at it regardless of laughter or abuse. We rejoice in his success for that reason.

*

THE Supreme Court of Washington has decided an important nursery tree case which will interest all who buy misfit trees. A nurseryman (A) sold 500 or more peach trees to a dealer (B), who in turn, sold them to a farmer (C). The trees proved to be misfits and C brought suit against B, winning a judgment. Then B sued A for the amount of this judgment with all costs and lawyer's fees added—all amounting to $2,306.45. On trial the lower court threw the case out on the plea that it was not brought within three years of the time of sale. The case was carried to the Supreme Court, which orders the case back for trial.

It is stated that the real intent of a guaranty in the case of fruit trees, though it may not be so stated, is that the tree will produce a certain variety of fruit, and this cannot be determined until the tree comes in bearing.

This is common sense and good law, for how can a buyer know that his trees are misfits until they actually bear fruit? He would be laughed out of court if he tried to prove his case from the leaves and type of a young tree. Some men wait too long after the trees bear fruit and prove to be "rogues." The safe rule is to get busy at once when the fruit gives the evidence. Send fair samples taken before competent witnesses to the Department of Agriculture at Washington, and be sure that you can prove beyond question that the trees which bear this misfit fruit are the identical ones you ordered and received. Unless you can do this you will have trouble to prove your claim.

*

THE secretary, E. C. Gillett, and the executive committee of the New York State Fruit Growers' Association were voted thanks in a formal resolution, but I doubt if they really ever knew of the real appreciation so often expressed and felt out in the audience among the members of the good work they had done, and of the general feeling of uplift.

This is taken from a private letter written by a farmer who attended the recent meeting at Rochester. There can be no doubt about the high regard which fruit growers have for Secretary Gillett and the other officers of the Association. These men have worked overtime to make the society a power. It has been a clean, honorable record, without graft or favoritism. We want these men to realize that fruit growers appreciate their work.

*

THERE has never been anything quite like the extensive use of muck as a fertilizer which will be started this Winter. On thousands of farms the muck is now being hauled out and mixed with lime or wood ashes. It will sweeten and ferment during the Winter, and in Spring give a fair supply of available nitrogen. Do not expect too much from this muck. You will be disappointed if you do. Hauling it out will provide a profitable job for a Winter day, but there is no great bonanza in it. The dried muck is good for absorbing the stable liquids or for mixing through the manure. When sweetened with lime it makes a good foundation for applying chemicals. By mixing bone or acid phosphate and potash with the muck you make a good substitute for manure. Here are the things to remember about muck. It is sour and must be sweetened with lime. It contains some nitrogen, a little phosphoric acid and less potash. It is not uniform; some samples have three times as much nitrogen as others.

*

THE Maryland newspapers report a legal case which should interest fruit growers. The facts as stated show that Walter E. Mueller worked under contract in a "unit orchard" controlled by J. H. Mertens. In 1910 Mueller began planting apple trees. He suggested that the pruning clippings be saved for use as scions. Mertens told Mueller to take the clippings, as he (Mertens) did not care for them. So Mueller packed a few bundles of these clippings and stored them in a basement. He later started an orchard company of his own and secured option on land, as these companies usually do. Trouble seems to have started and Mertens tried to secure these options. Finally he seems to have located the box of clippings which Mueller had stored. These boxes were seized and Mueller was arrested and jailed for theft. On trial he was acquitted, and then brought suit for malicious persecution. This case was decided for Mueller, but later the upper court reversed this verdict and ordered another trial. This second trial resulted in a verdict of $5,750 for Mueller, and this has been affirmed by the Court of Appeals. It looks as if this case represented a battle between "unit" or company orchards. We do not hear so much about these enterprises now, probably because there is little to say, and not much more money to be dug out of the public.

BREVITIES.

THERE is a genuine demand for a machine that will grate or scrape up beets or mangels for poultry food.

HERE is a sincere compliment to this genial season. In Quebec Province on November 27 farmers were still plowing and laying tile.

IN speaking of fine stock remember that *thoroughbred* refers to a race or breed of horses. Other animals are *purebred* if they are eligible to registry.

A NEW Wisconsin idea is a country cattle exchange where good cows and bulls may be listed for sale or exchange. Many good bulls are sacrificed because the men who really need them do not know the animals are for sale.

A GOOD open fire is one of the best fixtures for a farmhouse. It gives comfort and good cheer, and is also one of the best ways of ensuring plenty of fresh air. The draft up the chimney sucks away the foul air, and does it so there is no danger from colds.

AN actress recently crossed the ocean to this country carrying a Leghorn hen. Her object was to obtain a fresh egg every day. But the hen refused to lay! Someone says she did not have her sea legs on. A Plymouth Rock should have made a better working immigrant.

WHO can rightly find fault with Mr. Phelps for what he says on page 139. Some men are naturally fitted for work in managing a large farm. As a rule they are farmers by nature, and were trained by a good farmer. Most of our advice about small places is given to back-to-the-landers who never had much experience.

A READER whose farm is off the main road makes complaint about the rural mail delivery. This man has a box on the regular route, but must travel over a mile back and forth each day to obtain his mail. He wants to know how many country people are served by the rural delivery, how many of them are in his situation, and why the mail wagon cannot come to his door. We have received the following letter from Washington:

I beg to state that the latest estimates indicate that 5,040,129 families are receiving rural delivery service, or a total population of 23,184,593. There are no data available to show what proportion of these patrons reside at remote distances from the lines of the routes.

With reference to your statement that complaints are made by patrons who are obliged to travel half a mile or more in order to reach their boxes, it should be stated that the Department endeavors to operate rural delivery service upon public roads which are the more thickly settled. It is not practical to serve all patrons at their residences and many persons who do not reside on the roads traveled by the carrier receive service by erecting boxes along the lines of the routes.

W. J. SATTERFIELD,
Acting Fourth Assistant Postmaster General.

We see little hope in that for an extension of the route. The proper plan is to apply to the postmaster. If he refuses apply to Washington. If you can "apply" hard enough an investigation will be made, but usually the postmaster decides it.

*

I STARTED to take your paper last Fall, and while looking through it I notice you answer a lot of very important questions, which are a great benefit to the farmers, as well as many other people. Do you answer these questions free of charge? If so, what is the difference between burnt lime and ground rock lime? If any difference, what is it, and which one is the better?
New Jersey. S. J.

The questions from subscribers are answered freely. We appreciate plain and sincere questions, because they show better than anything else what our readers are thinking about, and what their problems are. Up to January 22 we had written 2,001 letters besides the hundreds which are answered in print. It is not always possible to answer all such questions off hand, as many of them require the opinion of an expert, and must be sent away for replies. In one case a reader sent 15 questions at one time, written in a small and not very clear hand on both sides of the paper. They ran all the way from a legal matter to the care of a sick cat. We were obliged to copy these questions and send eight of them away to different authorities. The instructions here are to answer such questions patiently and with good nature, no matter how often they have been covered in print. For example, take this lime matter. We must have stated 300 times that lime rock as it comes from the soil is called raw lime. When it is crushed or ground finely it is called ground limestone or carbonate of lime. When burned with wood or coal in a kiln the limestone loses its carbonic acid and is known as caustic, quick, lump or stone lime. When this burned lime is left exposed to air or water it "slakes" or takes up moisture, and is then known as slaked lime. This slaked lime is better for use on very sour or tough, hard soils, or where you want a quick action. The ground limestone is suitable for the lighter soils, or for soils well filled with organic matter. The rule is to use twice as much of the ground limestone as of the slaked lime for equal results.

*

IN spite of all we have stated about this potato quarantine, there seems to be some question about imports. We understand that potato buyers in some localities are still telling farmers that the markets are flooded with foreign potatoes, and that the price should be cut in two. This is absolute nonsense or worse, and farmers should not be frightened or bluffed by such talk into giving away their potato crop. The Secretary of Agriculture has ordered that the quarantine against foreign potatoes be extended so as to cover Great Britain, Germany, all the rest of continental Europe and Canada. This order was made effective on December 24. Shipments then started will be admitted up to January 15, after which no potatoes can be brought from these foreign countries until the quarantine is raised. No more potatoes can be brought into this country from abroad until the growers and shippers can satisfy the Department of Agriculture that their stock is free from disease. Such potatoes in order to be admitted must be certified by the government of the country where they were grown, to be free from dangerous disease and insect pest which are new to this country. It must also be proved that such potatoes were grown in a district free from the wart disease and powdery scab. It seems that Canada has absolutely prohibited imports of potatoes from Europe. This includes Great Britain and Ireland, and also the neighborhood island of Newfoundland. These diseases are widespread abroad, and it does not seem likely that they can be stamped out for some years. This year's crop is large enough to supply all the potatoes needed by our own people, if it is distributed fairly and sold at reasonable prices. The demand for large imports of potatoes from foreign countries was worked up largely by the importers and buyers, who desired to use these stories of enormous imports to keep down the price of what they could buy from our farmers. Pay no attention whatever to such stories from the middlemen and buyers. Our city markets are not flooded with foreign potatoes, and they cannot be so flooded now as long as this quarantine holds. The crop should bring a fair price to the farmer. It will not be wise to speculate and hold them for an excessive price, for the moment that the price of potatoes reaches a certain point, the public will stop buying them and eat cornmeal and rice instead. The situation has now been made clear, and the American crop ought to be regulated in price very largely by supply and demand.

*

AMENDMENTS TO THE COMMISSION LAW.

The New York Commission Man's Law has demonstrated both the need of such legislation, and also the fact that certain amendments are needed to make it fully effective. The principle of the law is right, but a year ago the commission men succeeded in striking out certain provisions, which have made it difficult in some cases to obtain the full rights of shippers. During the present Legislature amendments must be passed to strengthen this law so as to give full protection to the farmer. The amount of the bond should be increased from $3,000 to $5,000. The object of this is to prevent loss in case of failure or rascality on the part of the commission house. There have been cases in the past where commission merchants did a large business, and were able to obtain full credit from their shippers. After handling a large volume of trade, and working up large debts they failed or absconded, and their customers lost practically everything. By increasing the bond to $5,000 the creditors in such cases would have at least that amount of money to divide among them, and this would help. There have been a number of complaints where shippers felt they did not receive a fair price. Upon investigation it was found that the commission man had kept no record whatever, from which the sales could be traced by him. He simply had a little memorandum stating cash so much, or a similar statement. In such cases it was impossible to carry the investigation further. This made the investigation so limited and so hampered that there was really no way of telling what these goods sold for, or whether the shipper actually received what was due him. An amendment to the law is therefore absolutely necessary. The commission man must be compelled to keep accurate records of his sales, so that an investigation will show who bought the goods, and what was paid for them. In the original bill there was a provision of this kind. The commission men were able to cut it out, and experience has shown that such a provision is absolutely necessary to make the law effective. Again, a fair amendment is necessary to guard against the practice where commission men take goods on their own account. This is one way in which the shipper is often defrauded. Goods may be received by a commission man and sold to his own account, or to some relative, or to some other house in which the commission man is indirectly interested. It is possible to make such sales at a very low figure, and make returns on this low basis, no names being given. Then the goods are sold again to the dealer or retailer at a much higher price, the commission man sharing again in this rake-off. An amendment is needed to stop this practice. All these things will be brought up in the Legislature this year, and farmers throughout the State must get together once more, as they did back of the original bill, and put these amendments over.

*

PORK PRODUCTS DIRECT TO CONSUMER.

We have about 30 pigs that we wish to kill the last of the month. The thought has occurred to us that possibly we might dispose of them in the form of sausage, ham, and bacon, either fresh or cured. These pigs have been fattened on sweet condensed milk, and cornmeal, they are in fine condition, and the meat is specially good on account of the sugar in the milk. They will weigh dressed from 100 to near 150 pounds. We have killed a few for our own use, and we would have from the 30 about 600 pounds of sausage. We can get 18 cents per pound for the sausage here in limited quantities, 20 cents for the hams, and 18 for smoked shoulder. It would be our plan to put the sausage up in five and 10 pound pails or cartons, and deliver by parcel post in the second zone for 20 cents per pound. The ham we would deliver for 22 cents per pound. We would also ship fresh hams for 20 cents delivered. We wish you would write us your opinion of this scheme. Do you think the above prices would appeal to your city readers? The prices are the same as we can get in our home market, only the demand here is quite limited. The product will be pure pigs' meat, and delivered in good condition. F. S. MACKEY.
Schoharie Co., N. Y.

We follow the plan of giving publicity to new experiments in seeking a direct trade. The success of this business will depend entirely upon the quality of the goods. If your sausage and hams are superior, and put up in neat packages, they will sell after people sample them. You cannot expect to jump into a large trade at once. Remember if you were the buyer you would naturally order a small lot at first. If the goods were satisfactory you would order more—if not you would not touch them again. In a trade of this sort you will have to "follow up" your orders and keep after your customers. Do not expect them to come after you entirely. On general principles it will be better to go after trade in the towns and cities nearer home rather than to try general advertising in the larger cities. Within 100 miles of your farm you ought to find a satisfactory market for all this meat. Work the local market to the limit first. The prices you mention would be satisfactory for high-grade goods.

*

THERE are many stories told of Horace Greeley and the wonderful hold he had upon his readers. At one time an agent in a country neighborhood found a farmer sitting on a fence too much troubled over something to go to work.

"You don't seem happy," said the agent.

"I'm not. I had an argument with my neighbor over south on the tariff, and he beat me. Raised a point I couldn't answer, and he crowed over it!"

"Can't answer him, eh?"

"You just wait till Horace Greeley's paper comes. I wrote him about it. He'll print the argument I need and then I'll go and wipe my neighbor off the earth!"

Those were the strong, golden days of personal journalism—days of stronger prejudice and passion than we now know. There were fewer books, and facts were given out by men who had keen instincts and shrewd knowledge of human nature. These farmers believed in Greeley because he seemed one of their kind, who had their interests at heart. When he said a thing in print they believed it, and were quite willing to fight for it. THE R. N.-Y. has no desire to be considered an authority on partisan politics, or appeals to prejudice. It is our ambition, however, to learn and express those truths about farming which may set farmers free. There will always be differences of opinion regarding the most simple proposition. We do not pretend to lay down the law in any dogmatic spirit, but we believe that a thorough discussion among our readers will sift any proposition down to the truth. Instead of waiting for someone else to settle the matter for him, we encourage a farmer to think it out for himself.

Potato Statistics.

The U. S. Department of Agriculture makes the following statement regarding commerce in potatoes:

The largest importation of potatoes in any single year occurred in 1912, when the total quantity imported was 13,750,000 bushels, the next largest being in 1909, 8,333,000 bushels, and in 1902, 7,666,000 bushels. The total quantity imported since 1900 is practically 37,000,000 bushels and the quantity exported in the same period, 16,000,000 bushels, the total production in the United States during that period having been over 4,000,000,000 bushels, or an average of approximately 300,000,000 bushels per annum, the figures of recent years averaging about 300,000,000 bushels per annum except in years of abnormally short crops.

The high importation of 1912 followed the short crop of 1911, when the total production was but 293,000,000 bushels, against 349,000,000 bushels in the year immediately preceding. That of 1909, 8,333,000 bushels, followed a short crop of 279,000,000 bushels in 1908, against 298,000,000 in the year immediately preceding; and that of 1902, 7,666,000 bushels, followed a crop of but 188,000,000 bushels in 1901, against 211,000,000 in 1900.

England, Scotland and Ireland are the chief sources of supply of the potatoes imported. Of the 13,750,000 bushels imported in 1912, 4,666,000 came from Scotland, 4,500,000 from Ireland, and 3,333,000 from England. The other principal countries from which potatoes were imported in 1912 were: Belgium, 336,000 bushels; France 243,000; Canada, 143,000; Bermuda, 132,000; and Netherlands, 122,000.

Potatoes exported go chiefly to Cuba, Canada, Panama, Mexico, Colombia and Venezuela. Of the 1,250,000 bushels exported in 1912, 659,000 went to Cuba; 256,000 to Canada; 114,000 to Panama, 97,000 to Mexico; 12,000 to Colombia; and 11,000 to Venezuela.

Potato production in the United States is small, compared with certain other countries having a smaller area and less population. The product of Germany in 1911 was 1,263,000,000 bushels; Austria, 426,000,000; France, 424,000,000, and the United States, in that year, 293,000,000 bushels. The production of the United Kingdom, from which our chief importations are drawn, is considerably less than that of the United States, having been 281,000,000 bushels in 1911, of which 138,000,000 were produced in Ireland, 100,000,000 in England, and 36,000,000 in Scotland.

The farm value of the potato crop of the United States in 1913 is estimated at $228,000,000, a larger total than that for any earlier year except 1911, which was $234,000,000.

Buy Delicious--Leader of All Orchard Money-Makers From Its Home and Headquarters

Stark Delicious, the crowning glory of the apple kingdom, originated on the farm of the late Jesse Hiatt, at Peru, Madison county, Iowa, in about 1870.

Mr. Hiatt was a man of sound judgment in matters pertaining to fruit, and when he saw the little tree which had found lodging in a corner of his orchard, he knew it was worth preserving.

There had never been a tree like it before. It was a sturdy specimen—well shaped. Mr. Hiatt believed that here was a discovery that would some day bless all mankind.

He nursed the tree carefully and gave it the most tender care. Finally it bore fruit—and all of Jesse Hiatt's confidence in the new variety was realized.

It bore fruit that looked different from everything else—more beautiful than any variety he had ever seen—and that *tasted* better than any other apple.

Mr. Hiatt looked about for a concern whose ability and reputation justified its propagation. He offered it to the Stark Bros. Nurseries and Orchards Company, of Louisiana, Mo., and samples of the fruit were sent to Clarence M. Stark, then president of the Company, for expert tests as to real apple quality.

After Mr. Stark's conviction as to the great posibilities of Delicious had been firmly formed—after experiments with it in various parts of the country had established it as the *greatest* of all apples and a *national* apple good for all climates, he paid a visit to the home of Jesse Hiatt, examined the original tree, purchased it with the exclusive, perpetual rights of introduction and propagation, and entered into a legal agreement with the man who had discovered and preserved it. The name "Delicious" was registered by Stark Bros. in the United States Patent Office as a trade-mark, and soon the great work of sending this matchless variety to all the civilized world was on in real earnest.

Since then 15 million Delicious trees have been propagated and shipped from the *home* and *headquarters* of Delicious at Louisiana, Mo.

Are *you* familiar with Delicions quality? Have you had the pleasant *profit* experiences of all who plant Stark Delicions trees?

If not, *this is your year to start.* Our Delicious stock is particularly good this year, and you can't go wrong in *ordering early.* We recommend that you get your order in without delay.

Read What Growers Say About Stark Delicious Profits

Mrs. E. A. Johnson, Hamilton, Mont., says: "On eight to ten-year-old apple trees I figure $500.00 to $600.00 per acre net profit. From our experience I think this conservative. We have received as high as $10.00 per box for Stark Delicious, while $5.00 is readily obtained."

J. S. Huey, Chicago, Ill.: "I asked in one of the high-grade fruit houses of Chicago if they handled Stark Delicious. They said they did, and that they paid $9.00 per bushel box for them, and would be glad to pay $12.00 per bushel box for them at that time."

F. S. Burgess, Chelan Co., Wash., realized net profit of $882.93 from thirty-six ten-year-old Stark Delicious apple trees. These trees occupy only one-third of an acre of ground. The preceding year the returns from the same trees amounted to $1,500.00, the crop of that year being considerably heavier.

"Last season I sold my orchard very satisfactorily, or to express it more truthfully, the Stark Delicious sold the orchard. I have some sixty varieties of apples, but if I were to do it over would plant at least half to Stark Delicious."—Adam Thompson, Buchanan County, Missouri.

"Stark Delicious brought $7.50 per per barrel. I have ten trees of this variety, bought seven years ago, which bore heavily this year. In fact, they produce more fruit than any twenty trees of other varieties planted at the same time."—J. S. Coleman, North Carolina.

"Stark Delicious have withstood 50 degrees below zero without injury. The same is true of Stark King David."—R. J. Wiggins, Province of Quebec.

STARK TREES AT LOUISIANA, MO. SINCE 1816

The Story of a Grand Old Tree

Below is a recent picture of the original Delicious tree (photographed Dec. 28, 1913), which Jesse Hiatt gave to the world when he sold exclusive right of propagation to Stark Bros. Nurseries and Orchards Co., of Louisiana, Mo.

The gentleman with the moustache is S. L. Hiatt, son of Jesse Hiatt, discoverer of the tree and the man who made the contract (still in force) with Stark Bros. The other man in the picture is the Official Photographer of the Stark Bros. Company.

This illustration shows the grand old tree in its present rotting condition—worn out, overgrown with watersprouts and worthless for propagating purposes.

But the splendid monarch of the orchard has done a great work. No other apple tree has such historical interest as this veteran—the wonderful gift of nature.

When Stark Bros. secured from Mr. Hiatt in 1894 the perpetual right of propagation from the original tree, and when Clarence M. Stark (then president of Stark Bros.) went to Iowa to inspect the first Delicious that ever grew, this tree was in its prime. Its strong, vigorous, upright limbs bore an enormous crop without breaking. Stark Bros. sent out many trees directly from cuttings from this old original Delicious tree up until late years.

The ravages of time, the bleak winters of nearly half a century, the various enemies of tree life were withstood for a long time, but in later years this grand old tree has rapidly given away. In face of these overwhelming odds, the old tree still battles despite the heavy *inroads* of *decay* which have eaten to its very heart, causing it to become overgrown with watersprouts and greatly weakened.

But the original Delicious tree has accomplished its purpose. From it have been taken, in the prime of life, scions which have been propagated by Stark Bros. and grown to thrifty, vigorous young trees. Stark Bros. have sold to the progressive orchardists in every section of the country these Delicious trees, and to-day these splendid orchards are bearing crops, bringing the growers profits hitherto thought impossible. In fact, these Delicious orchards have rivaled and even surpassed the wonderful record of the original tree.

So we—the *developers* and *introducers* of Delicious—thus pay tribute to this now useless servant of mankind, and to Jesse Hiatt, its noble discoverer, of whom S. J. Hiatt wrote when the veteran died in 1898 at the age of 70 years: "Although not well, he obtained great peace of mind and his countenance shone like one who confers a great blessing on the children of men when, through the energetic and reliable Stark Bros., he gave his apple to the world."

Original Delicious Tree in 1913—Stark Bros. representative at left, S. L. Hiatt at right

Stark Bros.--Introducers of This Greatest Apple, Offer You Its Profit Possibilities

GENUINE STARK TREES BEAR FRUIT FROM LOUISIANA, MO. SINCE 1816

Careful experiments were made with Delicious in all parts of the world. Some varieties succeed in one section, some in another. Some require a certain kind of soil. Some are adapted to a cold climate, others to a mild. Some are short season fruits.

But when the reports regarding Delicious began to come in, there was a revelation. For this apple appeared to be *perfectly* adapted to *any* conditions. From North, South, East and West came *one report,* and that was favorable to the Delicious as the *greatest* of all apples.

Stark Delicious is large, with a surface almost covered with brilliant dark red, blending to a golden yellow at the blossom end and over-flecked with small yellow dots. The blossom end is its characteristic feature—having five knob-like protuberances more or less pointed or rounded, depending on the section where it is grown. It is the one apple *trade-marked by nature.*

Stark Delicious is as hardy and sturdy as the oak. It is one of the strongest growing, most vigorous orchard trees, a strong pollenizer, a late bloomer; resists all tree enemies. The blossoms will stand several degrees more cold at blooming time than others.

In flavor, this apple is indeed *delicious.* Its flesh is of finest texture—smooth-grained, tender, juicy.

THE GREAT STARK SEAL.

Every package of Stark Bros. trees is carefully put up by experts and then sealed with the seal shown above. Stark Bros'. goods always reach you in good condition. *None are genuine without this seal.*

STARK BROS. GREAT SELECTIVE LIST.

Stark Bros. are the world's foremost tree growers. They grow all good varieties of apple and offer them in any quantity. Also all good varieties of peach, pear, plum, cherry, apricot, quince, nectarine, grape vines, blackberry, raspberry, gooseberry, dewberry, currant—everything the fruit grower wants. Shade and ornamental trees, ornamental shrubs, climbers, hedges, roses—everything to beautify your grounds.

THE SLEEP.

"He giveth His beloved sleep."—Psalm cxxvii, 2.

Of all the thoughts of God that are
Borne inward unto souls afar
Along the Psalmist's music deep,
Now tell me if that any is,
For gift or grace, surpassing this:
"He giveth His beloved sleep?"

What would we give to our beloved?
The hero's heart, to be unmoved.
The poet's star-tuned harp to sweep,
The patriot's voice to teach and rouse,
The monarch's crown to light the brows?
He giveth His beloved sleep.

What do we give to our beloved?
A little faith, all undisproved,
A little dust to overweep,
And bitter memories to make
The whole earth blasted for our sake;
He giveth His beloved sleep.

His dews drop mutely on the hill;
His cloud above it saileth still,
Though on its slope men sow and reap;
More softly than the dew is shed,
Or cloud is floated overhead
He giveth His beloved sleep.

—Elizabeth Barrett Browning.

*

A RECENT census of the Balkan States shows that the war there has reduced the male population of Bulgarian Macedonia from 175,000 to 42,500, while in Mustapha Pasha only 4,000 men remain, out of 33,000 before the war; in Thrace the men have dwindled from 494,000 to 225,000. This means that women and children must take up the customary labors of the men, and struggle against foes no less cruel than enemies in battle, for poverty, starvation and disease call for as much heroism as sword and gun. This has been the woman's part since war came into the world, and when we eulogize the field of glory, and hang medals and gold lace upon its heroes, we may well think long upon the toil-worn women, the prematurely aged children, who present the other side of the war god's shield.

*

A RECENT query was regarding silos for women farmers—whether it would not be difficult, if not impossible, for them to get the silage out. Dr. Katherine B. Davis, Commissioner of Correction of this city, in discussing her work at the Bedford Reformatory recently, made a statement about her charges there that has some bearing on this question. She said:

"We turn out good farm laborers, too, for our girls built a splendid silo at Bedford, built concrete walks and root cellars. They take care of the pigs and make the garden. People said, 'Aren't you afraid the girls will fall from the ladders, building that silo?' Well, I never could see why a girl should fall off a ladder any more than a man. There's no sex in climbing ladders."

*

HERE is a recipe for rabbit loaf from a Western reader, which will be found very savory: Stew the rabbit with two good slices of fat pork, one bay leaf, a piece of onion cut fine, until it can be taken from the bones. Reduce the liquor to two cups and add one-quarter box of soaked gelatine. Lay a few slices of hard boiled egg on the bottom of a plain mold. Season liquor with salt, half teaspoon pepper, one of sage, one-third cup vinegar and mix well with rabbit cut into small pieces with knife or run through grinder; set in cold place to harden.

*

A WARNING that may be added to other "safety" suggestions is conveyed by a recent case in this city. A baby playing with a celluloid rattle touched a hot kitchen stove with the toy, which caught fire immediately, and the poor baby was fatally burned before the flames could be extinguished. The extreme inflammability of celluloid is not always considered, yet there is a long list of serious or fatal accidents resulting from combs or other small articles of celluloid touching stove, or candle, or gas jet. Children should be warned of this danger, and it should always be kept in mind in the household, where so many celluloid articles are in constant use.

*

MANY people look upon collecting postage stamps as a harmless but extremely juvenile hobby. That it may be a very costly one is shown by the recent sale, in London, of a collection of British stamps made by the late Earl of Crawford; it sold for $80,000. Lord Crawford was president of the British Philatelic Society, and his collection of stamps was said to be second only to that of King George, who has been collecting since boyhood. The Crawford collection of American stamps which has not yet been sold, is of very great value, some single specimens being held at $1,500 each.

The Country Church as a Social Center.

"Meeting," is an appropriate word for the country church service. Last Sunday was a typical day at the little church near a "corner" with a half a dozen houses, mostly Summer homes, now deserted, clustered about it. Before the appointed time, 2:30 p. m., the people began to gather, and kept coming until three o'clock, and still no minister in sight. This was a service held at the "out appointment"; that is, this little band of church-goers have no resident pastor, although so-called union services are held each Sabbath in the pretty little church. One week the Methodist minister from a charge four miles away comes and preaches, alternating Sundays with an Episcopal clergyman living at C., six miles away. To the credit of these two good faithful men it may be said that not many services during the year are missed, although often, especially in the Winter season, roads are well nigh impassable, and the cold winds off the river here like blasts from the North Pole. On this particular Sunday the roads were deep with mud and snowy slush, and the young minister's old horse slower than usual. As the people waited, the gathering in the little church took on the appearance of a social. Neighbors and friends laughed and visited, and children and older boys and girls were merry and gay as could be. Occasionally some one would go out and look for the minister. Finally t 3:30 his coming was announced.

One little three-year-old who had become tired waiting was sent home with an older brother, and the rest of the congregation settled back in their pews orderly and sedate. The young minister came in frankly pleased to see so many out on such a "bad roads" day, thanked us for waiting so patiently and apologized for being so late, saying he had been two hours on the way. Old familiar hymns were sung, and with the accompaniment of the organ made sweet music, so heartily and unaffected by the old tunes were rung out. The brief sermon was a simple and plain discussion of a Bible truth applied to every day life.

After the benediction the people still lingered and seemed loath to go, talking with the minister and with each other, until the light of the short December day was almost gone. F. J. F. F.

The Guest Book.

I hope each suburban or rural woman has a guest book. It does not have to be an expensive affair, but just buy a neat and pretty blank book. Mine has a red leather cover, and I have written these lines in the front. They are indeed a quieting bedroom motto.

"Sleep sweetly in this quiet room,
Oh thou, whoe'er thou art,
And let no mournful yesterdays
Disturb they peaceful heart.
Nor let tomorrow scare thy rest
With thoughts of coming ill;
Thy Maker is they changeless friend,
His love surrounds thee still;
Forget thyself and all the world,
Put out each feverish light,
The stars are watching overhead,
Sleep sweetly then. Good night.

My book contains the names of all the over-night guests for 10 years, and it is a great pleasure to turn the pages and read the names. It brings a flood of pleasant memories as the visits of far away friends are renewed in the mind. I hope this hint will be strong enough to place a guest book in every guest chamber. CORA JUNE SHEPPARD.

Smothered Meats.

Smothered Veal.—Cut the veal in pieces convenient for serving and season with salt and pepper. Roll in bread or cracker crumbs and put at once into a hot frying pan in which are two tablespoons of butter and drippings mixed. Brown quickly on both sides and then cover closely. Put in the oven and bake 30 or 40 minutes, or until the meat is well done, according to the kind of fire. A very hot fire will cook it sooner.

Smothered Pork.—Take nice pieces of fresh lean pork and season well. Fry brown on both sides and finish in the oven. May be rolled in crumbs if liked. Make a brown gravy when the meat is removed.

Smothered Chicken.—Clean and joint a young chicken. Season with salt and pepper and roll in flour. Have ready three tablespoons of butter very hot and brown the chicken all over quickly. Be careful not to burn it. Cover and place in the oven for one hour. Make a cream gravy after the chicken is taken up.

Smothered Beefsteak.—Cut the steak in thick pieces for serving and pound well if tough. Season and roll in flour. Brown quickly in a hot skillet in mixed butter and fryings and then cover closely and finish in the over.

Smothered Beefsteak With Onions.—Peel one onion for each piece of steak and cut rather fine in slices. Put in a granite pan one hour before dinner with a tablespoon of butter and salt and pepper. Half an hour before dinner prepare the beefsteak by the above recipe and when ready to put in oven spread the onions over the top. Cover closely and and finish in the oven.

Smothered Beefsteak With Tomatoes.—Proceed as by the first recipe and when ready for the oven pour over the steak two cups of boiling hot seasoned tomatoes. Cover and finish in the oven.

Smothered Duck.—Clean and joint a young duck. Season the pieces and roll them in flour. Fry brown in butter and drippings. Add one half pint of boiling water and cover closely. Cook in the oven until done.

Smothered Rabbit.—Soak the rabbit over night in salt water and in the morning wash and season. Roll the pieces in flour and fry brown very quickly in hot drippings. Cover and finish in oven watching that it does not get too hot.

HILDA RICHMOND.

THIS WASHER MUST PAY FOR ITSELF

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse. But, I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right, but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse wasn't "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse although I wanted it badly. Now this set me thinking.

You see, I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see, I sell my Washing Machines by mail. I have sold over half a million that way.

So, thought I, it is only fair enough to let people try my Washing Machines for a month before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six minutes. I know no other machine ever invented can do that, without wearing out the clothes.

Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman and it don't wear the clothes, fray the edges nor break buttons the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight, too. Surely that is fair enough, isn't it?

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months, in wear and tear on the clothes alone. And then it will save 50 cents to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in 6 minutes.

Address me this way—H. L. Barker, 200 Court Street, Binghamton, N. Y. If you live in Canada, address 1900 Washer Co., 357 Yonge St., Toronto, Ont.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.

Wash Mellotone Walls and They Are Bright As New

"You can't imagine how much prettier and more cheerful our rooms have been since we took off the wall paper and put on

Lowe Brothers High Standard Mellotone

"It is far more artistic and beautiful than wall paper or calcimine. The rich, delicate Mellotone colors—soft as the rainbow tints—are a lasting beauty."

Mellotone saves money

because it is so wonderfully durable. It is not easily scratched or marred. The colors do not fade. It makes house cleaning easy. Instead of the muss and work of papering or calcimining, you wash off Mellotone walls and they look bright as new.

There is only one Mellotone

It is sold only by "High Standard" dealers, who also handle "High Standard" paints, varnishes, enamels, etc. If you don't know our dealer nearest you, write and let us tell you his name.

Valuable books Free

Write for "Harmony in Colors," showing the beautiful Mellotone colors. Also our books, "Mellotone" and "Homes Attractive." They are free—write for them today.

The Rural Patterns.

When ordering patterns always give number of pattern and measurement desired.

8117 Child's dress, 4 to 8 years. With long or elbow sleeves, with or without bloomers. 8107 Child's dress, 1, 2 and 4 years. With round or high neck, short or long sleeves. 8096 Girl's low belted dress, 8 to 14 years. With long or elbow sleeves, with or without shield. 8119

Boy's suit, 2 to 6 years. With or without stock collar, with long or short sleeves. 8095 Child's dress, 2 to 6 years. With round or high neck, or long or short sleeves.

8130 Loose coat, small 34 or 36, medium 38 or 40, large 42 or 44 bust. 8112A Russian blouse coat, 34 to 40 bust. 8100 Coat with kimono sleeves for misses and small women, 16 and 18 years. 8427 Girl's coat in sports style, 10 to 14 years.

In three-quarter or full length. 7395 Child's double-breasted coat, 1, 2, 4 and 6 years. To be buttoned up closely or rolled over to form revers, with or without cuffs and pockets. Price of each pattern 10 cents.

Corn on the Table.

Corn is so rich in oil ("fat" in the scientific terminology) that it is a particularly good food for the Winter months, and especially so for those who are much out of doors. But it is well, at times, to introduce a variety into its uses, so that it will not pall upon the taste. The following are specially good recipes from my mother's cuisine, most of which I have never seen elsewhere:

Corn Bread.—Indian meal, yellow, one cup; flour, sifted, two cups; one-half yeast cake; shortening (lard or pork), one-half cup; salt, teaspoon. Scald the meal with two cups of boiling water, stir until thoroughly mixed, then cover. Put the one-half yeast cake into a cup of water, while you sift the flour into a mixing bowl with the salt. Add the yeast and water. Mix all into a sponge. When light, about four hours later, add the meal, stirring thoroughly. Melt the shortening and add that, mixing all. Cover, and let it rise. Pour into hot baking tins that have been well greased, and bake in a quick, but not too hot, oven, 30 to 40 minutes, more rather than less especially if the heat varies. Good cold or hot, for any meal.

Hulled Corn.—One quart cracked yellow corn; one teaspoon baking soda; plenty of water. Wash the corn several times. Put it in a kettle with the soda, and cover with water two or three inches above the corn. Bring to a boil, and stir often. Then cover, and let it simmer two hours—or longer. Drain off the water and rinse, rinse, rinse. Cover again with water, and with the kettle cover, and again bring it to a boil. Set it back, tightly covered, after salting to taste, and let it cook, cook, cook, four hours or more—when it is ready to dish up and eat with milk or cream as a cereal, or with pork fat or butter as a vegetable.

Johnny-Cake Crisps.—Two cups yellow meal, one cup sifted flour, one egg, one cup milk, two cups boiling water, one-half cup shortening, one tablespoon sugar, one teaspoon salt, three heaping teaspoons baking powder. Scald the meal with the boiling water; cover, and let it stand to swell. Sift the flour, salt, sugar and baking powder together, and mix thoroughly with the milk. Melt the shortening, and add it. Beat the egg, then heat the batter and add the scalded meal. Pour in thin layers on well greased tins, baking in a hot oven until it is a stiff brown crust, with but little "soft" middle part. Break into small pieces while hot, and serve in bowls of rich milk; or, in hot milk gravy on plates.

Parched Cornmeal.—Parch the corn, instead of popping it, by holding over a slow fire. When dried through, as it must be, to get just the right taste, cool it and grind moderately fine in the coffeet mill or the meat chopper. Salt it, and serve in milk as a cereal, with or without heating.

Corn Coffee.—Brown the corn in a hot oven, until a deep brown. While hot add a teaspoonful of butter to each pint of cornmeal, after grinding as above, but coarser. When cool, break an egg, shell and all, into each quart. Make and serve as you would ordinary coffee.

Cornmeal Mush "Butter Cakes."—Make the mush as usual, one cup meal to three of salted water, cooking slowly after it begins to boil, but stirring constantly to keep it smooth, until it is ready to "simmer." Then add an egg, a cup of sifted flour, and half a cup of butter, stirring all thoroughly. Cover and let it sit on the back of the stove half an hour. Turn on to buttered pie plates, filling each near to the top. Smooth off the surface and let it cool. When cold, cut with a small biscuit cutter into rounds, which fry on a well buttered griddle or in deep fat, according to taste, and purse, a light brown. Cut open while hot, to butter, or serve with syrup or honey without cutting. Daintier if baked on buttered tins, in a hot oven.

LUCY A. YENDES.

Dried Apple Pie.—There is no reason to be contemptuous of dried apple pie if it is made after this recipe: Stew enough dried apple to fill one pie until tender; it is well to soak the fruit first. Press through sieve, sweeten to taste, add a small lump of butter and one-fourth teaspoonful dried cinnamon. Line a pie tin with paste, bake lightly, then fill with apple, cover with a meringue made by beating the whites of two eggs with three tablespoonfuls of sugar, and brown in a moderate oven.

Oatmeal and Peanut Macaroons.—Mix two and one-half cupfuls of rolled oats, one cupful of sugar, two eggs, beaten separately; one tablespoonful of melted fat, two teaspoonfuls of baking powder, one saltspoonful of salt, one teaspoonful of vanilla and one cup of shelled peanuts, chopped fine. Flour the hands and make in small balls, place on buttered baking pans some distance apart (to allow room, as they spread out flat). Bake, taking care not to burn. These are very good.

Wheel Grease
FROM HANDS AND ARMS
Quickly Removed

A brisk rub with a sprinkle of "OLD DUTCH" cleans quickly and thoroughly — leaves the skin soft and smooth.

Don't Be Without It — 10¢ LARGE CAN

MEN'S 4-Buckle ARCTIC SNOW EXCLUDER

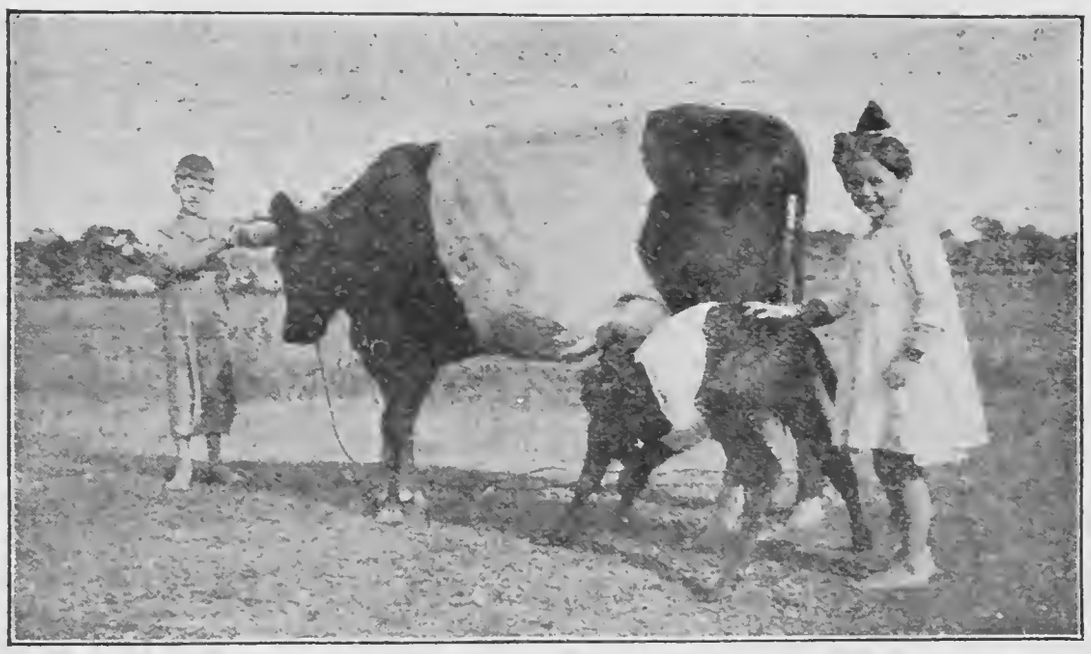
Live Stock and Dairy

BREEDING OUT DEFECTS.

It is an axiom of breeding, or heredity, that "like produces like," or tends to do so, and that is true; but it is not the case that nature tends to strike an average or effect a "happy compromise" between too markedly unlike items of conformation or temperament. This is not commonly understood by the stock-breeder who has not made a special study of this perplexing subject.

Poor feet and badly-formed hock joints are two most common faults of the horses we breed upon the farm. How shall we get rid of these objectionable features of our horses? Not by breeding to sires that have directly opposite features. That is the common plan of procedure, and it is erroneous. The common sense, logical and correct procedure is to employ sires as nearly perfect as possible in the points deficient in their mates. It is an even better plan to discard at once the mares that have the objectionable features and breed from those having the desired conformation, mating them with sires of like desirable conformation.

To make this more plain it may be stated that when a man finds that the horses he breeds have small, poor quality feet (hoofs) his plan of corrective action too often is to mate his mares with a stallion that has abnormally developed



BELTED COW AND CALF.

feet. Such feet are as objectionable as feet that are too small. Two objectionable types of feet, wholly dissimilar in type, will not in the foal be reproduced as an average between the two types. In other words, the too big and the too little hoofs will not blend and make correct size hoofs in the offspring. Two wrongs do not blend to make a right, but one right and one wrong may partially offset each other. If one right is stronger (by breeding) than the wrong the resultant blend of the two may, but does not surely, favor the right. The correct way to attempt righting of the wrong, i. e., improving the small weak feet, is to use a stallion that has the most perfect feet possible and that owns such feet because of ancestors that had like desirable feet. The best plan from the start is to select mares having the right sort of feet and mate them with stallions having the same sort of feet, or even better feet, if that is possible. In breeding horses we have found that it is a slow, uphill, disappointing matter to breed out faults by the use of sires not possessed of those faults. This applies to the breeding of better feet, but more especially to the improvement of badly formed hock joints.

A fine, large, pure-bred Percheron mare that was well-nigh ideal with the exception of having hocks that approached the sickle type, or curby formation, was mated each Spring with a purebred Percheron stallion. Each of these stallions had hocks of correct conformation and in one instance hocks of the somewhat too straight type. Each foal from this mare so mated grew up with hocks like those of the dam. Some of the offspring had hocks of more accentuated curby formation than those of the dam. All of them had objectionable hocks in this particular. We knew the sire of the mare in question. He was a noted Percheron stallion 20 years ago, but his hocks were objectionable, being weak in conformation, somewhat of the sickle order and one of them showing a small bone spavin. The mare inherited poor hocks from the sire. No doubt he in turn came by such hocks through heredity, and the wrong shaped hock in this family is so strongly bred in the "breed and bone" that life is too short, apparently, successfully to obliterate it by selective mating. We got rid of the mare and most of her female progeny, and other mares of better type have been installed in their place.

Based upon actual, extended practice and observation we have no hesitation whatever in advising readers of THE R. N.-Y. never to buy or employ a mare for breeding purposes that has a bad fault or conformation, with the hope that in time the offspring may be made free from that fault by use of sires of opposite type, not having the same fault, and even extraordinarily excellent in the opposite direction. This advice applies with equal force to the breeding of animals other than the horse. Faults of conformation cannot readily be bred out. In all instances, for quick results and satisfaction in breeding, decide upon an ideal animal to be produced, start with a female or two as nearly of that type as possible and continuously mate with sires of that chosen type. Discard every female that does not approximate the chosen type and, so far as possible, only retain as breeders the ones that are above average in the desired type. Do this also in the selection of sires and there will be good reason to expect that the progeny of such animals will retain the desired type and possibly improve in that respect, if improvement is possible.

Remember that quick results for the better cannot come solely from one side of the breeding equation. The nearer the two factors in the equation are alike at the start the more certainty will there be in obtaining the sort of stock desired. Gradually by continued grading-up, by the use of purebred sires, the type and character of the pure parents become dominant; but all the while the warring element from the dam's side and ancestry seeks ascendency and lessens permanency of improvement. For quick results never start with widely diverging types, or violent opposites of blood.

In conclusion, to clench the idea here advanced, let it be said that we have known many men to fail in horse breeding because they bought a lot of cheap, foot-sore mares in the city and used them as a breeding battery on the farm, hoping and trying, for a number of years, to attain improvement and success simply by the use of good sires and good feed. Better and quicker results would have been had by starting with one ideal well-developed brood mare of the type desired, and mating her and her female progeny in turn, year after year, with the same sort of purebred, rightly formed sires used with disappointing results upon the city mares of the wrong type.

A. S. ALEXANDER, M. D. C.

HE was an old-fashioned father, and he said to the young man: "Are you sure you're able to give my daughter the comforts and luxuries to which she is accustomed at home?" The young man promptly replied: "As your daughter's salary has paid the rent and bought most of the clothes and food for your family, I think we can worry along."—Cleveland Plain-Dealer.

Use the *Available* Kind of Fertilizer

For many crops all the *available* plant food that is needed is one grain to each pound of soil.

When such a small quantity of food must do all the work for your crop, it is exceedingly important that what you put into the soil in the form of fertilizer shall be *available*—that it shall have not only the right quantity, but the right quality and right crop value.

It has cost us forty years of experience to know how to mix the right kinds and the right quantities of ingredients for fertilizer.

Bowker's Fertilizers

accomplish also the more difficult task of getting the right blending, the right solubility into a mixture which will run readily and freely from the farmer's planter, and which will remain dry and drillable as well as efficient until used in the field. We make a brand to fit every crop need.

Write and tell us what your crops are, and we will send you our illustrated catalogue.

SWINE IN TRANSIT.

Common sense and good judgment are commodities most of us are not overstocked with. This brief epistle is written as a reminder of a few facts that would save a pretty penny each year to the good farmers of this nation if heeded. A farmer reads the advertisements in his paper; he decides he is in want of a hog, it may be a boar ready for service, a bred sow or a young pig at weaning. The information in advertisement is usually limited; therefore he writes a letter of inquiry to the breeder, and in due time gets description and prices. Then he orders and sends his good money, and in a short time he goes to the express office and gets his swine, takes it home, uncrates it, and now is where the good advice and forethought comes in play.

A good breeder has a comfortable house for his swine. When he receives an order he selects the hog or hogs that are to be shipped, crates them, and if it is a Winter month he covers the crate with a heavy blanket, and transfers them to the shipping station, bills to the purchaser and sees them safe aboard the express car, which is warm and comfortable. Of course all roads do not lead direct to the destination; therefore the hog has to be transferred, and he is taken from the car and put on the truck and transferred to the other road. Here is an exposure. Again at the destination, is another exposure. The good farmer comes and takes the hog home; the distance may be short or several miles; again there is an exposure. When man or beast has periodical exposures to different temperatures he is liable to take cold, and that means a congested condition of the system. If a hog takes cold he is at once costive, refuses to eat, only a little if anything. Exposures have killed more good hogs than cholera.

Do not take a hog from the station home without covering the crate with good warm dry blankets. Don't turn the hogs in with strange hogs. When uncrated, give a hog the following: Take one quart of water with chill taken off, add one quart of milk, dissolve two ounces of epsom salts and a teaspoonful of common baking soda, and add to milk and water, and let the hog drink it. Give the hog a warm dry nest of straw and let alone, for, say 10 hours. In the meantime he will have consumed the above prepared drink this will cool the system and remove the congestion, regulate the bowels. By this time the hog has got over the car sickness, nervous system has become normal and he is ready to make his new habitation a pleasure. Now feed light for a few days, and the hog will come to his appetite.

New York. EUGENE I. BLACK.

A Good Bull.

"A bull is half the herd." It has been well settled in minds of breeders that the best bull is none too good to put at the head of a herd. There are still farmers trading around the neighborhood just to get a bull calf. The matter of family history receives no consideration, just so inbreeding is avoided. Now inbreeding has been found to emphasize dairy tendencies and the greatest breeders are practicing it to such extent that it would have made farmers a score years ago raise their hands in protest. If a herd is ordinary and a bull is secured from a herd of excellent performance, that bull will be far more than half the herd. He may go as far as to be 80% or 90% efficient. We had paid but little attention to bulls when a few years ago, a grade bull of remarkable prepotency was secured. He stamped his characteristics on the dairy to such a remarkable extent that he seemed to send our herd up grade on the high-speed gear.

Bulls are cheap. Bulls from the best families may be secured from breeders at low cost, while heifer calf prices are going after altitude records. There is no need dickering for a bull calf with no ancestry, when by consulting the advertising columns, one may get in touch with the best available stock in the various breeds. A dairyman will sooner or later be judged by the bull he keeps and the manner in which he keeps him. W. J.

PECKHAM: "Gee, what biscuits. I wish I was an ostrich." Mrs. P.: "So do I. Then I'd get some feathers for my hat."—Life.

Angora or Chinese Goats.

I have about 25 acres of land; the side hill is wooded and slopes off to low land with lots of wild grass. Most of it is fenced off with seven-foot fence. Do you think it would be advisable to put in Angora goats? Do you know where I could get any and are there any Chinese goats bred in this country?

Norfolk, Mass. G. W. D.

We doubt if Angora goats on this small field will pay. A flock of good grade sheep would clean up the field and give returns in meat and wool. We do not know about the Chinese goats.

Trouble With Silo.

What is the trouble with my silo? It is built of tile blocks 12x50, and the silage rots all around about six inches deep. At the doors where it touches the wood it does not rot, and it freezes about 2½ feet deep all around. I have lost three tons and more, but farther down it seems to be better. C. M. H.

Newtown Falls, O.

Your experience with a tile silo is, so far as I know, an unusual one, and I cannot account for the rotting of the silage where it touches the walls, unless you failed to tramp it well against the walls when filling. If this is not done silage is apt to lie up loose around the edge in any silo and spoil because of air obtaining access to it. The fact that the silage toward the bottom of your silo where it was packed by the weight of that above is in better shape than the upper layers would indicate that this might be the cause of your trouble. M. B. D.

Calf Feeding.

You have asked for milk substitutes or part substitutes for feeding calves, to which you have some good answers. We raise fruits and vegetables and do not profess to know much about stock, but like milk, butter and some good beef, therefore I am interested. My simple and maybe old-fashioned way worked well for us, and we killed a nine-months-old calf the other day that dressed 250 pounds. The calf fed itself in the natural way until the milk was good for humans. Then by the time it was hungry enough to drink readily it was given warmed milk which was gradually let stand a little longer and longer before skimming, until it was getting entirely skim-milk at about the end of the second week. Then white middlings were stirred into the warmed milk, only a very little at first. The middlings was increased slowly and finally water was often added when the family wanted more milk, but the calf grew right on, ate hay and in Summer was tied out to pasture at the end of a 30-foot chain, but always watered and fed regularly. This way of feeding was kept up till butchering time or almost, and the calf always seemed to prefer it to dry feed. Not over two quarts of middlings was given at a feed. We were careful to have the feeding vessel scalded out frequently, especially while the calf was small. The meat is solid, fat and tender, and as middlings is a feed that can always be readily bought at a medium price, is simple to prepare. This seems to fill the bill for our calf feeding. T. L. W.

On page 27 H. G. P. inquires the best way to rid hogs of lice. There is no better, easier or cheaper way than to take Persian insect powder and sprinkle along on their backs when the hogs are eating at the trough, and if you can rub it into the hair a little all the better. After two weeks go over them again, as some will have hatched since, and to make certain of a clean job, go over them again later. I have treated 200 head at a time and have never known it to fail. It will drive the vermin from calves in the same way. Dipping hogs in the Winter is not a desirable job. A. R. P.

Honeoye, N. Y.

"Blood Will Tell"

The youngest daughter of Sayda's Heir 3rd, 74817, to complete a year of authenticated work began at two years two months of age, and produced 8,365 lbs. milk, 360 lbs. butter.

His five-year-old daughter last year gave 10,682 lbs. milk 706 lbs. butter—her third consecutive authenticated yearly record.

His full sister at eleven years old gave 11,433 lbs. milk, 809 lbs. butter, her two daughters and herself averaging 740 lbs. butter each per year.

That dairy quality is born in Sayda cows is indicated by the fact that twenty-one of them have completed yearly tests at Meridale Farms with an average yield of 8,651 lbs. milk, 586 lbs. butter. They have an average official score in excess of 90 per cent. of perfect scale of points.

A recent purchaser of a son of Sayda's Heir 3rd writes: "The bull came at noon today in good condition. He is a fine little fellow, and we are *very much pleased* with him."

Several other sons of Sayda's Heir 3rd, out of Register of Merit dams, are now approaching serviceable age. Their purchasers take no chances on unknown lines; our records show proven production back of them for generations. For pedigrees and particulars address

Best for Man and Land

A Great Improvement

The One Spreader Saves Strength of Manure

It is a well known fact that thin or liquid manure has the greatest fertilizing value—it is much more valuable to land than dry or rotten manure. The wetter it is, the better; every load of it is worth gold dollars to the farmer as soon as it is spread on his land.

There are many manure spreaders on the market today but they are so constructed that practically all of this valuable thin manure is wasted before it reaches the field.

The Flying Dutchman Spreader
NO. 14 NEW ENGLAND TYPE

is so constructed that it **saves** this material and enables the farmer to spread it just where he wants it.

It is a Low Down, Easy to Load, Endless Apron Spreader built with a **level** body and an **Automatic Tail Board** which prevent the thin manure from running out behind and wasting.

Load your spreader right from your barn, spread it while it is fresh and has its full liquid strength.

This spreader is unusually light draft, the rear wheels are **under the load** insuring perfect traction. It has steel frame, steel wheels, steel beater and the apron runs on three sets of hardened steel rollers.

It is very simple in construction—simple to operate—one lever does everything. A small boy can easily handle it.

Let us send our **Free Folder** and our 1914 Almanac. Write today.

Ask any **Flying Dutchman** Dealer about the **Flying Dutchman Spreader No. 14.**

NEW YORK MOLINE PLOW CO.
Dept. 119 POUGHKEEPSIE, N. Y.

MOLINE PLOW CO.
Dept. 119 MOLINE, ILL.

SKUNK FARMING IN NEW YORK.

[We have for years advised our readers to keep away from "skunk farming." It was recently reported that five skunk farms have been licensed in New York State. So we wrote the Conservation Commission about it, and this is the report. Mr. Legge makes it appear easy and fragrent of profit, but the business carries no temptation for us.]

This Department has issued five licenses allowing the possession of skunks for propagation purposes in the State of New York. Skunk raising is not well understood, and the people who are conducting skunk raising are not successful because of the fact that they are not familiar with the proper method of caring for the skunk and its young.

The question always asked when skunk farming is mentioned, is concerning the difficulty of conducting such a business in any reputable neighborhood on account of scenting. Contrary to popular expectation, the skunk appears to be least objectionable of all ranched animals, the fox being the most objectionable. One might pass alongside a hundred skunks and not observe any odor. They can be easily handled, and by cutting out the scent glands when they are about 10 days old they will be deodorized. The operation is unnecessary, and is not harmful to the animal.

Of course, the skunks are graded according to the proportion of white hair on the skin; as No. 1 with no stripes or very short ones; No. 2, with longer stripes, and No. 3 when the stripes extend the full length of the body. It is probable that the rapidly advancing prices in 1912 will be the means of stimulating the skunk-raising industry. No. 1 northern skunk brings $4.25 at present and, if this price continues, there is a large profit to be made in skunk-farming.

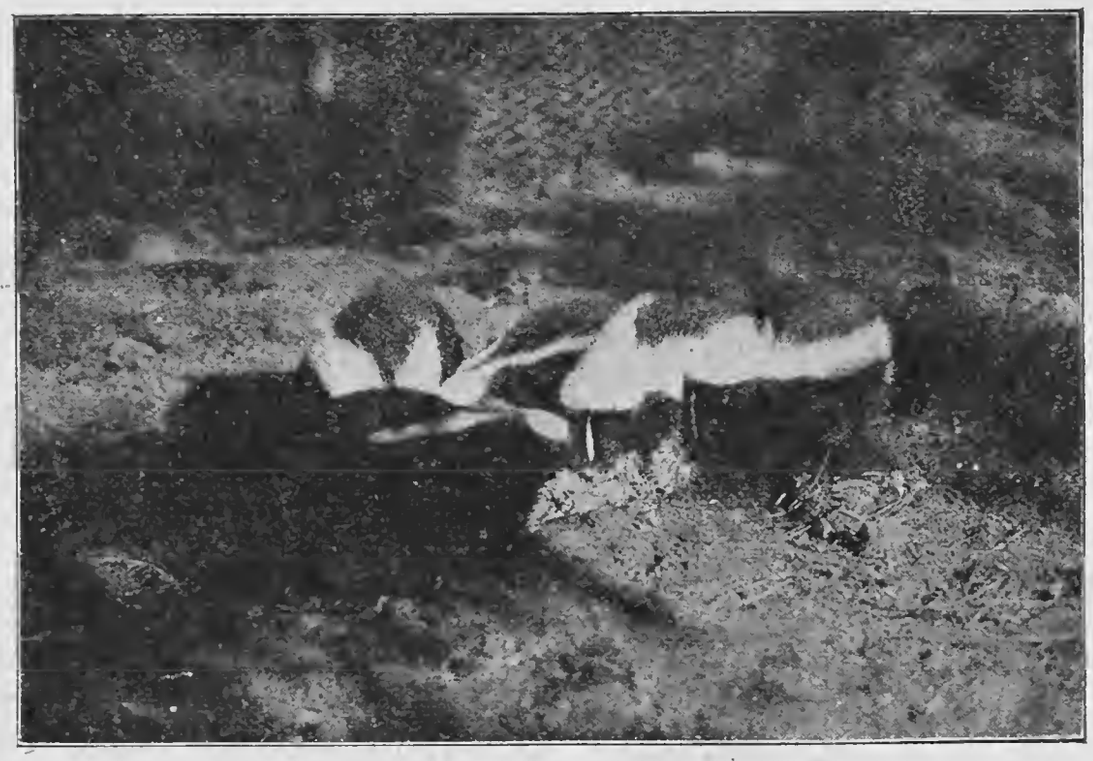
Skunks can be kept in captivity under conditions similar to those recommended for mink, i. e., in pens. The males will not injure the females, but the females will kill the males after mating if they are kept enclosed with them. The females might be kept in pens, after mating and while rearing the young. A wide range is necessary in order to permit of their securing a variety of natural food. Skunk raising will prove a failure if done on a small scale, while on a large scale, it would be a paying business. One of our correspondents writes that "the first season he had 12 females and three males, all black; the average litter of young was from three to six; the average grade, about 85 per cent. black, the balance being Nos. 2, 3 and 4."

Naturally, skunks live in holes in the ground, rocks, trees, stumps, etc. Their food consists of mice, birds, bugs, crickets, grasshoppers, bees, wasps, yellow-jackets, angleworms, seeds, berries, ground roots and bark. There is a great disadvantage on starting on a small scale. If you have a large number of skunks in a small place it will cause them to crowd and fight and kill one another, while to have a separate pen for each female is expensive. After the rutting season the female will kill the male, apparently to protect her young. Skunks are liable to fatal diseases, similar to sore throat or diphtheria. The female skunks which have had no young are known to take the young of other mothers to their boxes, and fight the real mothers away until the kidnapped young starve to death. Others that have had young would steal the young of two or three others and then, having more than they could care for, some would starve. Another disadvantage in a small enclosure is that they get so tame they come out in the daytime to feed and the exposure to sunlight fades the fur to a certain extent.

As it is almost impossible to supply a lot of skunks with the kind of food they get in the wild state, it becomes necessary to substitute some other kind of food, such as dead horses, cows, chickens, corn and various other things which a man with a small lot cannot always have. If not fed properly they become cannibalistic. Skunks can be raised as easily as house cats, provided you have an enclosure where they cannot dig out or climb over. For every hundred mature skunks, you should have an acre of ground enclosed.

I know where one man experimented for three years on a small scale. The first year he had one male and three females. They brought forth 15 young. One of the young died. Five of the young graded as No. 2, the balance star black.

The gestation of the skunk is about six weeks, and runs from four to nine in a litter. The young come out to eat when two months old, and can be admitted to the general run when four months old. A strict diet of meat will kill every skunk. They should be fed once a day in the evening. If the bodies of the skined animals are fed, they should be thoroughly boiled with vegetables. The oil rendered from the skunk fat is valuable.



A GATHERING OF FRIENDS IN FUR.

There are different methods of killing skunks. One way is by drowning. They can also be dispatched easily and painlessly in a poison box, using carbon bisulphide gas or hydrocyanic acid. The latter is a deadly poison and is very dangerous in the hands of an inexperienced person. They can also be killed by a blow over the back, which paralyzes the muscles and destroys the power to scent. They should be skinned by the case method. The skins should be carefully cleaned of fat to prevent heating and should be packed separately for shipping. LLEWELLYN LEGGE,

Chief Protector Conservation Commission.

Contagious Abortion.

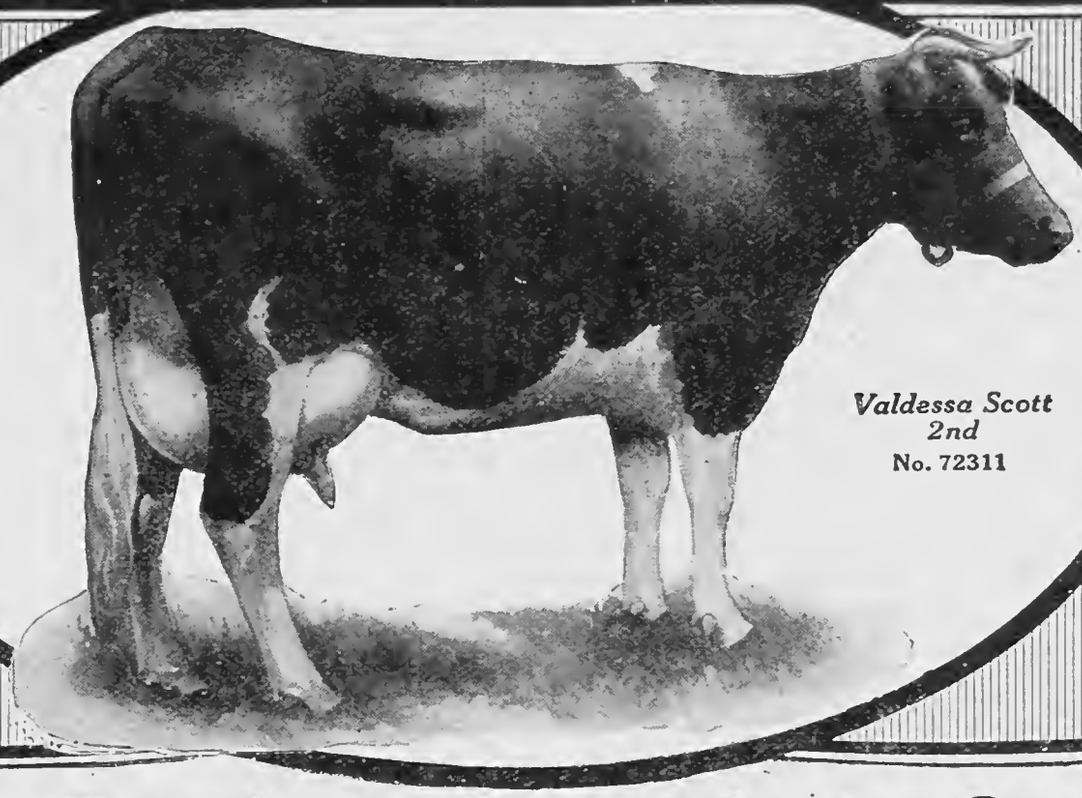
One of my cows and two young heifers have recently aborted. I fear for the rest of them. have bought no cows for two years, have fed silage almost exclusively for the last month to the heifers. It has a few moldy spots in it, presumably from being too ripe and not packing quickly. Could the silage cause it? P.

Pennsylvania.

Most silage will contain a few moldy spots where air has gained access to it, either from insufficient packing or leaky silo walls. Unless of considerable extent, I have never known these to do any harm and do not think it possible that the silage can be responsible for the abortion in your herd. It is more likely that the germs of contagious abortion have in some way gained access to your herd, possibly through the use of an infected bull. If you are within reach of a competent veterinarian, I would suggest that you have him prescribe the new methylene blue treatment for your cows as described on page 1168 of the October 25 issue of this paper. M. B. D.

Greatest Cows in the World

Valdessa Scott 2nd.
Beat All Ages All Breeds of The World



Valdessa Scott 2nd
No. 72311

Valdessa Scott 2nd.
The First 40 Pound Cow in The World

Smashed All Previous Records to Smithereens!

Take off your hat to Valdessa Scott 2nd—the *"Wonder Cow"* of the world. She certainly is entitled to such recognition. She has more than done herself proud and accomplished a feat **never before** attained by any cow in the world of any breed or age.

In thirty days' test she produced 2933.9 pounds of milk and 165½ pounds of butter. Her one day record is 108.6 pounds of milk and 6 pounds of butter.

Her one week record (7 days) is 695.1 pounds of milk and 41.875 pounds of butter. What do you think of that? Remarkable! Phenomenal! Unparalleled! Her milk tested 4.70 per cent butter fat.

All of the above tests were conducted by W. D. Golding and Prof. Alfred S. Cook, of the New Jersey Experiment Station. Naturally you wonder—what sort of ration was fed. Here are the words of her owner—he tells it in a letter just received.

Finderne Stock Farm, Finderne, N. J.

THE QUAKER OATS CO., Chicago Ill.
Gentlemen: During the past two or three years we have been feeding your SCHUMACHER FEED and have secured splendid results. SCHUMACHER was incorporated in the ration fed Valdessa Scott 2nd during her wonderful result-producing test. Used as a base with a good protein concentrate it is a winner. Yours truly, B. MEYER, Owner.

SCHUMACHER FEED

Now read what the owners of other World's Champion and World's Record Breaking cows have to say of this wonderful feed.

Springvale Stock Farm—Home of Colantha 4th's Johanna.

THE QUAKER OATS CO., Chicago, Ill.

Gentlemen:—Replying to yours of the 3rd we are making **Schumacher Feed** one-third part of our herd ration and we are getting results. Several of our cows are milking up to over 75 lbs. per day with this as part of our grain ration.

Yours very truly,
W. J. GILLETT.

Rosendale, Wis.

Brookline Farms—Home of Johanna DeKol Van Beers.

THE QUAKER OATS COMPANY, Chicago, Ill. Hampshire, Ill., Dec. 8, 1913.

Gentlemen:—Replying to yours of December 1st, regarding Schumacher Stock Feed, will say as a feed for dairy cows or young cattle I know of no feed equal to Schumacher. It certainly contains all the ingredients that are necessary to put the finish and gloss on an animal and more than that, the results obtained through the pail makes it the cheapest feed that I have ever fed. To any one feeding cattle for show, I would especially recommend Schumacher. Johanna DeKol Van Beers, the forty pound cow and her son Johanna McKinley Segis; Pontiac Korndyke Maid, A. R. O. 33.75; Belle Segis, A. R. O. 32 lbs.; in fact, all of my cows, and I have ten with records above 30 lbs. in 7 days, are fed every day a ration of Schumacher Stock Feed. My advice in a few words is, "Buy Schumacher and grow fat and slick."

Yours truly, T. E. GETZELMAN, Proprietor.

Colantha 4th's Johanna
Owned by W. J. Gillett, Rosendale, Wis.
is the champion long-distance cow of the world. Her official record for 365 days is 27432.5 pounds of milk, and 998.26 pounds of butter fat.

SCHUMACHER FEED is composed of finely ground, kiln-dried corn, oats, barley and wheat products, giving just the variety, balance and appetizing flavor which your cows relish so keenly. They will lick it up greedily, digest it easily and won't get "off feed" as they do on rations that do not have this necessary variety. For heavy, steady milk production without injury to the cow the following **Schumacher Feeding Plan** has no equal. A trial quickly proves our claims.

Try This Feeding Plan NOW

Mix three parts of Schumacher with one part of any good high protein concentrate you are now feeding, such as Gluten, Cottonseed Meal, Distillers' Grains, Oil Meal, Malt Sprouts, Blue Ribbon Dairy Feed—and note the results. You will be surprised at the increased yield—how eagerly your cows eat it and thrive on it—how their condition improves. It affords that much needed variety of grain products which you know are so essential and also that **Stamina** so necessary to withstand "forced" or heavy milk strain. There's nothing like it—nothing can touch it for results and condition.

JOHANNA DEKOL VAN BEERS
The Second 40-lb. Cow—and her smashing 60, 90 and 100 day tests

	MILK	BUTTER
60 days	5,552.00 lbs.	290 00 lbs.
90 days	8,147.90 lbs.	418 13 lbs.
100 days	8,987.40 lbs.	460 19 lbs.
120 days	10,490.00 lbs.	540.97 lbs.
7 day Record	663.00 lbs.	40.32 lbs.

Here is Your Opportunity

Never since you started in the dairy business have you had a better opportunity to make big money from your cows. Conditions are especially favorable right now. Crowd your dairy to the limit—coin money while you can. **Milk prices are good—feed prices are low,** especially if you follow the Schumacher Feeding Plan endorsed by the owner of Valdessa Scott 2nd and other successful dairymen. Try it now. See for yourself how it will increase your milk yield and cut down the cost of your feed. Order Schumacher at your dealers' today. Don't put it off.

Get it at Your Dealers

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

Criticism of Ration.

What is your idea of this feeding ration for Holstein cows? Small feeding of hay in the morning, a bushel of silage at noon, all the straw they can eat at night, and eight quarts a day of grain mixed as follows: 300 pounds bran, 200 pounds hominy, 100 pounds gluten, 50 pounds cottonseed meal. P. H. M.

Copenhagen, N. Y.

If you would use 200 or 300 pounds of cottonseed meal instead of 50 it would be an improvement; that is, if your cows are not soon to freshen; if they are, you are feeding enough cottonseed. Straw is not the best kind of roughage for milk production, but when hay is in short supply, and high in price, and milk bringing a low figure, it sometimes seems advisable to feed some straw. Your ration as it stands is good, and I can make only the above criticisms. C. L. M.

Specks in Buttermilk.

What is the cause of specks in the buttermilk that look like cream, and is there any remedy for it? H. L. J.

These specks are what are called "false butter," and are composed of hard curdled milk. You are likely to find some of them in the butter also. They are prevented by frequent stirring while the cream is souring so as to keep cream and milk mixed. It may also happen, especially where milk is set in shallow pans, that the top of the cream becomes quite dry, and small particles will continue to stick together during churning. In any case frequent stirring of the cream will prevent this to a great extent. C. L. M.

Poor Milk Yield.

A neighbor has a Jersey cow, fresh December 22, perfectly well but only gave one quart milk at first, now gives three quarts. Will the cow ever give a full flow of milk until fresh again? She fed the cow one quart bran and two quarts chops before the freshening, and thinks the chops might have caused the cow to fatten and may be the cause of the decrease in milk flow. The cow is seven years old and has always given 2½ to three gallons milk a day. Will you advise what is best to feed to increase milk flow? E. S.

Springfield, Mo.

I would not be able to give more than a guess as to what is the cause of this cow's small milk [illegible]. I should not expect that the grain given would cause any trouble. The term "chops" is a little indefinite, but I take it to mean corn and oats ground together. As the cow is gaining in milk flow I presume she will be all right soon. It is my experience that cows will occasionally fail to give as much milk as they ought at first, but after two or three weeks will come to their normal flow. A few years ago I had a heifer which as a two-year-old had given unusual promise, but on freshening the second time gave no milk at all for several days. However, I went through the process of milking several times daily, and soon the milk started. On being turned to pasture she gave a good amount of milk. In no such case have I been able to assign any definite cause. C. L. M.

Dairy Ration.

You advise a dairy ration of three pounds wheat bran, three pounds cottonseed meal, and one pound cornmeal. Is that for one cow or more and how often do you give it a day? How would you feed 10 milch cows? Do you feed that ration dry or wet? Where can I get feeding molasses? S. D. S.

Bethlehem, Pa.

The ration given is for one cow, and for one day. However, it is generally better to divide the grain ration into two parts and feed at two different times, say morning and night, or morning and noon. A convenient way is to mix, say, 300 pounds of bran, 300 pounds cottonseed meal and 100 pounds of cornmeal. Then weigh out into your feeding dish one, two, three or four pounds of the mixture, and notice about how full the dish is for each amount. Then you can feed accurately enough for practical purposes without bothering to weigh each time. I may say that the ration you mention is intended for a cow giving 25 to 30 pounds of milk daily. Feed each cow according to the amount of milk she gives, and this should be three to four pounds of milk for each pound of grain. The grain should be fed dry.

Probably your grocer or feed dealer can get the feeding molasses. If not it is advertised in THE R. N.-Y. It should not cost over 17 or 18 cents per gallon, by the barrel. The best way to feed it is to dissolve about a pint for each cow in hot water, and sprinkle over the fodder. Probably it will not pay to feed molasses to cows, unless you have some kind of fodder that the cows do not like very well, as straw or dry corn fodder. As to Alfalfa, most feed dealers keep it, cut or ground fine, but generally the price is too high to feed to cows. If you can raise Alfalfa it will be a fine thing, but buying it by the bag is too expensive.

Do not understand that the ration you mention is the very best that can be devised. Much depends on the price of different feed stuffs, and also on what one can get. I am at present feeding a very satisfactory ration, as follows: 125 pounds distillers' dried grains, 200 pounds oil meal and 200 pounds low-grade flour. This is scattered over corn silage. It would be rather sticky to feed alone, and in that case I would add 100 pounds of wheat bran, or else double the distillers' grains. This costs me $1.68 per hundred, and, quality considered, is about the cheapest ration I can buy. C. L. M.

Ration for Cows and Pigs.

1. Will you give me a paying ration for new milch and farrow cows (giving a small amount of very rich milk) from the following feeds: Bran $1.40 per 100 pounds; gluten $1.65; cottonseed $1.90; linseed $1.80; ground oats $2; cornmeal $1.65. I would rather not use cornmeal. Have for roughage early cut mixed hay, no roots or silage. I sell butter fat. 2. What is the best ration for 10-weeks-old pigs to be dressed in March? I have very little skim-milk. O. A. R.

Maine.

1. Two pounds each of bran, cottonseed meal and oil meal will be a good ration for a cow giving 18 to 25 pounds of milk daily. In the case of cows giving very rich milk it may be advisable to give a trifle more grain in proportion to the amount of milk. It will be better to feed grain two or three times daily, rather than all at one feeding. 2. A good grain ration for the pigs at present would be four parts, by weight of white or flour middlings, three parts cornmeal and one part oil meal. The cornmeal may be increased to two-thirds of the whole ration for a few weeks before butchering. C. L. M.

Radishes for Cattle.

I would like to know the feeding value of radishes for cattle. I think some of the Summer varieties will outyield mangels on the same ground with less care. I have been feeding them to milch cows, and they seem very fond of them.

Ohio. H. S. J.

By analysis the radish would be worth about two-thirds as much as mangels or carrots. We have no record of the yield of radish as a field crop. We do not think radishes would keep as well as the other roots, though they might pay for early Summer feeding where cattle are kept up.

EARLVILLE NEW YORK

ATLAS

When a lot of neighbors want a good road, they all get together, and each pays part of the cost in taxes, or some way.

It would be good sense to carry that farther. With a fair sized concrete mixer for instance, a silo, barn foundations and floors, ice-houses and troughs, or any small work can be built about as cheaply of concrete as of wood.

Why don't you men in one township or district get together and buy one, each pay part of the cost, and take turns using and helping to use it? In a few years you'd have the model township of the State for good durable buildings.

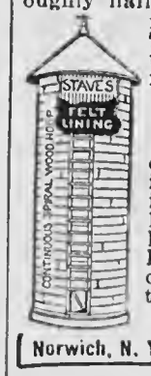
Silver Manufacturing Co., Salem, Ohio

CRAINE SILO

IT CAN'T COLLAPSE

The Craine Patent Triple Wall Silo has thick vertical wooden staves, inside; horizontal patent wooden covering thoroughly nailed, outside; and water-proof felt-like rubber roofing between. This makes a perfect non-conductor of heat. SCIENTIFIC in every feature of its construction.



IT'S FROST-PROOF
AIR-TIGHT PERMANENT

No silage spoiled by contact with concrete, tile or any mineral. Craine silage is sweet, clean and perfectly preserved—it is "drawn from the wood." No troublesome iron hoops requiring annual overhauling. The first cost is low and is the last. The Craine is, therefore, the cheapest on the market. Ask for illustrated booklet.

AILING ANIMALS.

Urticaria in Pigs.

I had five May pigs. When about five months old they became sick, refused to eat. Pigs were fed whey, hominy meal and white middlings, with some corn in the ear. When first taken the pigs lay around and when roused would stagger about and soon lie down again. Finally their ears turned purple, also purple rash on hams and bellies. Later red blotches covered with deep seated scabs appeared on backs and sides. One pig finally died. The others seemed better and began to eat. In about three weeks they again began to stagger and fall, and were covered with red scabs and the purple rash appeared on two of them. Is there any cure for them and what was the matter? F. S. B.

Bethel, N. Y.

The disease is urticaria, also called nettlerash or surfeit, or "diamond disease," the spots on the skin having that shape. It is due to indigestion, from sudden changes of feed, or indigestible feed, or too much feed and too little exercise. It is somewhat akin to "hives" of children. One has to find and remove the cause, increase exercise, decrease feed and physic the affected animals with epsom salts in slops or water. In bad cases feed milk and middlings, made into a light slop, to which add limewater at the rate of one ounce to the quart of slop. Bathe affected parts of skin with a 1-100 solution of coal tar dip, as often as found necessary. Provide clean, dry beds. A. S. A.

Drying Off Cow.

I have a fine Jersey cow. I expect her to come in about February 10. I feed only hay, one quart of bran, and a small handful of oilmeal so that she drinks water. I milk her once a day, but she gives 2½ quarts of milk yet. I don't seem to be able to dry her up. Do you think this will harm her milk flow when she gets the calf? If I cannot dry her up, what feed and how much should I give her, so that I do not have to fear milk fever? This will be her fourth calf.

Tallmans, N. Y. C. R.

Turn the cow out for abundant exercise every day and stop feeding grain. Feed hay, straw and roots. Leave a little milk instead of milking her clean and after milking rub in a mixture of equal parts of camphorated oil and fluid extract of belladonna leaves. If the udder stays sound milk each other day, after a few days, and then every three days. Great care will have to be taken to milk out clean if the udder shows any sign of inflammation, and at such times bathe three times a day with hot water and then rub in the lotion just prescribed. Milk fever will not attack the cow if you make her take plenty of exercise, and do not feed her heavily, but after the milk flow ceases it would be well to feed bran to regulate the bowels and to add flaxseed meal toward calving time. If roots are fed it will be less necessary to feed bran. A. S. A.

Indigestion.

My horse weighs 1,150 pounds and does not do any hard work but a drive three miles to town every few days. He does not have as much life as I think he ought to, and does not keep fat. He is eight years old; he has some trouble with kidneys. Can you give me a ration and cure for him? C. W. C.

The horse is overfed and under-exercised. When there is no work for him to do either enforce ample exercise every day or turn him out. During idleness stop feeding grain and let him live on mixed hay, carrots and bright fodder. On work days feed not over one pound of whole oats per hundred pounds of body weight as a day's ration, and a like amount of hay. If the work is hard add one quarter pound of wheat bran, by weight, to the oats per hundred pounds of body weight, but do not increase the hay. The amount of hay may be increased in times of idleness. Add a few ears of corn at noon on cold days, in place of oats and bran. Have his teeth attended to by a veterinarian and if the hair of the body is long and coarse clip it from the belly and from the legs above knees and hocks. Allow free access to rock salt. Give the drinking water before feeding. Medicine should not prove necessary. The urine will clear up when you feed and exercise the horse properly. A. S. A.

Garget.

I have a heifer that is due to freshen in February. There is something wrong with the right side of her udder; it is caked and the front teat on that side gives yellow thick milk which has a bad smell. What can I do for her? What causes it? H. C. A.

New York.

Bruising may cause such a condition, but in your heifers it is more likely to have come from sucking of the udder by other calves. That bad habit should be prevented at once when noticed. It leads to much trouble when cows come in milk for the first time. Strip out the fluid three times a day and then rub with camphorated oil; but we fear that the quarter is permanently ruined. A. S. A.

Get Your Canadian Home From the Canadian Pacific

HENS vs. COWS.

I give herewith a report of the contest between hens and cows as conducted at Maple Dale Farm for the year 1913 just closed. The cut is from a photograph of my farm buildings where the work was done. I keep 10 to 12 cows and 8 to 10 units of hens, raising my own young stock and buying all grain feed in both cases. I started the year with 1,800 hens. From the cows I have sold during the year less than $2,000 worth of milk, beef and veal; to be exact $1,867.29. From the hens have sold during the same period $4,500 worth of market eggs and poultry, besides increasing my stock by 800 birds, easily worth $500 more, making $5,000 in all from the hens. The feed bills were less than half of the total sales in both cases but the cows have also consumed a barnful of hay.

The cows make far more work than the hens. I hire one steady man. He milks and cares for the cows.

I care for the hens. The hens milk themselves. His day's work begins at 5 a. m. Mine often begins at 7.30. The net returns from the hens are greater than the gross sales from the cows. This in effect is equivalent to relieving the milk producer from the payment of all feed bills, besides giving him his hay

VIEW OF THE MAPES HEN AND COW BARNS.

crop to sell for cash, and no more labor involved. Put it another way. It is in effect equivalent to a new breed of cows not only giving twice as much milk as present breeds, but also giving it in sealed bottles all ready to be gathered up once a day.

Long live the business hen.

O. W. MAPES.

A SENSIBLE COLORADO DAIRYMAN.

We farmers must take our choice of the three kinds of farm papers published for our benefit. They are issued for the advantage of the advertiser, for the editor and printer, or possibly for the man who pays for it. The first kind does not cost much, and its value is equally as great; the second costs too much and tests about equal to some of the fancy stuff advertised in it. Once in a while we find one of the third kind, but are not apt to recognize it at first, because it is rather modest and conservative, but we find we kind of like to get together. The real test is the fact that we get mad if it does not come on time. One of this latter kind finds its way out to my little farm near Denver, where it is eagerly waited for. Each issue lately has had some fine articles by practical men on the subject of purebred dairy stock. And right here I want to say that the great charm of THE R. N.-Y. is the fact that I never have to read what some department editor has to say, but I always get the facts from a number of men who talk from experience.

A man who starts farming from choice, and even after a number of years, sticks to it from choice when offered other chances, usually looks forward to the time when he can own and breed some registered stock. Mind, I am not talking of the "farmer" who commences with prize winners and a "superintendent" and who very often fails to notice a really good animal until he happens to be told what it cost. These wealthy men often do a great deal for a breed by getting together a certain "family" and keeping it to a high standard, but unfortunately they also keep the price to such a high plane as to put really fine animals entirely beyond the small breeder, and there is one feature where the small breeder excels. He must cull more closely, because he has not the room or the help for any but a very gradual growth.

I have become rather in favor of the Guernsey, believing that the average Guernsey cow is a more profitable animal than the average Jersey, and that a certain sum invested in a Guernsey will buy a higher class animal than will the same amount spent for a Jersey. The Jerseys, owing to their beautiful appearance and the wonderful production of some cows, have been the victims of the "predatory rich," who have put a fancy value on some families. The average grade cow is increasing in dairy value faster than the average registered animal. The chief advantage of purebred stock is, I think, the good effect they have on us. We give them better quarters and care, we weigh and test their milk, and take a greater interest in their performance, and they return our care full value with interest. It amounts to the difference between going into business with some chance acquaintance who asks for a job and of forming a partnership with some friend who is an expert in his line. Of the first, we judge only by appearance, and know nothing of his "folks," or what to expect from him. Of the second we have some proof, and we generally know the stock he comes from. In fact, working with grades is a gamble, while working with "blood" is a game.

J. B. PLATO.

Colorado.

WHY I BREED BERKSHIRES.

The Berkshire is the handsomest type of swine ever developed. They appeal to the idealist more than to the everyday practical farmer. A "hog is a hog" to him, regardless of his makeup. To one who is seeking the most beautiful, a hog that appeals to him is a Berkshire. In most cases it is not too much to say that before a man can appreciate a high-class Berkshire he must have a critical eye, a keen sense of beauty of form and lots of interest in the values of life, for a Berkshire, at his best, stands apart from the typical, mere hog. Some claim they are not big enough; others that they are "rich man's, or gentleman's hog." No breed is better adapted to all parts of the country, especially the East. They are good rustlers and rangers, will turn almost any kind of feed into pork, and cut the highest percentage of the best kind of pork; one of the best breeds for export. They are unexcelled as mothers and very prolific.

M. H. TAYLOR.

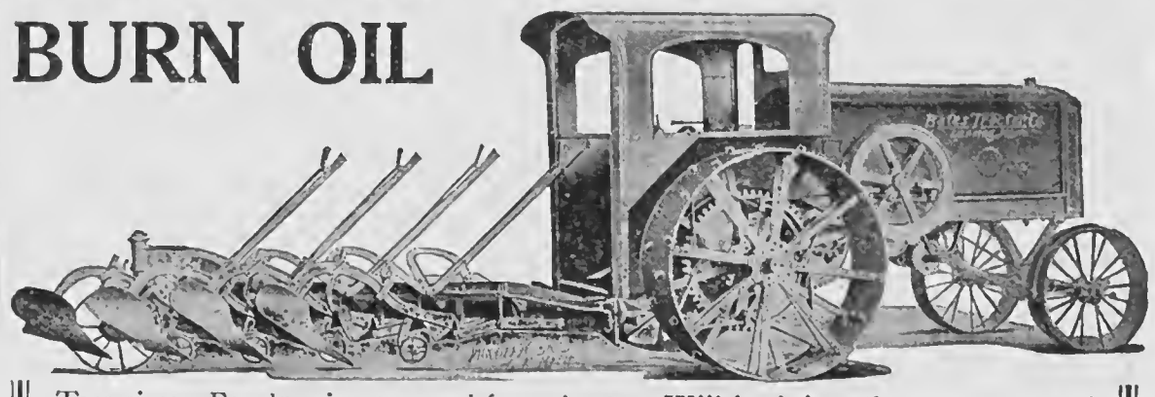
Pensylvania.

LIVE STOCK NOTES.

THE Kansas Horse Breeders, by resolutions, declared that the stallion owner should be given more protection by law. He should hold a lien on the mare and offspring for 18 months from the time the mare is bred, they decided. It was suggested that there should be a $20 to $50 fine for anyone who should sell, or remove from the State, such mare or colt without the consent of the stallion owner. They also expressed themselves as being in favor of more colt shows. They decided to boost this work through farmers' institutions and fairs.

THE American Guernsey Cattle Club has endeavored to surround the breeders of Guernsey with all the safeguards possible, so that they may ever have at hand means of identification of their animals. The form of certificate which the club is now using shows not only the registration data on the one side, but on the reverse side gives a copy of the sketch of the animal as it was filed with the club at the time of registration. This insures every purchaser of Guernseys an opportunity to check up his purchase with the original description filed, and is a great help to breeders in keeping a careful record of their herds. During the first week in 1914 there were entered in the Herd Register 101 bulls and 206 cows, a total of 307; 243 transfers have also been recorded.

BATES ALL STEEL TRACTORS
BURN OIL



Two sizes—For drawing two and four plows. Will back into the very corners of the fence, and plow the entire field without the aid of horses. Can be operated by **one man.** Will **burn kerosene** equally as well as gasoline. They are light in weight and can be driven over soft ground in the Spring of the year. Will plow up steep hills and do good work in stony fields. We guarantee these machines to do good work on your farm before asking one cent of your money. You are taking no chances; neither are we. Send for catalog.

PIGS and calves thrive and grow fat when fed with warm, skim milk. You cannot get warm skim milk to feed them unless there is a cream separator on your farm. There is money enough in this one advantage to pay for a cream separator the first year. This is specially true if you buy a close skimming, durable International Harvester cream separator—Lily, Bluebell or Dairymaid.

These separators have all the points which make cream separators good. They have the balanced bowl, the self-adjusting neck bearing, the tool steel spindles, the bronze bushings, the spiral gears, the low supply can, the high skim milk spout, and the open, sanitary base, without which no separator can be satisfactory.

Some dealer near you handles I H C separators. If you do not know, write us and we will tell you who he is. We will also send you our cream separator book which tells you why it pays so well to buy an I H C separator.

NEW YORK STATE NEWS.

THE LEGISLATURE.—The Legislature reconvened for business on January 19, and before it adjourned for the day had introduced 40 bills. None of these was an agricultural measure so far as we know. Two or three were for the investigation of highway graft, and several were to amend the highway law. Governor Glynn sent a special message to the Legislature calling for a revision of the law relating to the control of the short loan business as operated by the loan sharks. The nomination of Dr. Herman M. Biggs to be State Commissioner of Health was confirmed by the Senate at once. Speaker Sweet announced his committees. The Republicans got about 250 places, the Democrats 135 and the Progressives 37. The chairmanship of the five most important committees went to Barnes men. The Senate committees hold over from last session.

PUBLIC SERVICE COMMISSION.—The annual report of both public service commissions were presented to the Legislature. Several amendments to the law are desired and $2,000,000 are asked for eliminating grade crossings. It appears that during the year 369 grade crossing accidents occurred outside Greater New York, in which 113 were killed and 311 injured. During the year 25 grade crossings have been eliminated. The total number removed to date is 312. Routes of auto bus lines, the automatic signal system on railroads, gas meters, the telephone service and many other minor matters had the attention of the commission. The expenses of the commission for the year were $373,068.21.

ANOTHER COMMISSION PROPOSED.—In his report to the State Agricultural Society meeting, ex-Assemblyman C. Fred Boshart of Lewis county, recommended the establishment of a non-partisan State milk price commission which should have power to fix prices. He would have that commission composed of the Commissioner of Agriculture, a representative of the State Grange, a representative of the New York city milk dealers and one from the New York City Board of Health. Mr. Boshart commended the work done by Commissioner Huson and had a good word for the new farm bureau movement. He opposed the Adamson bill now before Congress, which forbids the killing of heifers under seven years of age, and the Hamilton bill prohibiting the killing of calves under six weeks of age, as the State has fixed the age limit at four weeks.

GRAIN AND HAY BROKERS.—In a recent opinion handed down by Attorney-General Carmody it is held that grain and hay dealers must take out a license as commission merchants and give bond the same as provided for other commission men. The Attorney-General, however, adds that if these commodities are simply consigned to them and they do not take physical possession of them then they are not required to have a license.

FARM CREDIT BILL.—It looks as if Governor Glynn's farm credit bill as proposed or outlined at this writing would meet with Republican opposition in the Legislature. At least it will not have clear sailing. Speaker Sweet is credited with the statement, in an interview, that he sees no reason for the State's passing such a measure since the matter is now under consideration by Congress. There may be something in this and we hope that is the real reason for the Speaker's opposition, if it comes to that, rather than a desire to prevent Governor Glynn from taking the credit for such legislation if such legislation there be.

GRANGE ANNIVERSARY.—Clyde Grange has recently celebrated its fortieth anniversary. There were 400 members and their friends present on the occasion. This grange was organized in 1874 and Benjamin Weed was its first master. This Grange has one of the largest libraries of any Grange in the State, numbering 2,000 volumes. Out of this Grange has sprung the Fire Relief Association of Wayne county and the Farmers' Exchange, both prosperous institutions.

ONEIDA FARMERS TO COOPERATE.—A movement is under way to form a coöperative society among the farmers of Oneida county and incorporate under the new State law. Over 100 prominent farmers attended the meeting when the question was discussed and all were in favor of the idea. Marc W. Cole, superintendent of coöperation of New York State and M. C. Burritt, State leader of the farm bureau movement, were present to explain things and aid the farmers in coming to a decision in the matter. A committee was appointed to formulate plans and report to a later meeting.

NEW AGRICULTURAL SCHOOL.—The new agricultural building of the Worcester, N. Y., high school has been recently completed. There are 18 members of the agricultural class in the school in whom the people of the town and vicinity are taking a great interest. Prizes are offered by some of the leading farmers to the students for excellency in various lines of work. Worcester has a flourishing Grange with a membership of 285 and they have engaged the past year quite extensively in coöperative buying of farm supplies. Among the items were 253 tons of fertilizer costing $47,171.46; 849 tons of feed and 301 barrels of flour, $25,197.56; grass seed, seed corn and peas, $1,998.75; groceries, $4,874.73. Total, $36,688.50.

DAIRYMEN'S LEAGUE.—The Dairymen's League is extending itself over the State quite rapidly. Recent branches organized are at Delhi, Delaware county and at Canajoharie. The Dairymen's League, which is organized in five States, has enrolled farmers representing 175,000 cows. The purpose of the league is to have farmers fix the price for their milk instead of having middlemen do it for them.

SAN JOSE SCALE AGAIN.—The Genesee county fruit growers are much agitated over the reappearance of the San Jose scale, which fairly burned its way across the country a few years ago. The county fruit growers' association has had a meeting to devise means to check the plague. The 70 members of the association own about 700 acres of fruit trees and they are going to make a strong fight against the spread of the pest.

WINTER SCHOOLS OF AGRICULTURE.—An extension school of agriculture began a week's session at Holley high school on January 19, and there will be one instituted at Kinderhook January 26. The school at the latter place was so well attended last year that the local managers and the State Agricultural College will make this one something of a model in its way. Among the instructors are Jared Van Wagenen, Jr., A. C. King, A. E. Wilkinson, L. J. Cross and others. There will be courses in domestic economy also. The school is in session from 9 to 4 each day and the tuition is $1.25 for the week.

THE BOND SALE.—When Comptroller Sohmer opened the bids for $51,000,000 State 4½ per cent. non-taxable gold bonds, he found the issue several times oversubscribed. Of these bonds, $30,000,000 are for canal and $21,000,000 for highway purposes. More than 200 sealed proposals were received at the Comptroller's office up to the night prior to the opening of the bids. The number received exceeded that of any other bond sale of the State.

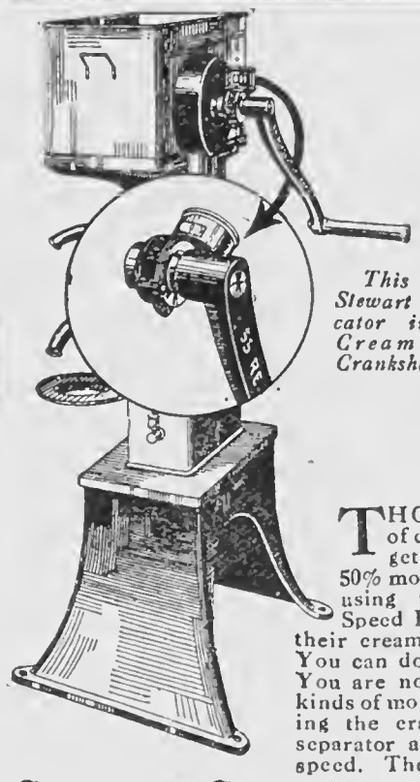
HEALTH COMMISSIONER'S REPORT.—From the report of Health Commissioner Porter it appears that the death rate for the past year is about the same as for 1912, it being for the latter year 14.8 and for 1913, 14.9 per thousand of population. The city death rate for the past five years has been 15.8, and the rural rate 15.6. A total of 145,056 deaths were reported last year, of which tuberculosis claimed 13,800, and Bright's disease 10,431. Pneumonia was third, with 9,431. A total of 228,460 births were recorded. There was only one death from smallpox.

The snowstorm which occurred January 12 was the coldest and most severe of any this season. The mercury lowered to 8 deg. in some places, while at others it went down to 20 below. The snow blocked the roads so that the rural mail did not come for two days. Cattle are still very high; milch cows or those that will be fresh this Spring, if they have enough Holstein blood to give them the color, bring $75 per head. Heavy work teams $500 a pair. A great many are improving their opportunity to haul logs and wood. Eggs 34; chickens, live, 12; butter 30. There is no call for hay at present.

S.

Mayville, N. Y.

Increase Your Cream Separator Profits!



This shows the Stewart Speed Indicator installed on Cream Separator Crankshaft.

THOUSANDS of dairymen are getting 10% to 50% more cream by using the Stewart Speed Indicator on their cream separators. You can do the same. You are now losing all kinds of money by turning the crank of your separator at the wrong speed. The

Stewart Speed Indicator for Cream Separators

is an instrument that goes on the crankshaft of your separator. Its dial tells you when you are operating your separator exactly correct so as to get every bit of cream out of your milk.

Nobody can turn any separator at the right speed *without* the Stewart Speed Indicator. One dairyman with 20 cows lost $524.10 in a year just because he guessed at the speed. Another, owning 8 cows lost $18.50 *in one month* by guessing.

Fits any Separator—$10 Complete

No matter what make your cream separator is, the Stewart Speed Indicator will fit it—and the price is only $10 complete.

You can order one from any hardware dealer, or cream separator dealer, or, send to us direct.

Information and Butter Books—FREE

Fill out the coupon below and mail it to us. It will bring you this book that tells you how to get the cream profit that you are now losing every day.

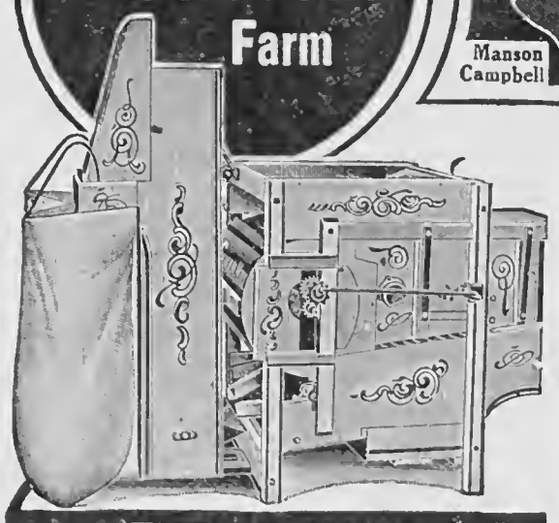
$1.00 Puts It On Your Farm



THE CHATHAM Grain Grader and Cleaner

Handles 70 Kinds of Seed Grain and Grass Seed

From Wheat, it takes Wild Oats, Tame Oats, Cockle, Rye and Smut.
Cleans the dirtiest Flax. Has special knocker and skimmer which prevents clogging. (Other machines choke up.)
Takes Dodder, Barn Yard Grass and Foxtail out of Alfalfa and Millet "slick as a whistle."
Takes Buckhorn from Clover.
Sorts Corn for Drop Planter.
Famous BEAN MILL. Handles all varieties, takes out the SPLITS, Clay, Straw, etc.
Handles Peas as well as any Grain or Grass Seed. Removes foul weed seed and all shrunken, cracked and sickly grains. Takes out all dirt, dust and chaff. It is also a bully chaffer. Handles 60 bushels per hour. Gas power or hand power. Easiest running mill.

Manson Campbell

For $1.00, I Clean and Grade Your Seed Grain

You can't afford to plant common Seed and take chances on a poor crop, when I am offering to scientifically clean and grade every bushel of your Seed Grain for this spring's planting for **one paltry dollar.**

Here's my proposition, and if you are a smart man you will write me before sunrise tomorrow:

Send me one dollar and I will ship you, FREIGHT PAID by MYSELF, this improved 1914 Chatham Grain Grader and Cleaner, with all equipment. Clean your Seed Wheat, Oats, Flax, Barley, Peas, Beans, Corn, Grass Seed, etc. Then PLANT those fine seed. AFTER you have harvested a bumper crop, pay me the balance of my low price. Not one penny need you pay, except the $1, until next October. And by October YOUR CHATHAM WILL HAVE MORE THAN PAID ITS ENTIRE COST IN INCREASED CROPS. Then you'll have it to work FREE for you the rest of your life.

Your Dollar Returned

I only want the dollar as evidence of good faith—to protect myself from mischievous boys. If after 30 days' hard test, you don't want my "Chatham," send it back at my expense and I will return the dollar.

A "Made-to-Order" Machine

Every "Chatham" is practically a *made-to-order* machine, for I send you the exact and proper Screens, Riddles, Hurdles and Sieves to grade and clean every *Grain and Grass Seed grown in your locality.* That's the secret of my success. I would not be the leading maker of Graders and Cleaners if I had tried to make my equipment fit ten million farms. What would you think of a clothing maker whose suits were all one size? Wouldn't it be a *miracle* if he gave you a fit. Yet all makers of Graders and Cleaners, except me, send the same equipment, whether you live in Maine, Ohio or Oregon. They wouldn't do that, if they had my 41 years' experience,

Extra Screens Free

I use, all together, 81 Screens and Sieves. It usually requires 15 to 17 for the average farm. These I select from the 81. After 41 years in the business, I am pretty sure to pick the exact equipment needed on your farm. If I shouldn't, just drop me a line and I'll send your additional requirements. There will be no charge for this,

Samples Graded Free

Maybe you have some Seed Grain that you can't clean or grade or separate. Send me a sample. I will purify it and tell you how you can do it cheaply. No charge for this.

Seed Corn Sorted

My big Corn Sorting Attachment, invented 2 years ago, is a great success. Twelve thousand farmers and many leading Agricultural Colleges are using it. It is the only machine I know of which scientifically sorts seed corn for drop planters.

New Book Ready

Send me no money now—just a Postal, for the finest, most complete Book on Seed Selection I've ever written. After the Book comes, write me what size machine you want and I'll ship it, freight prepaid, on receipt of $1.00. Then clean and grade all your Seed Grain. If you write today, you get my Book by **return mail.** Address nearest office.

The Henyard.

Crops for Poultry.

I have two acres of land in New Jersey which I intend to use in the following manner to make a living: One-quarter acre I intend to work intensively as a vegetable garden. One quarter I have put in berries, currants and grapes. The remainder I intend to use for poultry, fruit trees, and green food or grain for chickens. Will you tell me what chicken food it would be most profitable to raise on the acre and a half? I intend to have S. C. White Leghorns, and use the open-front poultry house as advised by the agricultural stations. I have worked this land for a year, and it is very fertile, and in good condition; last Summer I had as large a variety of vegetables as they had on Hope Farm.
Brooklyn, N. Y. W. A. M.

Corn, buckwheat, rape and mangels are probably the best crops for such a plan. All will respond well to the use of hen manure. The corn, after it gets a foot or more high, will make good shade or protection for the hens and chicks. Sow clover and rye at the last cultivation of the corn for a cover crop. This will make good pasture both Fall and Spring. You can sow oats or barley in Spring. This grows grain and straw for litter, and after harvest the grain stubble can be seeded to buckwheat and clover, the buckwheat for grain and the clover to remain. The mangels are always useful for feeding poultry. A piece of rape will give fine pasture.

A Hen Record.

In December, 1912, I had a pen of 29 pullets. I enclose the record of eggs laid by them during the year ending November, 1913. Dec., 260 eggs; 1913, Jan., 450 eggs; Feb., 569 eggs; March, 603, five hens now setting; April, 419; May, 305; June, 332; July, 382; Aug., 341; Sept., 342; Oct., 130; Nov., 152; No. of eggs laid during the year 4,285.

These hens also hatched me 250 chicks 1913, I had lost three of my 29 pullets, leaving me 26 hens, have added 49 pullets to these, making me a flock of 75. During December they have laid 756 eggs. To me it seems a big record for an ordinary farm flock of S. C. R. I. Reds, where there is no specialty made of poultry in egg-raising except to keep them as near purebred as possible.
Orange Co., N. Y. P. K. L.

Charcoal for Chickens.

How can I make charcoal for chickens, and what kind of wood do I need for it?
Old Bridge, N. Y. J. Z.

Willow is best but any wood will answer. Many stockmen use corncobs with success. Dig a hole in the ground, pack the cobs in firmly with a small quantity of light kindling. Cover the top over with soil so as to prevent a draft and set on fire. After the fire is well started, cover all openings so as to admit just enough air to enable the pile to smoulder without blazing.

Defects in Type.

Is it a natural defect in S. C. White Orpingtons to have yellow feet and legs, or is it caused by ill-mating? What is the cause of the pullets having grey feathers occasionally? Would it be advisable to breed hens to a cock with black feathers in his tail? Would you advise one to keep such stock and by careful selection in mating try to overcome the difficulties, or would you make a change in the breeding stock used? M. S. S.
Draper, Va.

The plumage of the White Orpingtons should be pure white throughout, and the feet of a white or pinkish white color. Like all "made breeds" they will occasionally show reversions to the markings of some one of their ancestors, these having not been entirely bred out. You will have to get rid of such defects by discarding from your breeding pens the fowls showing them, or, in other words, selecting for purity of type. This is a long, slow, process, but the only one by which a new breed can finally be made to always come true to type.

A Case of "Limberneck."

On page 1280 J. W. N. asks for remedy for limberneck. The only remedy is the ax after the fowls have taken it. Prevention is what you want; it is simply burn every fowl that dies, which only requires a few minutes and a little wood or oil in an old pot. Limberneck I find is caused by a maggot that gets into the carcass of a fowl that is left lying around. The other poultry eat these and they stick in their throats and windpipe and begin eating and of course soon eat through, and the fowl dies. Last Summer I found a hen dead, and began to look for the cause. By the time I discovered the hen that the maggots were on I had found half a dozen choice fowls dead or dying. Again, never bury a dead fowl, for these maggots will work up through the ground and before you know it you have one or more limberneck fowls. I saw this happen to a hen with a large brood; in 24 hours after eating all were dead. J. O. G.
Virginia.

Dry Mash Formula.

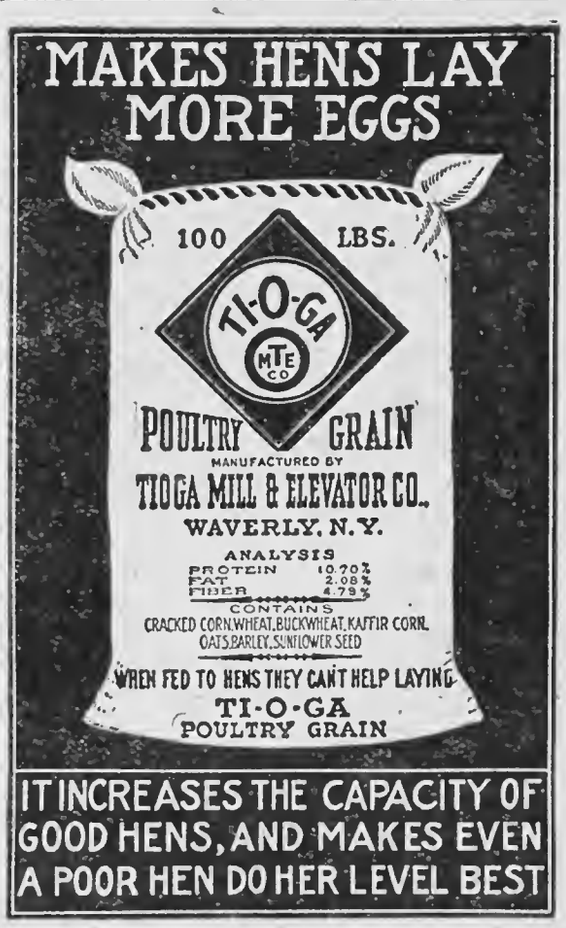
I have always fed wet mash, but wish to try hopper feeding dry mash. Which formula do you think is best to feed? The Maine mash is about one in eight of scraps, and the Cornell is one in five scraps. My hens are yearlings and two year olds, cross between W. Rock and Leghorn. My plan is to feed a light feed of grain in the litter in the morning, open dry mash at noon, open whole grain hopper two hours before dark. My whole grain is corn and wheat in Winter and wheat and oats in Summer, mixture equal parts by measure. The corn I grow, so it is whole corn. G. S.
Whitman, Mass.

Your proposed plan of feeding is good, and you will probably get good results with either the Maine or Cornell formula for a dry mash. Nothing but an extended test could determine which formula was best, and that would determine it only for the exact conditions under which the test was made. While I frequently recommend certain formulas for compounding dry mashes, this is done only to present a well-balanced combination of foods, and not because that particular formula is superior to all others. All domestic animals adapt themselves to a wide range in variety of foods, and it is not necessary, or even desirable, to limit them to any one definite combination. One who feeds domestic animals for profit should learn the general principles governing nutrition and feeding; he will then be able to make combinations with such feeds as are available to him, and to take advantage of the difference in market prices of these feeds. M. B. D.

Sulphured Oats.

A very large number of poultrymen would like to feed sprouted oats to their hens. Most of the oats obtainable now in the market will not sprout because the germ has been killed by the sulphur treatment. A grain dealer told me recently that not one carload in ten would sprout on account of that treatment. If the germs are dead are the oats first quality? Have they not been injured by the treatment? Would not a law forbidding such treatment be a good law? H. C. T.

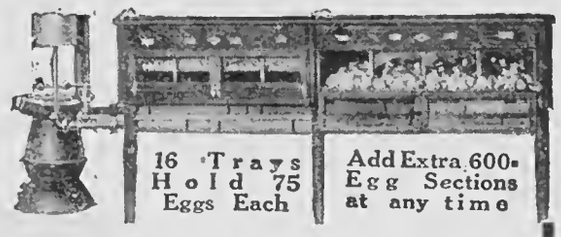
Last Spring we gave the facts about these sulphured oats. They are usually grain that has been discolored in some way. When treated with sulphur fumes the oats are whitened and given a better appearance. The germ is usually destroyed and of course such oats will not sprout. Some of them taste so strongly of sulphur that horses will not eat them unless very hungry. Grain dealers tell us that plenty of natural oats can be obtained. They cost two cents or more per bushel extra, but they will sprout. The sulphured oat as sold at present is a fake—inferior stuff brightened up to look like the read goods. There ought to be a law compelling grain dealers to sell sulphured oats as such—marked and branded to distinguish them from the natural, live grain. It is a clear case of fraud to sell "dead" oats to a poultryman when he wants the grain for sprouting.



There is Ready Money in Baby Chicks

You pay about two cents apiece for hatching eggs in season; you can sell Baby Chicks for 15c apiece. Install a

CANDEE INCUBATOR



This 1200-Egg **CANDEE** can earn $288 in 189 days hatching eggs for other people. You can make even more money selling Baby Chicks. A 6600-egg machine can earn $1056 in 126 days; $1584 in 189 days.

Hot Water Sectional - Automatic

—in any clean cellar or basement and you will have a modern farm machine that will produce money quick. This is a wonderful thing when you stop to think that nearly all the other products you use machines for, are not sold until Fall. By selling Baby Chicks and hatching eggs for other people, you get a cash income in Spring.

THE CANDEE INCUBATOR IS AS SAFE AS THE KITCHEN STOVE

It doesn't cost much, and you can set it up in a few hours. The coal costs but a few cents a day. There is an automatic regulator on the heater and each 300-egg section has a separate automatic thermostat regulator. This complete regulation and the hot water heat makes stronger, sturdier chicks. These features are found only in the **CANDEE INCUBATOR.**

THE EGG-LAYING CONTEST.

The ninth week, ending January 2, shows a further drop in egg production of 99 eggs, the week's output being 876, as against 975 last week, and 1,004 the week before last. But Barron's White Wyandottes are not "dropping off;" one of his pullets, after laying splendidly up to two weeks ago—seven eggs a week part of the time—has gone broody, and has not laid in two weeks. But the other nine laid 52 eggs this week, 22 eggs more than any other pen of any breed. Here is their record, 7, 6, 4, 6, 5, 5, 6, 7, 5.

What does he do to them? Does he hypnotize them, and then by will power strong enough to reach aeross the ocean, will them to lay? I admit this solution is a trifle fanciful, so I "give it up." A well-known Connecticut poultryman said to me a few days ago, "That man Barron could take Buff Cochins and win with them." I doubt that, for a flock of Buff Cochins I knew—big eight-pound beauties—used to lay a smaller egg than a 2½-pound Leghorn and not half as many.

White Wyandottes also capture second place for the week, the pen from Merrythought Farm lay 34. Two pens tie for third place, with score of 30 each. They are Dearborn & Sharpes' S. C. Reds, and Cecil Guernsey's White Leghorns. "Pen 42," the "sour-milk" pen from Storrs Agricultural Station, are next, with a record of 29; 14 pens did not lay an egg this week. Below is the record for some of the best pens:

WHITE ORPINGTONS.		
P. A. Demgar, New York....	6	28

The blue ribbon pen for the month of December was Tom Barron's White Wyandottes; this pen laid 213 eggs, and the best individual hen in this pen, and in the contest, has a score of 49 eggs in two months, or an average of 24½ eggs a month. If she continued at this rate for the year it would make her score 294. Francis F. Lincoln's White Leghorns laid 172 in December, winning the red ribbons, and Cecil Guernsey's White Leghorns won third place, with a score of 163.

The Connecticut State Poultry Association expects to have Mr. Barron deliver two or possibly three lectures on poultry keeping, at their three-day midsummer meeting at Storrs College next July. GEO. A. COSGROVE.

THE CALIFORNIA EGG-LAYING CONTEST.

The Napa Valley Poultry Association, which is conducting the Napa yearly egg laying contest at Napa, Cal., did not issue any official bulletin for the ninth month of the contest, giving as a reason that the hens had made such a poor showing they did not consider it wise to do so, or words to that effect, and had decided to issue a combined ninth and tenth month bulletin, which has just been received. Why it is thought necessary to issue bulletins when the showing is good and not when the reverse is the case, is not clear. My idea of these egg-laying contests is that the poor showings should be given out as well as the good ones, in order to be of any value to the public at large. The showing made by the 66 pens for the ninth and tenth months gives a very good reason for the unusually high price of eggs. When fowls as carefully cared for as these are fail to lay a single egg in a month (as 10 of these pens did) all the boycotting of all the housewives' leagues in America, will not make the hen do any better.

Although we are well into the Winter, the writer has hens so far along in the molt at the present writing, that they feel more like porcupines when handled than fowls, nothing but quills on their bodies, and they must suffer more or less from cold weather, and as a matter of course, do not lay eggs. This is the cause of the remarkably poor showing at the Napa contest. For example, the pen of White Leghorns or Blom & Son, which led the contest for months, only laid seven eggs the tenth month and nothing the ninth. Otten's White Leghorns, fourth in the contest, laid none the ninth, 10 the tenth month; Lubben's Barred Rocks, fifth in the contest, laid none the ninth, and none the tenth. Bunjes' White Leghorns laid three the ninth, five the tenth; Stice's Barred Rocks two the ninth, none the tenth. All these pens are among the first 10 in the contest.

Only two pens have laid over 700 in the 10 months, the writer's pen of Buff Wyandottes, with 796, and Bloms' White Leghorns, with 751, while 11 pens are below the 400 mark, which would emphasize the remark of Secretary Rutherford that "all Leghorns are not good layers." He might say the same of all breeds. The Buff Wyandotte pen entered by the writer still leads the contest with a total of 796; the nearest pen being Blom & Son's White Leghorns, with a total of 751.

It is a fact worth noting that of the first 10 high pens, five are American or English breeds, and these pens made their good showing mainly when eggs were high priced; for example the Buff Wyandottes made their best month's record, 121 eggs for the month, when eggs were selling at 55 and 60 cents retail.

Following are the 10 high pens to date, with their records for ninth and tenth month and totals:

1. Pearson, Buff Wyandottes, 9th month, 15; 10th month, 12; total, 796.
2. Blom & Son, White Leghorns, 9th month, 0; 10th month, 7; total, 751.
3. Rutherford, White Rocks, 9th month, 15; 10th month, 21; total, 699.
4. Otten, White Leghorns, 9th month, 0; 10th month, 10; total, 683.
5. Lubben, Barred Rocks, 9th month, 0; 10th month, 0; total, 654.
6. Slocum, White Leghorns, 9th month, 10; 10th month, 22; total, 654.
7. Clardy, Buff Orpingtons, 9th month, 6; 10th month, 7; total, 600.
8. Stice, Buff Leghorns, 9th month, 16; 10th month, 0; total, 577.
9. Bunjes, White Leghorns, 9th month, 3; 10th month, 5; total, 558.
10. Stice, Barred Rocks, 9th month, 2; 10th month, 0; total, 549.

PUBLISHER'S DESK

Friends of this Department will be interested to know that during the year 1913, 743 claims were collected through this department, aggregating $10,112.91. During 1912, 558 claims were collected aggregating $10,926.51; during 1911, 539 claims aggregating $12,110.63; during 1910, 400 claims aggregating $9,065.45. For the four years there was a total of 2,240 claims, amounting to $42,215.50. During 1913, 2,061 inquiries were answered through this department for ratings on business houses and other purely business matters. Inquiries should be, and often are, accompanied by postage for reply, but the service is entirely free to subscribers, and we are glad to have them make use of it whenever the service will be of benefit to them.

Several years ago we called attention to the nature of the business done by the Monaton Realty Investing Company of New York City, and other concerns of the same kind. These realty concerns speculate in city and suburban real estate. One or more mortgages are placed on the property; and then bonds are sold on the basis of the estimated value of the properties above the mortgage. The so-called bonds are mere promises of the company to pay. They also write an installment contract in which the company promises to pay six per cent interest and a part of the profits and also promise a return of the money. The Appellate Court has recently held that the companies have no authority to do this kind of a business; that it is in effect a banking business and could only be carried on legally by concerns organized under the banking laws. The attorney general has now announced that proceedings would be brought against these real estate companies to compel them to refrain from this class of business, which of course, would drive them out of business entirely. It is said that a receiver would be asked for the Monaton concern, and an application made to have its charter annulled.

These realty concerns have been a scandal to the State. Some of them have issued notes, called bonds, to the amount of twelve million dollars or more. These have been sold through advertising and house to house canvassers to inexperienced investors who were led to believe that "bonds" were liens on real estate and first-class security. During the last two years there have been several heavy failures, and the holders of the bonds have been heavy losers.

The business has also brought its scandal to the publishing business. Some high-class publications have carried the advertising and published editorials indorsing the business. This publicity has helped the companies sell the bonds, and has been responsible for the loss of many a hard-earned dollar.

We have referred to complaints of subscribers who sent orders and remittances to the Heffron Company of Syracuse, N. Y., for goods that were never delivered. The company is now in the hands of a receiver and the affairs of the concern are under investigation. As near as we can make it out there are over 1,200 such orders unfulfilled, aggregating on an estimate twelve to fifteen thousand dollars. Mortgage for $50,000 was placed on the property, and the proceeds do not seem to be satisfactorily accounted for in full. A Sterling Securities Company was organized, and apparently controlled by M. E. Heffron; and this company sold stock of the Heffron company. At this writing no one seems to know what became of the proceeds of these stock sales. It seems that the mortgage was given to D. H. Tolman. He is now in jail. Others may or may not accompany him later, but it is safe to say that the people who bought the stock have lost their money. We must teach our people to be more provident of their savings, and the State should also help protect them from investment swindles.

A few weeks back I answered a puzzle just to see what it was. Yesterday I received this answer I enclose. I think this is giving something for nothing. It sounds too good to be true, to me. What do you think about it? I. P.
Maryland.

The enclosure with the above letter was advice from a watch concern that he had won a $50 watch. Everybody answering one of these puzzle advertisements is sure to win a prize. All the person has to do to get this $50 watch is to send $3.48. This is an old fake. The puzzle is usually made easy so that everyone can solve it. The scheme is to make you think you are getting a prize for your cleverness. It is an appeal to one's vanity. Of course, in reality nothing is allowed for skill in solving the riddle. They have a watch that they want to sell for $3.48. If they advertise it as such, they would get few buyers. We ran down a similar proposition some years ago, and found the concern was sending out a watch that cost 49 cents each. It was sent by express and the receiver paid the express charges, and the concern got a rebate from the express companies. In a few months they cleared up $40,000. The complaints finally forced them out of business. Any scheme that offers something for nothing is a sure fake,

On September 22, 1913, I left at the store of Wyckoff & Dickinson in Gilboa one case (30 dozen) of eggs, which was noticed by both Mr. Wyckoff and Mr. Dickinson, to be taken to the National Express office at Grand Gorge, N. Y., for S. & W. Waldbaum, 175 Chambers street, New York. I have been shipping to Messrs. Waldbaum during the past Summer, and have received very prompt returns. Not hearing from them as promptly as usual, I wrote, asking if they received the case, to which they replied in the negative. I then sent to the express office at Grand Gorge and found they had no record of my shipping any eggs on that date, and I have no receipt. I am enclosing affidavit of the driver of the stage, saying he left the eggs at the express office or station, which is the same. I can get no further trace of the eggs. There seems no doubt the express company had the eggs. Eggs were quoted at the time 32 cents, stage charges and express 53 cents, leaving net $9.07. Can you do anything with this? D. W. S.
Gilboa, N. Y.

We are giving this history for the opportunity it affords to issue a word of caution. We have been unable to collect several claims lately because of similar circumstances. The shipment had been entrusted to some one else and no receipt procured. It is impossible to get an adjustment from an express or railway company unless the claim can be supported with the evidence to show that they handled it. When any of this evidence is lacking the transportation companies deny all responsibility. Even an affidavit, as in this case, had no weight with them, for their books showed no record of the shipment.

The following advertisers who have been refused space in THE R. N.-Y. are all found in a single issue of one of the most careful of the other farm papers:

Bradley Brothers, Makanda, Ill.
A. L. Rice, Adams, N. Y.
N. M. Ruthstein, Racine, Wis.
Ratekin's Seed House, Shenandoah, Ia.
J. J. Bell Seed Co., Deposit, N. Y.
H. W. Buckbee, Rockford, Il.
A. A. Berry Seed Co., Clarinda, Iowa.
Mills Seed House, Rose Hill, N. Y.
John Lewis Childs, Floral Park, N. Y.
The Temple Engine & Pump Co., Chicago, Ill.
Jesse Beery, Pleasant Hill, Ohio.
M. M. Johnson Company, Clay Center, Nebr.

The income from these advertisements in the paper referred to is in the neighborhood of $3,000 for a single issue and probably not less than $9,000 for the season. The cost of one insertion of these advertisements in THE R. N.-Y. would be about $500; and in refusing them space it sacrifices probably not less than $5,000 each season. No other paper that we know refuses all of them. Few if any other paper refuses any of them. This is, of course, by no means a full list of all the advertising we refuse. It is simply the number that we refused which appeared this month in a single issue of another farm paper. We are not referring to this to blow our own horn, nor to knock other publishers or any advertiser; but it is important that people who buy goods through the mail and send their money with the order should discriminate in their source of supplies. Our purpose first of all is the information and protection of our own subscribers, and after that to raise the standard and the efficiency of advertising—to make advertising dependable. In all human affairs the best efforts are faulty but as near as we can approach it we want it to be possible to send a remittance to an advertiser in this paper with as much safety as it could be handed over a counter, when the goods are in sight. J. J. D.

Dickelman "Cluster" METAL SHINGLES

Furnish a perfect roof at low cost. Made of 99.9% pure, open-hearth iron, properly galvanized for lasting service. Easily and quickly laid with hammer and nails. Special side and end-lock makes them absolutely water-proof. Investigate sure by writing today for catalog about

"The Roof of Quality"

Tells why we can sell all "Dex" quality products under 15 year guarantee. Gives reasons why "Dex" Roofing cannot rust, split, crack or blow off. Shows how to lay all kinds of metal roofing. Let us mail you this useful book FREE! Write for it today. A post card will do.

The Word "Dex" Stands for Highest Quality in corrugated, v-crimped, roll roofing, and many other Dickelman Metal Specialties. Write for catalog To-Day.

Solid Comfort Vehicles

GREATER values than we have ever before been able to offer are shown this year in our complete line of Solid Comfort Vehicles as illustrated and described on the vehicle pages of our General Catalog.

Our *Leader*, illustrated below, is the biggest selling buggy ever manufactured. More than 50,000 are in daily use. But we offer equal values in other buggies, surreys, runabouts and spring wagons. Every vehicle we sell is guaranteed to give perfect satisfaction always. Our enormous vehicle business enables us to furnish the fullest measure of quality, style and workmanship, at prices a great deal lower than others ask.

Our price for the splendid buggy illustrated below is **$61.90.** It has triple panel auto seat, genuine leather upholstering, highest type body construction, triple braced shafts, best wheels made, full wrought fifth wheel, real long distance self oiling axle. Shipped from a warehouse near you.

If you want to read the complete description of this and many other vehicle bargains, turn to the vehicle pages of our big General Catalog. Compare the quality and prices with others and remember the guarantee of satisfaction we give you.

If you haven't our big General Catalog, simply say "Vehicles—66R69" on a postal card and mail to

Sears, Roebuck and Co., Chicago

When you write advertisers mention The R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page. : : :

PRODUCTS, PRICES AND TRADE.

Beginning with February the Board of Health rule regarding pasteurization will be in effect. This requires that all milk except grade A or certified must be pasteurized before it can be sold in the city. Heretofore the sale of raw milk for cooking has been permitted. There has been considerable surplus in this market during the past week, a 10-cent reduction to the producer in the near future being probable. The following gross prices cover most of the current business: Grade B, $1.91; C, $1.71 to $1.81.

*

Butter had an additional decline of two to three cents during the past week, 30 to 31 cents being now the top for creamery. Trade is very dull and receipts are larger. A shipment of about 200 cases fresh creamery from Argentina is in port but has not yet been sampled. The market on lower grades of packing stock and worked-over butter is in better condition. The demand is fair and prices have been on a proportionately lower level for these grades. Retailers are naturally pleased with the lower prices on creamery, as it means a material increase in their sales. A certain proportion of consumers use butter freely, no matter what the price, but the great bulk of "common people," as the uplifters call us, have to figure closely when butter wholesales above 30 cents.

*

The egg market is lower, mainly because of very dull trade. Receipts at New York are not large, but reports from the Southwest, which ships large quantities here, are that production is increasing. Very few grade storage eggs are offered at present; holders not being ready to take the reduced prices offered. The nearby white eggs arriving now have too large proportion of small sizes to bring within three or four cents of the top price quoted, 35 to 38 cents being extreme for most business of this class.

*

Argentine beef is being sold in New York several cents per pound under our home product. Many retailers are evidently selling it as domestic, thus making an additional profit. To offset this some of the large independent wholesalers are now arranging to do a retail business, selling at the reduced price possible considering its lower initial cost.

*

Wool trade in Boston is quite active, with weekly sales of nearly 5,000,000 pounds. Manufacturers using dress goods stock and carpet wools are showing considerable interest. Current prices of fleece wools follow: Ohio and Michigan unwashed delaine, 20 to 22 cents; half-blood combing, 23 to 24; fine unwashed, 19 to 20; delaine washed, 26 to 27.

*

Arrivals of grain at New York last year were as follows: Wheat, 52,979,500 bushels; corn, 10,704,275; oats, 20,382,300; rye, 739,175; barley, 6,194,725; flour, 9,451,447 barrels; corn meal, 725,417 barrels. Exports were: Wheat, 49,019,674 bushels; corn, 5,853,799; oats, 4,352,191; rye, 723,910; barley, 5,516,017; flour, 4,549,838 barrels; corn meal, 207,649 barrels. Argentina having complied with the reciprocal tariff requirements, wheat from that country can now be admitted here free of duty.

*

Barges built on the thermos bottle principle are being used successfully for river and harbor transportation of fruit. A temperature of about 40 degrees is kept, this being cool enough to ensure preservation, yet causing no injury to fruit of delicate texture.

*

California's oil production for 1913 was 98,000,000 barrels, valued at $50,000,000.

*

A cargo of 3,650,000 feet of lumber left Oregon for Shanghai, China, January 18.

*

The first East Texas strawberries of the season were marketed at Texarkana January 16. This is a month earlier than usual.

*

Automobiles brought New Jersey $661,000 in licenses and fines last year. $21,285.31 being fines, an excess of nearly $6,000 over the previous year.

Farm Hands and Laborers Supplied Free
We have many men anxious to learn farm work.
C. K. Blatchly, United Charities Bldg., 105 E. 22d St., N.Y. City

The FARMERS' BUREAU an agency exclusively for agricultural help. Only first class farm help and positions solicited. References investigated. Scientific advice on farm problems. Dept. R, 150 Nassau St., N. Y. Phone, 5565 Beekman

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

FREE TREES FOR TRAVELING EXPENSES

MISSOURI NURSERY CO., Box 72, LOUISIANA, MO.

Mannsville, N. Y., Aug. 22, 1913.

Dear Sir:

Please find enclosed $11.98 to pay for Vacuum Cleaner. Will say for the same that I found it very satisfactory, better than had expected.

Very truly yours,
MRS. CLARA W. BAILEY.

Dundee, N. Y., Dec. 19, 1913.

Gentlemen: Your Excell Galvanized Roofing is very satisfactory, in fact the best I ever saw in this town, 28 gauge. F. A. WILLIAMS.

Chittenango, N. Y., July 7, 1913.

Gentlemen: The Unito Invincible Incubator I bought of you is a little dandy. JOS. W. HARRINGTON.

S. Hamilton, N.Y., June 6, 1913.

Dear Sirs: As I sent about a year ago and got ceiling of you and liked it very much, I wish you would send me by return mail a catalog of your ceiling and roofing, as I have got to buy both for the schoolhouse in this district.

C. D. CRANDALL.

Lebanon, N.H., March 24, 1913.

Gentlemen: The Unito Perfect Poultry Fencing is the greatest and best fence I ever saw. Have used wire several times and it is as good as new. The plow is also the best I ever saw.

Yours,
H. WOODWARD.

33 Big Factories Cut The Cost To Save You Money

You Can See the Goods Before You Pay— Try Them 30 Days Before You Pay—

I want to show you that you can buy a thousand different articles—all guaranteed—including Ready Roofing of all kinds—Metal Roofings—House Paints—Barn Paints—Buggies, Wagons, Harness—Fencing for every purpose—Furniture—Incubators—Pianos—Farm Implements—Gasoline Engines—Cream Separators—and many other items for which you would likely pay ***one-third or one-half more than we ask,*** for our fully guaranteed factory products which we sell on the unusual plan outlined. I will positively ship any article listed in the United Factories Catalog to any responsible person, anywhere in the U. S.

No Money Down — No Deposit — No C. O. D.

You don't have to even make a bank deposit. Nothing like this offer was ever made before. My plan makes it entirely safe for every buyer who wants to save money. All chance of dissatisfaction, all risk, all expense, if no sale, is with us. You cannot lose one cent. We don't handle thousands of little things, priced cheap, but which cost you in the long run more than you would have to pay at home for the same goods. But we can save you money, and give you the best of satisfaction, on the many lines we make, and we will let you see the articles you select before you pay—try them 30 days if you wish to do so. If you want to save money on a large number of items—***the saving of which amounts to a real benefit***—write today for our

VOL. LXXIII., No. 4241. NEW YORK, FEBRUARY 7, 1914. WEEKLY $1.00 PER YEAR.

Cornell University Library 26:14

WHERE THE EGG MACHINES ARE KEPT.

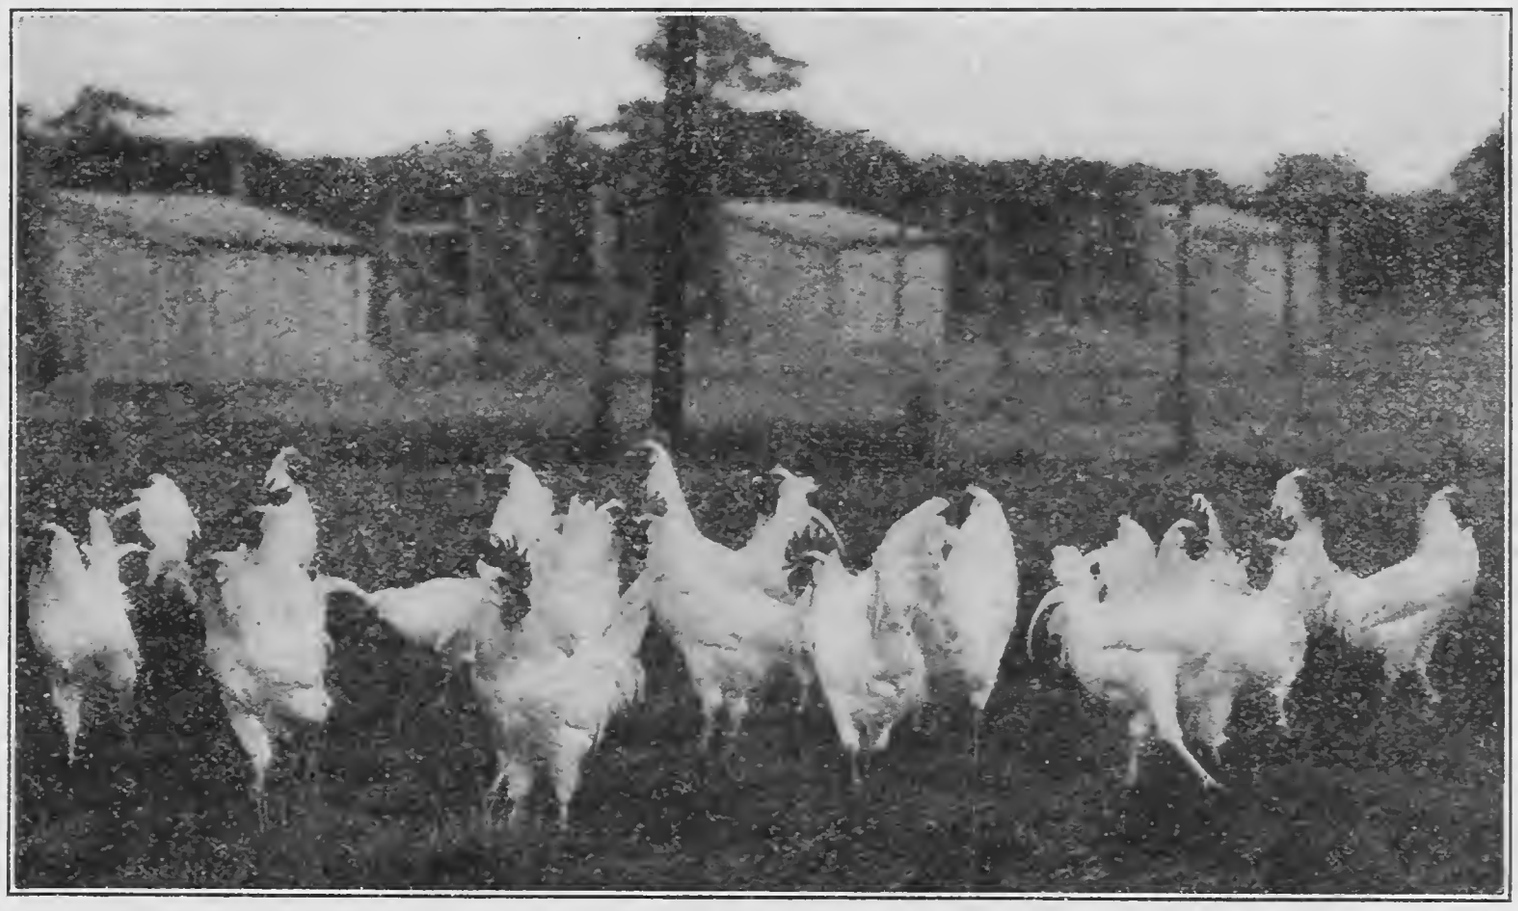
Barron's "Semi-Intensive" Poultry House.

This house is 72 feet long, 18 feet wide, and eight feet high to the eaves. It has a span-roof boarded underneath, and covered with corrugated iron on top. There are windows in the roof, which make it very light inside. There are also windows in the south wall which by ropes and pulleys and counter-balance weights, can be raised or lowered at will. This makes the south wall an open front the whole length. Under the windows 38 nests with a sloping top to keep hens from roosting on them are put. A storm screen three feet wide is put over the windows the whole length to keep out rain. This is very necessary in that part of England, where they expect it to rain at least four days in the week.

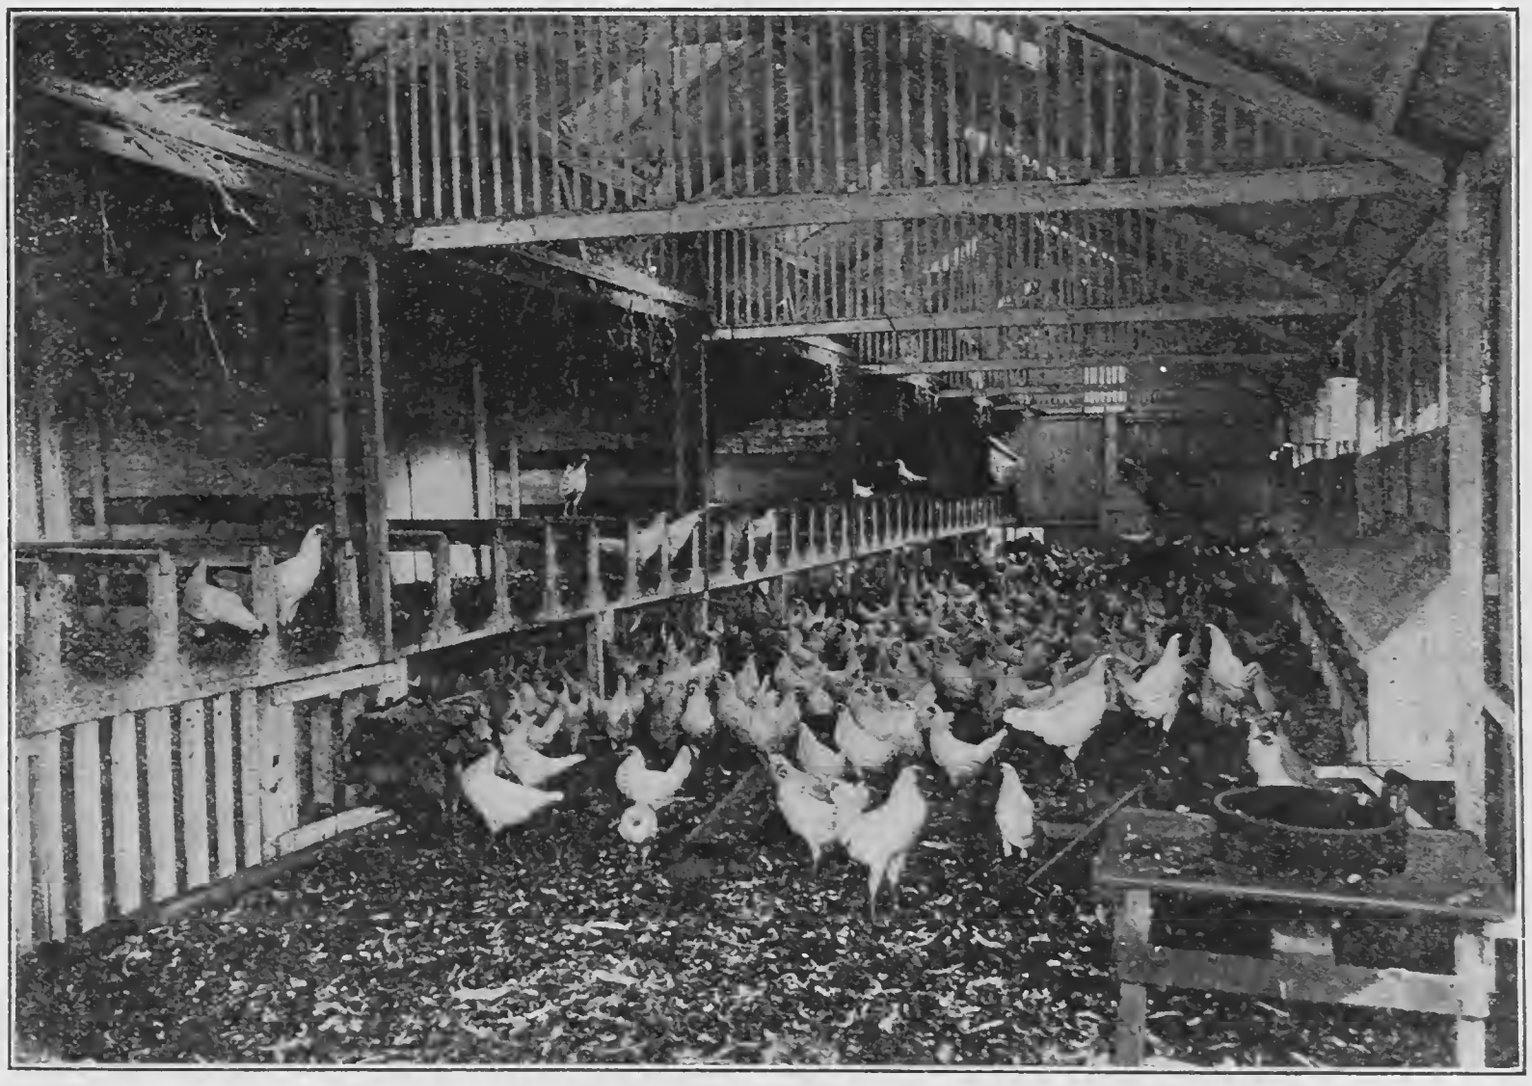
On the opposite side is the roost platform five feet wide, running the whole length of the building. It is 2½ feet from the floor. The 2x3-inch perches are put transversely, not lengthwise, and are 18 inches apart. Mr. Barron says that he finds the birds incline to crowd together, and get overheated on long perches, and then get chilled. Being split up as these are into 40 short perches, distributes the birds more, and the ample space between the perches keeps them from fighting; and being all on one level they settle down more quickly.

Every 12 feet this droppings board is divided up by partitions from the floor to the level of the eaves, where it is lathed over and straw is kept to absorb the moisture from the hens' breath, also to prevent side and down draughts of air in cold weather. There are 12 windows three feet by two feet in the roof, and 14 small windows under the droppings boards, these are 20 inches square, to make it light so that the birds can see to find the grain in the litter.

Water is contained in two large "piggins," mounted on platforms to keep the litter out. These are entirely emptied, scrubbed out, and refilled every day. The wet mash, given towards evening, is fed in troughs standing on the floor. Mangels, turnips and cabbage are put into specially made troughs, with a standing board on each side a few inches above the floor. They have shells and grit.



A GROUP OF TOM BARRON'S WHITE LEGHORN COCKERELS. FIG. 64.



INTERIOR OF THE BARRON ENGLISH HENHOUSE. FIG. 65.

The floor of this building was made by putting about 20 tons of cinder on the ground, ramming down hard and level, then four tons of asphalt was poured on this, and a fine layer of cement finished the surface. This is one of the best floors on the farm, Mr. Barron writes, dry and serviceable.

The runs, one on each side of the building, north and south, are reached by windows at each end of the building. The runs are the width of the building, and are used alternately, the birds being kept in one about a week and then changed to the other while the first is allowed to freshen. This it does much quicker than here, owing to the abundant rain. Mr. Barron writes that it is impossible to keep the grass down without mowing the yards. This housing large numbers with outside runs, Mr. Barron calls the semi-intensive system.

The menu for these layers is as follows: In the morning there is fed a mixture of wheat, oats, cracked corn and "a little coarse wheat—say a decent sample of cockle" (this means wheat screenings), a few split peas and perhaps a little "dari." (Kaffir corn.) The more kinds of grain the better; the birds hunt more to see what new thing they can find. The litter is cut straw, chaff, peat moss, etc. There is a dry mash composed of one part ground oats to three parts wheat bran, this is open to the fowls at all times. At noon a little more of this morning feed is given, not a "feed," but just enough to keep them busy. Towards night they feed in the troughs a mash composed as follows: "One-third bran, one-fourth middlings, one-fourth biscuit meal, one-eighth meat meal, fish or granulated meat, about one-eighth clover meal or Alfalfa meal, changing the middlings sometimes for ground oats. This we mix with water from a large boiler, in which we have already a few bucketfuls of whole oats. The whole is well mixed in a mixing trough, until a crumbly mash, not sloppy, is made, and this is taken in a wheelbarrow and fed in the troughs. We give the birds all they can eat of this mash, and if there is a little left over we do not mind."

Mr. Barron says that the profit from such a house ought to be $500 a year, allowing for de-

preciation of buildings and birds, but not allowing for labor. I have given the mash in Mr. Barron's own words, because the "parts" make more than a "whole." The reader can fix that to suit himself. I don't have to. GEO. A. COSGROVE.

A FARMER ON FOOL LAWS.

I cut the enclosed clipping out of a Rochester daily January 14. My little grandson tracked a rabbit into a hole in a large oak tree near the barn, and wanted me to go out and help him get it out. I went with him and about five feet from the tree scared up a pheasant so nearly frozen that it could only just fly. I looked where it had been and there up close to it was another frozen to death. I have written to the State Conservation Commission to know what I shall do with it. I have no question but that from one-third to one-half of the birds through the country have frozen to death during the late cold weather. Some of the farmers around here have drawn out straw and thrown grain out for them to eat, and many more would look after them only for the present game laws. I was talking with a physician the other day who had just been out examining some school children for a health certificate, and I asked him what he thought of it. His reply was: "With all the red tape connected with it it's another one of those fool laws that the lawyers have been passing up at Albany, and there are a good many of them." The people are beginning to wake up. T. H. KING.

Tompkins Co., N. Y.

R. N.-Y.—The clipping which Mr. King refers to follows:

Bath, Jan. 13.—Some days ago a Mongolian pheasant was discovered by two State game protectors in the poultry yard of a farmer named Stamp, near Savona. As the pheasant is strictly guarded under the game laws, its presence with the Stamp poultry was regarded by the officers as a violation of the law on Stamp's part. Before Justice Frank Gay, Mr. Stamp related that he had found the bird in the fields, wounded, and placed it in his poultry yard to afford the bird a chance to recover. The justice submitted Mr. Stamp's version of the case to the State Conservation Commission which now recommends that the proceedings against Mr. Stamp be dismissed

AFRICAN GEESE.

Goose raising is one of the undeveloped industries of this country that has possibilities far beyond anything yet attained. It is no get-rich-quick scheme. In lurid attractiveness it cannot compete with gold mines and ginseng culture, but as a means of substantially increasing the income of the farm it holds out inducements to those who are favorably situated and like geese. Those who do not like them should not attempt to keep them. Most geese are more or less noisy, and finicky neighbors are liable to object to their music. A pond or pool of water is more necessary during the breeding season than for ducks. Geese need more room than most fowls; they will hardly be profitable without it; but given a pool of water, at least during the breeding season, and plenty of pasture, they are the most cheaply kept birds one can raise on the farm.

The three breeds of geese that are mostly raised for the market are African, Embden and Toulouse. Each breed has its merits and its champions. In this article we will consider the Africans. In style and portliness of carriage no other breed can compete with the Africans except the Brown Chinese, and they lack size. For early maturity, making the goslings marketable at 10 or 12 weeks of age, the Africans probably stand at the head of all varieties. They can be grown to a weight of nine to 11 pounds in 12 weeks on less feed than is given to Pekin ducklings in the same time, with a weight in the latter case of six or seven pounds. Of the two birds I consider the green gosling the superior on the table. It is only fair to say, however, that there is not now the large market for green goslings that there is for ducks, for no pioneer has as yet worked one up. Here is abundant opportunity for some one to enter an unsupplied market.

The general color of the African goose is a brownish gray, shading to light gray and white below and to dark brown on the back of the head and neck. The bill and knob, which every standard African must have, are black. Any orange will disqualify for the show room, but not for the table. Down the back of the head and neck runs a dark brown, or grayish brown, stripe which is peculiar to this breed and to the Brown Chinas. An adult African should have a dewlap, or fold of the skin, under the throat, the larger the better. Absence of this is another cause for disqualification in the show room.

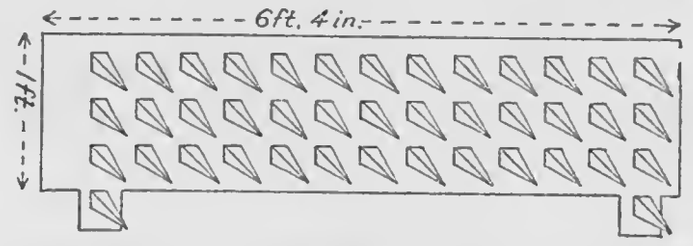
The African so closely resembles the Brown China geese in everything but size that it is probable that both breeds had the same origin, one being developed for size and the other for egg production. I have been informed that a prominent duck breeder, who always fed his birds heavily for marketing, purchased some Brown China geese and in a few generations had so increased their size that he exhibited them as Africans. The standard weight of an adult African gander is 20 pounds, of an adult goose 18; young gander 16 and young goose 14. These weights make the African a good medium sized table bird not so large as to be coarse. W. H. HUSE.

New Hampshire.

NUT NOTES FROM MARYLAND.

I have been greatly interested in several articles of late on the subject of nut culture, looking toward nuts as a source of profit. The article by J. Russell Smith brings it up fresh in my mind. I live about 20 miles north of Washington, D. C., elevation about 500 feet above tide or sea level, as taken from the bench marks made by U. S. Survey. Several times in the last 50 years our thermometers have marked 20 degrees or more below zero. I give this to show what our nut trees have been exposed to, and still flourish. On one farm, noted for the low temperature and very near running water, are several healthy pecan trees. I have no means of giving their ages; they are about 18 inches in diameter with fine spreading branches, an ideal shade tree. They bear a fair crop of nuts annually of moderate size; never saw one not well filled, or in any way inferior in quality to the average that we buy in the nut stores. I am raising some trees from these; do not expect to live to see them bear, but hope someone else will.

An old uncle had his life estate in the farm where the pecan trees are now flourishing; do not remember hearing from what source the seed or young trees came. He lived on the farm over 99 years. Two or three years since was a very cold Winter here. On the same farm 26 degrees below zero was the mark. With a much better crop of nuts than this season, last Spring a freeze when the young shoots on grapevines were grown over a foot in length, killing back many to the old wood, did not



Spotting Board for Transmitting to Cold Frames. Fig. 66.

injure the pecan trees, but no doubt reduced the crop of nuts.

We have two young trees of the English or Persian walnut near here on different farms. One came to the present owner in a flower pot, the other with a lot of apple trees from Maryland. The trees are about the same age, both planted with Southern exposure, on land of good quality. These trees have been producing nuts of about the same size and general appearance as those we got from California. There is one great difference in these trees in the time of blooming, and growth of the leaves. I think the difference amounts to at least two weeks. Such points of difference ought to be of use in starting an orchard. It takes time for such work; this being an auto age, so few young men are willing to start a slow job like growing walnuts from the nut.

I am nearly 76 years old; am making a very late start, nevertheless have planted nuts from each of the above trees, all carefully marked and hope someone will know more than I do. There is an old tree in Wilmington, Del., that has been producing regularly for many years. I think the nuts rather larger and perhaps somewhat thinner shell. I have a few nuts from this tree also planted. I am not trying to get up a corner in some special brand of Persian walnuts. I have seen one common black walnut tree produce 16 bushels. Most of the old trees planted by my great-grandfather have grown too valuable to be allowed to stand and bear nuts. When a walnut is three feet and over in diameter an offer of $100 to $150 on stump is too much for these times. In this locality the native black walnut usually bears freely some nuts larger and of much better quality than others. Men are much like sheep, all follow the leader. Would it not be far better if some would raise nuts instead of so many apples? I notice Persian walnuts seem to flourish near Rochester; suppose they are just seedlings. THOS. J. LEAR.

Montgomery Co., Md.

The final estimate of the Dominion Government shows that Canada's principal field crops in 1913 covered 35,375,000 acres, as against 35,575,000 acres in 1912, and their value at local market prices was $552,771,500, as compared with $557,344,100 in the preceding year. The principal crops were: Wheat, 231,717,000 bushels, value $156,462,000; oats, 401,669,000 bushels, value $128,893,000; flaxseed, 17,539,000 bushels, valued at $17,084,000. The wheat and oats crops for 1913 are the highest on record in Canada.

SOLUBLE CHEMICALS FOR IOWA.

Can you tell me without testing the soil what kind of chemical manure I should use on Fall or Winter wheat to increase the yield? Ground is rich enough to raise 50 bushels of corn or same of oats in any average year. I have sown 80 acres in wheat September last, and want to see how many bushels I can raise per acre. I think I should have a manure well up in phosphorus and potash. Will bone meal be the right kind, harrowed in as soon as ground is dry in Spring? This land is in Cerro Gordo Co., Ia., and was known as the quack grass farm; we have had only one crop on it; that was last year. Do you think it will pay to begin using commercial manure in Iowa, or would it be well enough to sow clover (as all our land raises good clover) and plow it in for manure? Does clover put in phosphorus and potash in soil, or only nitrogen? We intend to cultivate all this wheat in Spring, and would like to know the kind of manure (commercial) we should buy and how much to apply per acre. We have some land here in Dallas Co., Ia., that we have farmed 40 years; and begun on the original sod have made some tests in cultivation, but none with commercial manure. In 1913 we drilled 28 acres of Fall wheat, about 1½ bushels in last of September, and did nothing as to cultivation; in 1913 we put same piece in again and harrowed it and as ground was so hard that it hardly showed the mark of harrow we disked it with an eight-foot disk and hitched a harrow behind, which was all the cultivation it had. The result was that without cultivation the yield was 28 bushels per acre, but not as good quality. Last year with above work in cultivation on same piece we thrashed 39 bushels of 62-pound wheat per acre, and I wish to raise the yield to 50 bushels. This farm has always been manured with farm manure. We have enough to cover 30 acres per year. Will commercial manure help this farm? All wheat looks fine now, no snow here to amount to anything yet. H. L. L.

Waukee, Iowa.

No one can tell you without careful testing what such soils actually need, or whether chemicals will pay. General experiments and history indicate that phosphoric acid will prove profitable, probably potash and possibly nitrogen. Many experiments have been tried throughout the Central West, both in using chemicals and in testing and analyzing soils. As a rule these show that phosphoric acid is most likely to be found lacking, or most likely to increase the grain crops. This idea is corroborated by history. For many years these soils have exported grain and live stock—each ton of grain or live meat carrying a certain amount of phosphoric acid. These crops of course carried nitrogen also, but this has been in part restored by the clover and Alfalfa which has been grown and fed. The clover obtained some nitrogen from the air, and the greater part of what it contained was left behind in the manure. Here are figures to show what history teaches regarding the exports of plant food:

	Pounds to the Ton		
	Nitrogen	Phos. Acid	Potash
Live Stock	54	37	4
Wheat	38	11	16
Corn	33	12	8
Oats	37	13	9

While, as we see, it is possible to replace part of the nitrogen thus taken away, by growing clover or Alfalfa, the phosphoric acid and the potash thus removed cannot be supplied except in what we call fertilizing substances. Certain crops or certain forms of culture make plant food available to crops like corn or wheat. For example turnips appear to have some power to utilize potash which wheat could not use, and buckwheat or rye may do the same with phosphoric acid. Then when such crops were plowed under or fed to stock they might increase the available supply to some extent. Lime and land plaster, or perhaps salt, may also do something of this, but in general when potash and phosphoric acid become deficient in a soil fertilizer must be used to supply what is needed.

As we see, there is but little loss of potash in live stock farming, but when grain, and especially wheat, has been grown for some years. There is considerable loss of both potash and phosphoric acid. The chances are that soluble phosphoric acid will help your wheat at once and probably potash will be used at a profit. You can only tell by trying. Bone meal will supply phosphoric acid and a little nitrogen, but it contains no potash whatever. We do not know your price of bone meal, but probably acid phosphate will give you a cheaper form of phosphoric acid. The usual advice is to use three parts by weight of acid phosphate to one part of muriate of potash. You will obtain better results by drilling in this mixture at seeding rather than broadcasting and harrowing in Spring. The clover does not add potash or phosphoric acid to the soil. We should experiment with different quantities per acre—all the way from 250 pounds to 500. We do not consider ground rock phosphate in this discussion, as it seems that your soil may now be reasonably well supplied with unavailable phosphorus. In order to increase your large yield you need, if anything, a small quantity of *available* food. Finally, you are the only man who can answer your question and you can only do it by trying the chemicals.

DETAILS OF EARLY TOMATO GROWING.

PART I.

PRODUCING THE PLANTS.—Tomato growing is each year receiving more and more attention by South Jersey truckers. Practically every trucker grows this vegetable as one of the main money crops, few having less than 50 sash (enough for 8,000 to 10,000 plants) while many use 200 or more in producing plants for their own setting. An idea of the enormous output of tomatoes from this section can be gathered from the size of the shipments from the main shipping point at Swedesboro. From there daily shipments to distant points of 20,000 to 30,000 crates are not at all exceptional during the height of the season, while nearby markets are supplied in proportion.

ADVANTAGES OF EARLY CROP.—Growers specialize on the early crop and prices received are higher than for main crop tomatoes. Large profits depend on getting the bulk of the crop early; therefore all concentrate their energies toward getting early fruits. That they have succeeded is certain. Buyers have been attracted by the quantity and quality of tomatoes produced and each season they are on hand ready to buy tomatoes when delivered at the station. This avoids delays, loss in transit and the thousand and one troubles attendant upon shipping on commission and there is an absolute certainty as to the price received on each particular day. A good market of this kind is in part responsible for the extensive plantings but the success of the industry hinges mainly on the methods practiced by growers in getting tomatoes early.

WAGONS AT BRIDGEPORT, N. J., LOADED WITH EARLIANA TOMATOES. FIG. 67.

HOW GROWN.—It is the purpose of these articles to set forth as clearly as possible just how the crop is grown and how we get them early. It must be remembered that, although fairly profitable if late, the maximum profits are received only when an abundance of early fruits are secured. The variety grown is Earliana. This is used exclusively. Growers select and save their own seed in order to avoid loss from seed untrue to name and also to improve their own particular strain of that variety. The work for the season commences the last of January or the first of February when the soil is put in the hothouses in preparation for sowing the seed. These hothouses are cheap and simply constructed greenhouses built to utilize the ordinary hotbed sash, and heated by one or two large wood stoves with the stove-pipe running beneath the raised benches to give some bottom heat. The houses are 15 to 18 feet wide and long enough to furnish the necessary space for starting the seedlings. One thousand fine plants can be grown to the sash without crowding. About two inches of fine well-rotted horse manure is placed in benches, then covered with an equal amount of rich sandy loam. A fire is started and the house and soil thorough warmed before seeds are sown.

SOWING SEED.—The date of sowing seed varies with the season and the preference of growers, but February 15 to 20 is about an average. The seed are sown thinly in wide furrows about four inches apart, and covered lightly. After sowing more heat is given in order to germinate the seed quickly but after seedlings come up a more moderate heat is maintained with no attempt to force growth. Plants are allowed to remain in the seed bed until March 20 or 25, when if weather permits and plants are large enough to crowd, they are transplanted to cold frames. There has been little tendency on the part of growers to transplant more than once. Working on so large a scale they believe that the added stoutness and strength of the plant would not repay them for the extra work involved. That may or may not be true but nevertheless few practice it for by having plants growing thinly and without forcing, in the seed bed they are not at all spindling.

COLD FRAMES.—When it comes to handling plants in the cold frames our growers practice methods ahead of anything I know of as being used elsewhere; and therein lies the secret of intensive growing of early tomatoes on an extensive plan. Few truckers grow less than 8,000 to 10,000 plants, while many have 25,000 to 30,000; therefore paper pots, flats, etc., are out of the question and even if practical would not be used, because the methods practiced give not only cheaper plants, but also better-grown plants, with less labor and more perfect control of the moisture supply. Some of the cold frames are made double, most of them are similar to those used everywhere by gardeners, with slope to the south. The north side is boarded up to a height of 18 inches, and the south side is simply a 12-inch board stood on edge. Both sides are braced by posts set in the ground at distances of six to eight feet. The frames are made any desirable length, with the ends boarded up. The sash used here are 3½x7 feet, so the frames are made 6½ feet in width, which is wider than for those covered with the standard 3x6 sash.

PREPARING FRAMES.—Rafters are used between the sash, so they can be pulled down from the top for ventilation, or if need be pulled off altogether. Rafters are useful in saving labor, for by using them it is possible for one man unaided to give the necessary attention to beds, thus permitting the time of a second man or helper to be spent in other work at a season when help is hard to get and wages high. They also prevent sash from sagging in the middle. Neither sash or rafters, however, are placed on the frames until beds have been made to receive the tomato plants. In making the beds three inches of finely turned stable manure or stable and hog manure mixed is spread evenly over the bottom of the frame. A 3x3 inch piece of frame stuff six feet four inches long is a good aid in getting the manure on evenly. Commencing at one end of the frame measure off two feet and lay the three-inch gauge across the bed; fill this space with manure, using care to keep it level, and putting no more than will come to the top of the gauge. Then move the gauge two feet farther along and repeat. After repeating a few times the gauge can be moved for greater distances and finally, as one becomes accustomed to the work, will hardly be required at all. After the manure is in, the bed is ready for the soil. Growers use as good rich sandy loam as they can secure and place an even layer two inches deep immediately above the manure, using a gauge as for the manure. This completes the making of the cold-frame bed; sash and rafters are put on and everything is in readiness for the plants which are put in on the first nice day after March 20 or 25.

A HIGH CLASS AFRICAN GANDER. FIG. 68.

TRANSPLANTING.—When pulling plants from the hothouse they are first loosened at the roots by running a trowel below and lifting both soil and plants. Then by taking plants from the loosened soil, the whole root system is left intact and there is less wilting than if plants were pulled. Two to four hundred are pulled at a time and taken immediately to the cold frame, where everything should be ready to receive them. Transplanting is done by the aid of a "spotting board" operated by two men. The spotting board (see illustration) is simply a board one foot wide; long enough to reach across the bed, about six feet four inches, and fitted with three rows of pegs, four inches long, spaced as far apart as plants are desired to stand in the frame. At either end pegs extending beyond the sides serve as guides. The popular distance for setting in the cold frame is 4½ to five inches each way. Commencing at one end of the frame the spotting board is placed crosswise of the bed, pegs down. The men then step in on it, their weight pressing the pegs down in the soil. They then get off, lift the board carefully; shift it farther up the bed, with the two guide pegs in their corresponding holes on the outside row just made. They step on again, but before making a second shift, set plants in each of the holes made the first time. After plants are set the board is again moved and plants set in the holes just made. The spotting board not only serves to make the holes for the plants, keeping the rows straight, even and of uniform distance apart but also furnishes a place upon which the men can work when setting plants across the bed. If soil in the cold frame is dry it is best to moisten slightly a few hours ahead of transplanting, so that the peg holes made by the spotting board will not fill up. When moist enough to keep open the plants will not need water when set. Should plants be short the pegs need not be forced down their full length. The object is to set plants down to the seed leaves, and the depth of holes can be regulated accordingly. After dropping plants in the holes the soil is pressed about the roots with the fingers. Experienced men are selected if possible to do the transplanting, as it requires judgment in sorting the plants, so that only the stoutest and best will be set, and great care needs be exercised in pressing the soil firmly about the roots so that it really will be firm. However, if experienced hands are not available it is easy to learn, and rapid progress can be made with this method even by a beginner. The time required to set plants varies with the individual, but two men can easily set 10,000 a day and move their own sash.

CARE OF PLANTS.—Plants need considerable attention during their stay in the cold frame. They are kept watered and ventilated as seems proper in the judgment of the grower; sometimes hoed to hasten growth and finally well-hardened off by withholding water and ventilating freely. The sashes are covered with a thick layer of hay (salt hay is fine for this purpose) on every cold night, so as to retain the heat and avoid loss from frost.

Acid Soil for Potatoes.

Is a sandy soil that is acid suitable for potatoes without lime? It is a peach orchard planted in 1912; I wish to plant part with strawberries and part potatoes to be followed by berries. I. K.

Detroit, Mich.

An acid soil is suitable for potatoes, and we should plant them without the use of lime, as the lime will promote the growth of scab. The strawberries will also do better on the acid soil. If you are to grow strawberries in this peach orchard, the plan you speak of is better than that of using lime all over the soil.

Manure for Orchard and Potatoes.

To settle a dispute will you decide upon the following: 1. I have an orchard 15 years old which I intend to manure with strawy horse manure. Which is the better thing to do, and the more economical, to place the manure around the tree three feet from the trunk and as far out as the branches extend so thick as to prevent the growth of grass, or to spread the same amount of manure over the surface of the ground between the trees, cut the grass that grows and mulch the trees? 2. I usually fertilize my potatoes heavily. What effect would it have upon the fertilizer if I should apply several tons of barnyard manure per acre? A. P. M.

Pennsylvania.

1. We do not like to settle disputes, especially where we do not know all the particulars. How much manure to the acre will you use? Is the orchard in a strong sod, or is there just a growth of thin grass and weeds? It would make some difference. If there is a good sod we should put the manure out as far as the branches extend, cut the growth on the rest of the ground and pile it over the manure. 2. The manure on the potato ground will have little or no effect upon the fertilizer. It may help the soil to hold moisture, but on the other hand may increase the scab.

Mixing of Chemical Fertilizers.

What quantities of nitrate of soda, muriate of potash and acid phosphate respectively should I use in order to mix a 7-7-7-, a 2-8-10, a 6-8-10 and a 6-10-10 fertilizer from these chemicals without using filler? I should like to know how I can use them to mix any grade of fertilizer I wish. B. A.

Newman, N. Y.

The three chemicals you mention give average analyses about as follows, with others:

	Pounds in 100		
	Nitrogen	Phos. Acid	Potash
Nitrate of Soda....	16	..	..
Acid Phosphate	..	14	..
Muriate of Potash ...	..	..	50
Ground Bone	3	25	..
Sulphate of Ammonia.	20	..	..

Now if you want a 7-7-7 mixture this would mean in one ton 140 pounds each of the three elements. This would mean 875 pounds of nitrate of soda to supply the nitrogen, 1,000 of acid phosphate for the phosphoric acid, and 280 muriate of potash to provide the potash, or 2,155 pounds in all. If instead of 1,000 pounds acid phosphate you use 650 pounds, and 200 of ground bone, you will have your ton without filler. You can figure the 6-8-10 in the same way. Here you want 120 pounds nitrogen, 160 pounds phosphoric acid and 200 pounds potash in your ton. This would require 750 pounds nitrate of soda, 1,150 acid phosphate and 400 muriate, or 2,300 pounds in all. Yet this mixture would do it: 700 nitrate, 300 ground bone, 600 acid phosphate and 400 muriate.

Getting Ready for Grafting.

As the time approaches for top grafting it is well to be preparing for it. The materials for making the wax and proper tools for doing the work should all be got ready. The scions may be secured and stored safely, or at least the varieties to be used should be selected and the trees from which the scions are to be cut located, so that there may be no mistakes or delays about getting them at the right time.

There are different formulas for grafting wax, but a very common and suitable one is made from one pound of tallow or linseed oil, two pounds of beeswax and four pounds of rosin. There may be a little greater proportion of rosin if the climate or weather at time of grafting is quite warm. These materials should be melted together and while hot poured in a tub of cold water to harden sufficiently to handle with naked hands, and work into balls of convenient size. These should then be wrapped in greased paper and laid by for use.

A very good wax for applying with a brush while warm is made by melting together eight pounds of rosin, one pound of beeswax and one pint of linseed oil, adding a little common flour to stiffen it, and some put in a little lampblack to give it a dark color. Chunks of this preparation can be melted in a small can as needed, and kept warm by inserting in a larger can or bucket of hot water while being applied to the grafted stubs with a small brush. This prevents the grafter from daubing his hands with wax while at work, and the waxing can be done well and very neatly and quickly. The water may be kept warm by a lamp under the can.

A narrow-bladed pruning saw of the butcher saw style is the best kind to use. A stout pruning knife often comes handy for trimming and cutting off small branches. A well tempered and very sharp pocket knife is as good as any for trimming the scions ready for insertion. Instead of a common knife or the big, clumsy grafting knife that is often shown as one of the principal tools to be used, I use a very plain knife or splitting tool made from a narrow piece of the best spring steel about seven inches long, one-eighth-inch thick and three-quarter-inch wide. One-half the length of this piece should be drawn to an edge and carefully tempered and the end tapered as well, to be used in splitting the stock, and two or three holes are to be drilled or punched through the other end that a handle may be riveted on. The tapered end is used as a wedge and lever to pry open the split in setting the scion. A little club will serve as a mallet to drive in the knife in splitting the stumps. A light basket with a wire hook attached to carry the tools and scions will complete the outfit.

It is a great convenience to have the branches cut off and taken entirely out of the way before doing the grafting, and this can be done at any time from December until that time comes. But it would not be safe to cut down to where the scions are to be inserted for fear of some injury from severe cold on the fresh cut stubs. If a few inches are left so the grafter can cut them back to the proper place he can do the work faster and without the annoyance of the long branches and brush made in cutting them off. Good judgment is required in selecting the right branches to be grafted, and where the cuts should be made on them.

H. E. VAN DEMAN.

Hen Manure on Alfalfa.

We have a two-year-old Alfalfa patch, covered with the droppings from the henhouse last Fall. This year it grew up with a great superfluity of stalks. Was this due to some chemical in the manure, or what is the cause if known? Is there any remedy? W. H. M.

New York.

The hen manure was strong in nitrogen, and this forced the Alfalfa into a heavy growth. Nitrogen is the element which promotes the growth of stem and leaf, or that part of the plant which is above ground. It is not good practice to use too much nitrogen on Alfalfa or clover, for these crops are supposed to get most of their nitrogen supply from the air. The thing to do when too much nitrogen has been applied, is to balance it by adding phosphoric acid and potash. This you can do by using a mixture containing three parts of acid phosphate by weight, to one part of muriate of potash; 400 pounds of this scattered over an acre will give you good results.

Tankage for Fertilizer.

I have a lot of tankage from a slaughter house. Can you tell me in what form to use it? Would it be advisable to use it at the present time on rye, as it is in the raw state, or would it be better to mix with coal ashes, making a compost, and let stand until later?

Watervliet, N. Y. D. A. C.

You can mix the tankage in the manure pile and use all together later. A good way is to dry it out by dusting over it sifted coal ashes or dry dust or land plaster. The latter is best. Then the dry stuff can be broken up and spread like manure. Tankage contains nitrogen, but no potash.

is fully described—its glorious record of twenty years in the American orchard is accurately given. No one with room for a single tree can afford to be without this marvelous fruit. Of exquisite flavor—large, brilliant, waxy red. The book is *free*. Write for it.
Stark Bros. Nurseries and Orchards Co., Box 123, Louisiana, Mo.

WILT-RESISTANT TOMATOES.

In many parts of the country, a disease of the tomato known as the tomato wilt is doing considerable damage. This is a disease of the roots and stems, and it is caused by a fungus which lives over in the soil from season to season. The disease can readily be told in the field by cutting a suspected plant near the surface of the ground and examining the cut surface. If the stem is black on the inside, or has black streaks running up through it, the evidence is strong that the wilt disease is present. The disease kills the roots of the plants and plugs up the ducts in the stems in which the water is carried to the leaves from the roots, with the result that the plants wilt and finally die. The trouble generally is most conspicuous at about the time the first fruits are maturing.

As the fungus which causes the disease lives in the soil and within the tissues of the host plant, none of the ordinary methods of disease control, such as spraying, can be used to check it. Rotation of crops will help, as the fungus will gradually die out if tomatoes are kept out of an infected field for several years, but the results obtained by this method are often discouraging. The method of control that has given the best results is the growing of wilt-resistant varieties. In a recent bulletin of the Louisiana Experiment Station, the results with one such resident variety are given. That variety of plants can be selected that are resistant to wilt diseases has been known for some time. It is by the use of such varieties that the cotton industry has been saved in some of the sandy regions of the Southern States. Resistant varieties of tomatoes are perhaps more recent than are those of cotton, yet investigators at more than one experiment station have shown that such varieties can be selected.

To obtain a wilt-resistant strain of a tomato, it is necessary to grow the desired variety on a very badly infected piece of ground. If the plants are examined carefully during the season, it will be seen that the individual plants show a wide variation in regard to their susceptibility to the disease. Some will die very early, others succumb more slowly, and perhaps a few may be seen which remain healthy and show no signs of the disease. If seed is saved separately from several of these healthy plants and planted the following year on badly infected ground, it will be noticed that the progeny of some of these plants show a high degree of resistance to the disease, while the progeny of others wilt perhaps as badly as did the plants the previous year. If seed is again saved from the healthiest and best plants from the plots which show the greatest resistance, a higher degree of resistance will be seen in the third year from some of the plants. In a few years by this method of selection, a fairly resistant strain can be obtained.

Occasionally, also, the progeny of a single plant will show almost perfect resistance the first year. Such a plant as this was present in the tomato wilt plots on the Louisiana Experiment Station grounds in the season of 1910. In a plot that had grown tomatoes for several years and which was very badly infected with the wilt disease, a single plant out of several hundred was noticed that did not take the disease. Seed from this plant was saved and planted the following year on the same piece of ground with the result that only about 10 per cent. or less of the plants died with the disease, while check rows planted with seed of the same variety but not selected all died. Selections have been made each year from this strain, and at the present time, it shows almost perfect resistance. This strain is inferior in some ways, as it is from 10 days to two weeks later than ordinary plants of the same variety, and perhaps is not quite so prolific, but in localities where earliness is not essential and the wilt disease is very severe it should be satisfactory. C. W. EDGERTON.

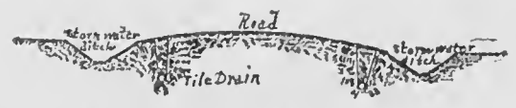
Louisiana Experiment Station.

"My life is made a burden by bill collectors." "I've discovered a way of geting rid of 'em that never fails." "For heaven's sake, put me wise." "I pay 'em, my boy."—Boston Transcript.

Draining a Swamp Road.

On the farm where I live, there is a private road leading from the main road to a tenant house. This road crosses a wet piece of ground, and for several rods is always muddy except perhaps for a short time in the middle of the Summer. It is a loamy soil, and dirt has been drawn on the road, but it soon settles down as bad as ever. What treatment is necessary to make this strip of road a good hard highway? E. GARDNER.

The road needs draining, but as it is a private road with perhaps only a limited amount of travel, simply draining the land of the field through which the



road passes might be all that is required. Possibly only one drain placed in the depression where the road is wet, and carried to the first available point of outlet would be effective in securing a good driveway. Where a road has any considerable amount of travel, so as to compact and puddle the surface it should be graded. Crowning in the center, with a storm-water ditch maintained on each side, and a tile drain three feet deep, under each side of driveway, as per diagram, will insure a roadbed free from soft springy places. A large part of the breaks which occur every Spring in our macadam and brick roads are due to a lack of drainage, for no wearing surface can be made to support heavy traffic on a soft springy foundation. The tile drains should be covered at least six inches with either gravel or crushed stone, as fine as can be used without passing into the joints. J. F. VAN SCHOONHOVEN.

Preparing for Grass.

I have several acres I want to turn into grass land; last Summer, part grew corn and potatoes, and part lay idle with plenty of weeds. I have just had it plowed and want to sow clover and Timothy in the Spring after harrowing, and then roll it down well. It is very fertile land. Can I do this with a good prospect of success, or what is the best method to pursue? W. W. T.

New Jersey.

This can be done, but in Northern New Jersey Spring is not the best time for seeding to grass. Fall is a better time, and if this land was very weedy it would be better to cultivate it fully before seeding. We should grow a crop of early potatoes or a crop of oats and peas for hay or fodder, then fit the soil well and seed.

Marl in Place of Lime.

What is the process employed in converting marl into lime, also the expense of such a plant? We have such marl, and years ago it made lime for most of the purposes for which lime was used.

Sardinia, N. Y. B. B.

A good shell marl is nearly as rich in carbonate of lime as a good limestone. We regard the marl as practically equivalent to finely pulverized limestone in the correction of soil acidity. It could be burned as limestone is burned, but we have never seen this done, and so have no practical information.

NEW YORK STATE NEWS.

"Woodlet Forestry."—Every man who owns a farm in New York State should send for a copy of Bulletin 9, "Woodlot Forestry," Conservation Commission, Albany, N. Y. It is a manual of forestry for use on farms and country estates. It points ont the importance and value of our wooded areas, stimulates the owners to the practice of forestry in their woodlots, and points out the principles and methods of correct forest practice. There are over 7,500,000 acres in forest regions in this State and over 20 per cent of the farm area is in woodlots. The total woodland area in the State is abont 12,000,000 acres or about 37 per cent of the total land area. It has been found that practically one third of the farm lands of the State go without improvement.

Bi-partisan Highway Board.—A bill has been introduced in the Senate to restore the Hughes system of a bi-partisan highway commission. It is proposed to have the law go into effect in January 1915, and it calls for a considerable reduction in salaries from what such commissioners now receive. The chairman will get $6,000; the commissioners, $5,000; the deputies and secretary, $3,500, and traveling expenses; and the division engineers, $3,000.

Suggestion For Co-operation.—At the State Grange meeting this week a proposition is to be made by delegates from Long Island to establish a bureau of information and markets in all counties of the State where possible, similar to that proposed at the last meeting of the Suffolk County Grange. W. P. Hartman of Medford is in charge of the Suffolk County bureau. The subordinate Granges are to establish sub-bureaus and thus keep in touch with the county bureau.

Physical Examination of Dairy Cattle.—There is possibility of some legislation this Winter for the physical inspection of all dairy cattle along the lines favored by the Holstein-Friesian people at their meeting in Syracuse. The proposed bill has been under discussion at a conference with Gov. Glynn, and he expressed himself as being in favor of such legislation. The radical feature of the measure is that a physical examination is required for all dairy cattle, not only for tuberculosis but for other diseases, and certificates of health must be secured or the animals condemned. It was stated at the conference that thousands of head of cattle in the State were afflicted with tuberculosis and that there is practically no means of suppressing the disease. The proposed law provides a definite and effective means, it is said, for the eradication of the disease.

State Tax Conference.—The third annual session of the State tax conference was held recently in Syracuse. Some new tax bills will be placed before the legislature this Winter. The suggested changes have to do with the assessment of corporation property by a central body, with the granting of supervisory powers to the State board of tax commissioners, and with the simplification of forms of local assessment rolls. The Syracuse conference recommended the following changes in the tax laws.

Assessment of corporation property at its situs.

Taxation of tangible personal property in the district in which it is located.

Unification of assessment and collection of taxes in towns.

All corporation real estate to be assessed by the State tax commission instead of by the local assessors.

Each special class of corporations to be taxed only by some special and uniform rule.

Additional powers for the State tax commission to make and enforce rules for local assessors and to order re-assessments.

State tax commission to provide the form of assessment oath.

Barge Canal Suits.—There are now claims against the State, growing out of the barge canal construction, amounting to $64,000,000, and in addition there are several important cases in the courts. The board of claims disposed of 482 cases last year and 278 were dismissed. About 1,133 cases are still pending. There are 1,993 claims for permanent appropriation of land amounting to $31,258,063. Awards have been made in 650 claims of this kind and 190 have been dismissed. Nearly 80 claims involving water power have been filed which amount to $28,518,730.14.

Farm-bred Horses.—Some of the farmers who attended a farmers' Institute at Heuvelton, St. Lawrence County, are working to encourage the breeding and exhibition of draft and general purpose horses. They have addressed a series of resolutions to the agricultural society of the county asking that they devote one day of the annual fair to the exhibition of farm-bred horses. They feel that the farmers of the county are entitled to receive some of the money offered in premiums for horses but more than that they believe it will encourge the breeding of more horses for farm use.

Grange Insurance Profitable.—The Grange fire insurance company which covers the counties of Jefferson and Lewis is making a fine record for itself and its patrons. The amount of insurance in force Jan. 1, of this year was $16,666,157 in 7,255 policies. The cost for losses and expenses last year was only $1.47 per $1,000 of insurance. This is a saving of $3.53 per $1,000 as compared with the rates of old line companies or a total for the year to members of the association of $58,831.53. The savings to members for the past 20 years has been $668,360, or an annual average saving of $33,418. J. W. D.

THE OHIO HORTICULTURAL SOCIETY.

Part II.

Have we a practical apple grader or sizer? From all the facts presented by papers, brought out in discussion and shown by machines actually at work, the answer for the apple is that we have not. Oranges and peaches are graded satisfactorily by machines. Apples of the right shape may be graded, but when it comes to flat apples, or those whose stem diameter is greater than the cross diameter, there appears to be an unsolved difficulty. It would appear from the best data presented at the meeting and apple show that a combination cleaner and grader of Western make is the best now on the market, taking into account speed, accuracy and minimum injury. The interest evinced in this subject shows that it is one of the most important now before the commercial farmer. Not only as a matter of economy, but as a sure means of securing an honest pack, the machine grader is a necessity. The topic of the "Transplanting and Care of Young Trees" was opened by Prof. V. H. Davis. He criticized the haste shown by many planting trees on poorly prepared land. A year or two spent in preparation was not lost time. One or two-year-old trees were usually better than older ones, because the roots were less injured. The operation of planting is greatly facilitated and the work better done by setting the trees in furrows that have been well opened by the plow. In heavy soils this secures much better drainage than where the holes are dug for each tree. Digging holes by dynamite is too expensive, except in rocky ground. Dynamiting heavy or impervious soil is a poor substitute for drainage. Mulching trees after planting is the best kind of insurance against lack of moisture, and in case of too much rain against lack of soil aeration.

The old question of fire blight or pear blight was recalled by Mr. E. L. Nixon of the Ohio Experiment Station. He made some careful tests to demonstrate whether the removal and destruction of blighted twigs was practical. The conclusions were that it is not. Blight germs giving pure cultures were found from six to 10 inches below the cuts that had apparently removed all of the blight. Trees carefully pruned of all blight showed later infections as much as those unpruned. The fact brought out seemed to indicate that we really know very little more about fire blight than we did a third of a century ago. About that time Mr. Burrill of Illinois discovered the cause, and isolated the bacterium that causes the disease. Soon after Dr. J. C. Arthur made a most exhaustive study of the subject, and but little that is really new has developed since. Two things are established beyond question, viz., 1. We know that the blight rages worse in some seasons than it does in others. 2. We know that some varieties of the pear and apple are more susceptible than others. Many believe that as too vigorous growth is one of the predisposing causes, it is asserted unhesitatingly that trees in sod blight less than trees in tilth. This does not appear to be fully demonstrated. A test made on the grounds of the Ohio State University and extending over many years showed practically no difference whether the trees were in sod or under cultivation.

"Fillers in the Orchard," was treated in a very interesting way by W. N. Scarff of New Carlisle. He described various garden fillers, small fruit, small tree, and farm crop fillers. He cited his own experience in one hundred acres or more of various large fruits. By a careful use of "fillers" he had been able to meet all the expense of the maintenance of his orchards and did this with no detriment to the orchard trees. He thought his trees were better because he was careful to keep the whole soil in such a condition that these filler crops would pay.

The cultivation of the cherry has attained large proportions in Sandusky Co., O. Col. F. Hutchinson of Clyde discussed some of the more important points in the cherry culture of that region. The largest single grower is A. C. Pickett, who has an orchard of something over 75 acres. Only three varieties are grown commercially, Dyehouse, Early Richmond and Montmorency. Although the May frost did great damage, Mr. Pickett harvested something over 99 tons of cherries. These were all sold to a canning factory. Questions brought out the fact that there was no difficulty in securing pickers from the locality, and a more or less expected difficulty had not arisen. Mr. Hutchinson is trying the experiment of planting cherry trees on a hilly sheep pasture, and continuously using it as a pasture. He has to meet some difficulties, and is by no means sure how the plan will work. Every tree has to be guarded from too close an acquaintance of the sheep while they are young, and trained too high for easy care and picking of fruit when they are older. It is an interesting experiment.

WILLIAM R. LAZENBY.

Obtainable Only from William P. Stark Nurseries, Stark City, Missouri

$1420 From One Acre of 133 Bearing Trees—

J. H. HALE Peach

You can obtain J. H. Hale peach trees *only* from William P. Stark Nurseries, Stark City, Missouri. Write us and get genuine J. H. Hale peach trees propagated from buds cut by Mr. Hale from his bearing orchards.

In his report on his 1913 crop Mr. Hale says:

" .... from one measured acre of 133 J. H. Hale peach trees we picked, Sept. 14th, 748 bushels, or an average of 5½ bushels or 8 crates per tree, over 95 per cent of this fruit being high-class merchantable fruit, selling f. o. b. at the farm at $2.00 to $2.50 per bushel ...."

From the same orchard the best grade of Elbertas brought but $1.25 per bushel. Sold by the basket or in carload lots, J. H. Hale peaches in open market invariably bring 50 per cent to 75 per cent more than Elbertas.

Note These Features:

Size: The J. H. Hale is ⅓ to ½ larger than Elberta, like a small cannon ball.

Color: A rich, golden yellow, overlaid with carmine.

Flesh: Solid and meaty as a cling, yet perfect freestone. Firm, but delicate texture. Smooth, thick skin, tightly drawn. Does not "squash down" in the basket. Skin practically fuzzless.

Flavor: A luscious peach flavor, far superior to Elberta.

Shipping: Stands shipping better than any known peach. Shipments have been made from New York to California and back.

Canning: Firm, rich flesh; holds shape in can. Gives brilliant, clear syrup and does not "rag." Better flavor than famous California Lemon Cling.

Hardiness: Hardier than any peach known—withstood adverse conditions last year that killed many trees of other varieties in same orchard.

Adaptability: A success in every peach soil and climate. Has been tested for more than ten years and in more than 3,000 plantings. Ripens early. Hangs late.

The largest and most complete brick packing house in the United States. Prompt service and safe delivery guaranteed.

Reserve Your Trees Now

Orders are pouring in from every point. One grower in California will plant nearly 500 acres. Bert Johnson, of Arkansas, is planting 10,000 J. H. Hale trees. From Michigan comes a call for 1,600; from Delaware for 1,000; from New York for 1,120—the shrewdest growers everywhere realize this great opportunity. They are the men who will take the early profits—the premium profits.

Our stock is limited. Many must be disappointed. Last year we didn't have enough to go around. Reserve your J. H. Hale trees NOW. We will ship early or late, as you direct. But don't wait! ORDER NOW!

For Genuine Delicious Apple Send Direct to Stark City, Mo.

William P. Stark has exclusive contract with S. L. Hiatt, owner of the original Delicious apple tree, for all buds, scions and propagating wood cut from the orginal tree for twenty years, from October 7, 1913.

Send direct to William P. Stark Nurseries, Stark City, Missouri, and get genuine, pure-strain, Delicious trees.

In the Chicago commission markets, in January, Delicious apples were bringing $3.25 to $3.75 per box, while Winesaps, McIntosh Reds, Winter Pearmains, Jonathans and Rome Beauties were priced at $2.25 to $2.75. Plant Delicious for big profits, but *be sure* your trees are William P. Stark grown and trained.

Other Good Fruits

We can quote lowest growers' prices on lots of 1 to 1,000 or more of McIntosh, Wealthy, Baldwin, R. I. Greening, Yellow Transparent, Black Ben Davis, Jonathan, Stayman Winesap, Duchess, Liveland Raspberry, etc. Peaches: Elberta, Early Elberta, Red Bird, Alton and all good varieties.

Our Prices Save You 30% to 50%

We sell by mail only—direct from our complete, illustrated catalog. No agents, no plate-book men. You get the true William P. Stark quality—heavy, spreading root-systems, tops developed and balanced to make perfect fruit-bearing heads; healthy, thrifty stock—*doubly guaranteed true to name* by a nursery that lives up to its guarantee.

To Avoid Error Address Stark City, Mo.

There is but *one* William P. Stark Nurseries; located at *Stark City, Missouri*. Mr. William P. Stark gives your orders his personal supervision. Remember the name—Stark City, Missouri—for the famous William P. Stark quality.

Write for New 120-Page Catalog

Lowest prices on every tested, dependable variety of apple, peach, pear, plum, cherry, quince, apricot, grape, currant, blackberry, raspberry, gooseberry, roses, shrubs and ornamentals. A practical handbook that every fruit-grower, large or small, should have. Your name brings it free. Write or use coupon.

Get at the root of things

when buying berry and other small fruit plants. Heavy top growth is actually a disadvantage unless the plant has sufficient roots to sustain it. Our bigger, better roots—due to unexcelled growing conditions — assure bigger yield of bigger berries. Get our New Catalog—lists only the better varieties, gives full cultural helps. No novelties that have failed to prove their merit under our severe tests are included. This dependable Small-Fruit Catalog is free—contains berries of all kinds, grapes, currants and garden roots. Write for it today.

LESTER LOVETT, Diamond State Nurseries, 32 1st Av., Milford, Del.

THE JOY Blackberry

brings joy to all who grow, sell or eat it. It is more luscious in flavor than any other Blackberry I have ever grown, and is very large, being almost as thick through as it is long. The canes are of iron-clad hardihood, so strong as to need no staking, and bear heavily *every* year. In the winter of 1911-12 every Blackberry in my trial grounds was damaged more or less *except the JOY*, which came through with every bud and terminal in perfect condition. In my long experience with this berry its canes have never been affected, even slightly, by orange rust or other disease.

Headquarters for St. Regis Everbearing, the best red Raspberry, and Caco, by far the choicest of all hardy Grapes. A full assortment of Strawberries, Raspberries, Blackberries, Grapes, Currants, Gooseberries, Garden Roots, Hardy Perennial Plants, Shrubs and Vines, Evergreen and Shade Trees, Roses, Hedge Plants, etc. Illustrated descriptive catalog, replete with cultural instructions, free to everybody. Established 1878. 200 acres. Quality unsurpassed. Prices low.

J. T. LOVETT

LITTLE SILVER, N. J.

Transplanting Papaw Trees.

I have a dozen or more seedling papaw trees five to six feet tall that I wish to transplant early this Spring. Can you advise me as to the best soil and location to set them in? I have decided to plant them in a group, on rich, moist but well-drained ground, in a sunny slope, with open southern exposure near the brook, but am not certain how far apart to set them, nor whether the papaw would grow best in the clear or under shelter and partial shade of other trees. Are they difficult to transplant successfully?

Hatboro, Pa. C. S. M.

The papaw (Asimina triloba) is hard to transplant, particularly when taken from the woods. If such specimens are to be transplanted, the work will be more successful if small, rather than large specimens are moved. Large, spongy-rooted plants like the papaw and Magnolia, are best transplanted about the time they start in to grow, rather than very early in the season. As large a ball, and as many of the roots as possible, should be secured. The papaw prefers a deep, rich, moist, but well-drained soil. Such conditions should be given the trees in their new location. Dig the holes for these trees just as soon as possible, two feet wide and two feet deep, and mix with the soil taken out a very liberal supply of leaf mold, peat, or other thoroughly decayed vegetable matter, and the soil returned to the hole, having first put such stones as came out of the hole back into the bottom for drainage. Some well-rotted horse manure can be mixed with that part of the soil going into the bottom of the hole, but it must not come in contact with the roots of the newly-planted trees. Let the soil settle if possible before planting, but this is not absolutely essential.

If the trees fail to grow with this treatment, the next best way to get papaws growing on the home grounds is to grow them from seed. Collect the seed as soon as the fruits are ripe. Wash the pulp from the seeds, then plant them directly in pots, pans or flats, and store in a cool place over Winter where they will not dry out. Or, the seed can be stratified in sand—mixed with sand—the sand to be kept damp, but not wet, over Winter, either by burying the box in which the stratified seeds are kept in the ground, or in a cool cellar. In any event, it is important that the seeds do not become dry. B.

Propagating Shade Trees.

I wish to make an addition to the information given concerning hickory trees on page 8. The hickory and walnut are very hard to transplant, and I believe that very few people will successfully transplant them. Under normal conditions they will lose a large percentage of the young trees. Mr. Jackson Dawson, the superintendent of the Arnold Arboretum, Jamica Plain, Mass., is one of the most successful propagators that I know. He plants the seeds in "flats." These "flats" are shallow boxes made from soap boxes about four inches deep, with four or five holes in the bottom for drainage. They are filled with good, well-drained garden loam, and the seeds are planted about three inches apart. This is done in the Fall. They are piled up in the cellar, in the cold pit or frame over Winter, where they will not dry out. In the Spring they are put out of doors and watered frequently enough to keep the soil moist. It is a little more work to grow the plants in this way than to plant the seeds in the ground, but the yearling seedlings are very easily transplanted the following Spring to the places where they are to grow.

To remove the seedlings from the boxes the sides or bottoms are removed and the soil washed from the rocks. By this method the tap roots are not broken. Where the young trees are grown in nursery rows, the tap roots are broken when being lifted, which causes a high percentage of mortality. I would suggest that if "C. J. O." intends to plant elm trees along a driveway, or in a position where he wants them all of the same character, that he graft his elms instead of growing them from seed. There are six or seven different types of growth of our common American elm (Ulmus Americanus) and if he will select his scions from the type of tree that he desires and top-work some seedling trees, he can then reproduce that particular type of tree.

P. T. B.

Start Your Garden Early

In response to a special demand I have manufactured a sash frame 8 ft, 4 in. long and just wide enough for a 3 foot space with southern exposure. In place of many small lights there is one large light of extra-heavy glass which allows the maximum of life-giving sunlight to reach seeds and plants. It is so simple a child can ventilate it. If desired the sash can be hinged. Price complete, ready to put together, freight prepaid anywhere in the United States $10.50 (a remarkable low price, made possible only by the large volume of my business).

If you would enjoy home-grown produce in June, start your garden in February. Send your order and check today. Shipments made promptly.

Planting instructions sent with each frame. Write for Catalogue of LUTTON'S GREENHOUSES and glass garden equipment.

Does Your Farm Drink Money?

It does if your house drinks rain. The pores of wood uncovered by good paint harbor moisture which swells and rots your buildings, makes them an easy victim of rough weather. Then repairs—and the costs of rebuilding do sting.

Dutch Boy White Lead

(Dutch Boy Painter Trade-Mark)

and Dutch Boy Linseed Oil

make a beautifying, impenetrable armor against sun and storm. Try this little experiment. Mix a paste of White Lead and water, then add linseed oil.. Watch the oil and lead get together, and squeeze the water out. Do you see why lead paint is waterproof? It is elastic, too—just enough to keep it from cracking and scaling. Not one drop of water can penetrate this armor to rot your wood. It saves you money. It preserves and beautifies your outdoor and indoor woodwork, carriages, wagons, implements, etc. Have your painter mix it or mix it yourself, any tint you want.

A Text Book on House Painting—FREE

Tells how to mix White Lead and oil for all surfaces, all weather conditions; how to choose best color effects, selecting "long-wearing" ones and fighting shy of "short-wearing" ones; how to estimate quantity of paint you'll need and probable cost of painting; how to test paint for purity. Write now for Farmers' Paint Helps No.251

Lewis Mfg. Co., Box C, Cortland, N. Y.

Lime With Fertilizers.

Will lime mixed with fertilizer be as good for the land as fertilizer alone? And how should it be mixed? N. A.
Sprakers, N. Y.

No. We should use the lime separately after plowing and harrow in. Then drill the fertilizer by itself. Most fertilizers contain soluble phosphoric acid and organic forms of nitrogen. The lime will make this soluble phosphoric acid "revert" or become less available, and set some of the ammonia in the organic forms free. While this would not cause much loss after the mixture is put into the ground, there is nothing to be gained by the mixing.

Slag Cinders as Fertilizer.

Why don't some of our Experiment Stations say something about the use of slag cinders or granulated cinders from our blast furnaces? I have used them, four tons to the acre and secured as good clover as where I put 1,500 pounds burnt lime. The cinders cost 15 cents per ton, lime costs $6.25; the haul is the same distance. Others have used several carloads, they get better clover with cinders than with raw or burnt lime. A. M.
West Middlesex, Pa.

The only property in slag cinders that would be useful on the soil would be the lime contained, and at the price given, if the haul is not too far, they may be useful for that purpose. All depends upon the percentage of lime. The fact that the furnace slag resulting from the manufacture of steel by the "basic" or Thomas-Gilchrist process, is used as a carrier of phosphorus, leads to some confusion on this point. This basic slag was formerly made at the Pottstown Iron Works in Pennsylvania, but has not been made in this country for a number of years. There is some talk of reviving this process of manufacture, but at present our supply of basic slag comes from Europe. As a carrier of phosphorus the genuine basic slag has proved to be a very useful vehicle. CHAS. E. THORNE.
Ohio Experiment Station.

Sweet Clover in New York State.

No attempt has been made to grow Sweet clover in this county except by a few farmers who are mixing it with Alfalfa. The plant thrives naturally here, and persists in all kinds of soil, even the stiffest kinds of clay. Cattle eat it, when tender, and if it can be fed so as to lie in a palatable condition, ought to prove a valuable fodder. Efforts are being made in this north county to get it established in pastures where feed is scarce, and especially where "devil's paint brush" has crowded out the better grasses and clover. There are many reasons why Sweet clover ought to have a place in our agriculture, but we need to test out its adaptability before it can be generally considered. C. S. P.
St. Lawrence Co., N. Y.

So far as I can find out, there never has been much seed of Sweet clover sown in this county. Sweet clover has come in along the roadbed of the Cortland Traction Company in those places where the roadbed had to be filled, the fill being taken from gravel pits in the town of Preble, in the edge of the limestone district. The plants made a rank growth the first year or two along the banks of these fills, but are gradually diminishing, How the seeds came to be there, no one knows, probably scattered by birds. There seems to be less growth each year.
Cortland Co. E. H. FORRISTALL.

As to the growth of Sweet clover in Clinton County, this clover does quite well, but very little is grown. It is considered more of a weed here than it is a forage plant. Alfalfa seems to thrive well on soils that naturally grow Sweet clover, and for this reason sections that grow Sweet clover are usually seeded with Alfalfa. Farmers generally think that the Alfalfa is far superior in feeding qualities. Sweet clover is very common here in Clinton County along the roadsides and neglected places. As yet very little is grown for feeding purposes. I think that we may be able to make use of this Sweet clover in building up some of our light soil so that we can grow Alfalfa on it. Much to my astonishment, this last season, I found Alfalfa growing on very light soil, soil that would blow in fact. C. B. TILLSON.
Clinton County. County Agent.

A REAL negro "mammy" of the old type came up the walk through the old-fashioned garden to the side porch. She had a basket of "fresh aigs" on her arm and was offering them for sale. "Are you sure they are perfectly fresh, auntie?" asked the lady who came out of the house. "Yes'um, they sho is all right, Miss Bess. Ain't nary disorderly aig amongst 'em."—New York Evening Post.

The principle—Two layers of glass with a ⅝-inch layer of dry still air

Now's the time to gain on Spring

If you wait on the weather to start your Spring plants, the market will be gone before you have anything to offer. An equipment of **Sunlight Double-Glass Sash** should be ordered early. They provide growing conditions even in the worst weather. The ⅝-inch air space between the two layers of glass shuts out the cold and holds in the warmth, letting in the light and protecting better than mats or boards.

Ten years' use has proved their success. Made of the best cypress; glazed or repaired in half the usual time; eliminating all need of mats or shutters; making plants early without undue forcing—they are simply indispensable to obtain the best results.

A new double-glass greenhouse

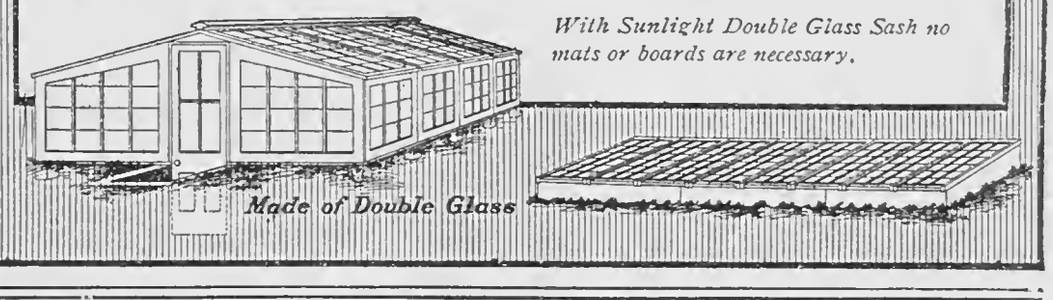
The Sunlight idea has been carried into an inexpensive greenhouse, 11x12, 11x24, 11x36 or 11x48 ft. in size. It is made of Sunlight Double Glass Sash, which are instantly removable when the greenhouse is idle for use on hot-beds or cold-frames. Thus they serve a double purpose. Sash ordered now for Spring work may be used on a greenhouse frame ordered at your convenience for next Fall or Winter.

Write for these two books today

One is a book by Prof. Massey, an authority on hot-bed and cold-frame gardening, and the other is our FREE catalog. If you want Prof. Massey's book, enclose 4 cents in stamps.

Sunlight Double Glass Sash Company

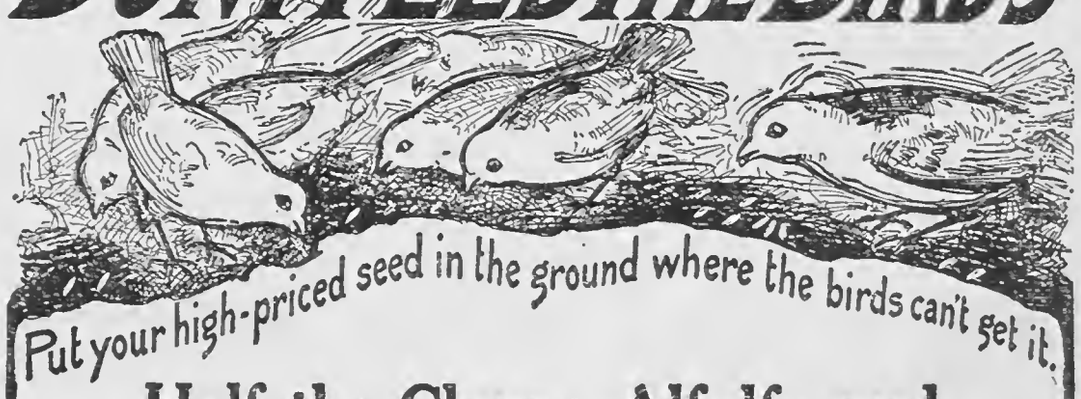
924 East Broadway **Louisville, Kentucky**



Made of Double Glass

With Sunlight Double Glass Sash no mats or boards are necessary.

DON'T FEED THE BIRDS



Put your high-priced seed in the ground where the birds can't get it.

Half the Clover, Alfalfa and Grass Seed Planted is Wasted

There never was a more sinful waste of seed than broadcasting

Broadcasted seed is scattered to the four winds of heaven; part is washed away by rain; another portion goes to feed the birds; much of it lies on top of the ground and never makes healthy plants.

In broadcasting, there is usually sown an average of 66 clover seeds on a square foot of ground. This is **more than twice too much,** and the results are doubtful, at that.

If you intend to sow clover in your winter wheat, the Superior Alfalfa and Grass Seed Drill will show you a gain of about FOUR DOLLARS per acre.

If the seeding is done in old pastures and meadows or run-down alfalfa fields, the discs open proper furrows, cultivate, let the air in and put the seed in the ground where it is sure to grow. This method increases the hay tonnage and forage. It also saves half the seed.

In sowing Hungarian Grass or Millet, half the seed is saved and the tonnage is greatly increased over other methods.

The Superior Force Feed accurately sows Crimson and Red Clover, White Clover, Alsike, Alfalfa, Clover and Timothy mixed, Timothy alone, Red Top Fancy, Red Top, Blue Grass, Millet, Flax, etc., in widest ranges of quantity.

SEND FOR THE SUPERIOR ALFALFA DRILL FOLDER

R. H. SHUMWAY, Rockford, Illinois

EVENTS OF THE WEEK.

DOMESTIC.—Thirty yachts, chiefly of the motor driven type, were destroyed at Port Washington, Long Island, Jan. 25, in a fire that wiped out the buildings and marine railway plant of the Manhasset Shipbuilding Company, formerly known as the Stationary Marine and Motor Supply Company. The estimated loss is $250,000.

Suits were filed at Little Rock, Ark., Jan. 24, by Attorney General William L. Moose against six cotton oil companies of that city asking that they be ousted from the State and that fines of $4,215,000 be assessed against each because of alleged membership in a trust formed to control the price of cottonseed. Defendants in the suit are the Buckeye Cotton Oil Company, the Arkansas Cotton Oil Company, the Little Rock Cotton Oil Company, the Southern Cotton Oil Company, the Dixie Cotton Oil Company and the Rose City Cotton Oil Company. The alleged trust has been in operation from September 1, 1911, it is charged.

Approximately 4,000 bales of cotton were destroyed or damaged at Memphis, Tenn., Jan. 22, by fire, which swept the warehouse of E. W. Trout & Company. The loss is estimated at between $200,000 and $300,000. Three firemen were slightly injured.

Indictments were returned at New York, Jan. 26, by the federal grand jury holding ex-Representative Lucius N. Littauer and his brother, William Littauer, under the charge of smuggling jewelry into the United States. The Littauers, members of the wealthy firm of Littauer Brothers, glovers, of Gloversville, N. Y., were indicted under Section 3082 of the Revised Statutes, which provides a fine of $10,000 or imprisonment of not more than two years, or both, for smuggling. The jewels, believed to be worth $40,000, are said to have been brought into the port last November by Lucius Littauer and were intended as a present for Mrs. William Littauer, the wife of his brother. The gems are said to have been concealed in a trunk.

Five lives here have been lost, thousands of head of live stock have been drowned, all steam and electric railroad traffic has been completely tied up by floods and property has been damaged to the extent of millions, as a result of the heaviest rainstorm in southern California in 18 years. From Tehachapi south to San Diego all cities and towns were suffering from floods Jan. 26. At Santa Barbara a cloudburst in the mountains sent a raging torrent down through that city and Montecito. Louis Jones, vice-president of the First National Bank, and his wife were drowned in the flood which swept through Santa Barbara. Many houses in the city were wrecked and washed away. Almost every bridge in the region was destroyed. Telephone and telegraph lines were completely out of commission. It is estimated that $750,000 damage has been done. Two were drowned and $100,000 damage done by floods throughout the San Joaquin Valley district.

One man was severely burned and property valued at $750,000 destroyed, Jan. 27, when fire swept the five-story brick building at Irving and Van Brunt streets, Brooklyn, N. Y., occupied by Hills Brothers Company, fruit packers.

Most of the New York bomb outrages of 1913 were explained in General Sessions before Judge Rosalsky, Jan. 27, by two men, each only 24 years old, who planted and set off between them about 130 packages of dynamite. Alfred Lehman, called Schmitty, and Rocco Picciarello, known to the gangs as Zump, were the men employed by blackmailers. They told their cold-blooded stories of arson, thievery, thuggery and bomb planting at the trial of Angelino Sylvesto, accused of helping in an attempt to explode a bomb at 170 East Houston street on the night of August 31 last. It was bomb No. 110 of the series of 1913. Schmitty and Zump averaged about $30 apiece on dynamite jobs. This money they were likely to spend "sporting around" and to eke out a living they practised all kinds of theft.

ADMINISTRATION.—The following bills are to be prepared for the supplementary anti-trust legislation recommended by the President: First, a bill creating the Interstate Trade Commission. Second, a bill to regulate directorates of corporations and to prohibit interlocking directorates. Third, a bill defining unlawful monopoly or restraint of trade. Fourth, the trade relations bill, which among other things forbids unfair trade practices, such as underselling in one locality to stifle competition and recouping the losses thus sustained by raising prices in localities where there is no competition. The bill forbidding interlocking directorates provides two years of leeway, during which the holding membership on the boards of directors of interstate coal, steel and iron, common carrier corporations, banks and trust companies may be relinquished. A second section of the bill specifically forbids the holding of directorships by one individual in two or more financial institutions enjoying the protection and provisions of the new currency law. A fine of $100 for every day during which the provisions of the foregoing section are violated is provided. A fourth section establishes the dictum that disobedience of the eliminating provisions of the measure shall be sufficient to constitute conclusive evidence of infringement of the Sherman anti-trust law itself by the corporations whose boards contain duplications of individual directorships. The bill to make clearer the definition of monopolies and restraints of trade specifically forbids the following: Combinations to create or carry out restrictions in trade or to acquire a monopoly in any interstate trade, business or commerce; to limit or reduce the production or increase the price of merchandise or of any commodity; to prevent competition in the manufacturing, making, transportin, selling or purchasing of merchandise, produce or any commodity; to make an agreement, arrangement or understanding, directly or indirectly, to prevent the free and unrestricted competition in the sale, production or transportation. The penalties for violating any of these provisions run against any person, firm or corporation, and the fine shall not exceed $5,000, with imprisonment for one year as an alternative, or both penalties, in the discretion of the court. A section of the bill makes the officers, directors and agents of the corporation equally guilty with the corporation for any act proved against the corporation. The trade relations bill proposes to add five sections to the Sherman law, defining what shall be classed as unlawful trade practices. Another section of this bill permits an injured party to take advantage of proofs established by the Government as to the character of any unlawful combination in the suit against such corporation to recover damages under the Sherman law. A section of the anti-trust programme specifically prohibiting holding companies is to be added later.

PANAMA.—An executive order outlining the permanent organization of the civil government of the Canal Zone was signed by the President, Jan. 27, and coincident with its promulgation the official announcement was made that Col. George W. Goethals had been appointed the first civil Governor of the Canal Zone. President Wilson's order creating the civil government becomes effective on April 1 next, from which date the Isthmian Commission, together with the present organization of the Panama Canal and the Canal Zone, will cease to exist. The President, however, will ask Congress to pass a resolution creating the retiring members of the commission a committee in charge of the arrangements for the celebration for the opening of the canal. Under the terms of the executive order the Canal Zone government will consist of a department of operation and maintenance, a purchasing department, a supply department, an accounting department and a health department. Provision is also made for an executive secretary. All the departments will be under the direction of the Governor, subject to the supervision of the Secretary of War.

FARM AND GARDEN.—The Phillip herd of buffalo, kept in a ten-thousand-acre pasture near Fort Pierre, S. D., has been placed on the market by Phillip Phillip and George Phillip, administrators of the estate of their father, James Phillip. This herd of buffalo, the largest in the United States, now includes seventy yearlings, fifty-five two-year-olds, and 275 older.

A white radish, three feet high, 36 inches in circumference and weighing 12 pounds, was forwarded from Los Angeles to William J. Bryan, Secretary of State. The radish is said to be the largest ever produced in Southern California. The vegetable was grown by Japanese truck gardeners.

The Ohio Percheron Horse Breeders' Association will meet February 4, in the Judging Pavilion, at the Ohio State University, Columbus, Ohio. Mr. A. P. Sandles, President of the Agricultural Commission of Ohio, has been asked to be present and talk to the breeders of Percheron horses. Mr. J. H. S. Johnstone of the Live Stock World, Chicago, Ill., has consented to come and talk to the members of the association upon the subject of "Draft Horse Futurities."

The first Missouri high school to incorporate poultry culture as a part of the regular school curriculum on a practical basis is at Oak Grove. Prof. J. F. Blyholder, the principal, and his class in poultry husbandry have begun operating a 150-egg incubator in the basement of the school building and have a Barred Plymouth Rock hen sitting on 15 eggs in the same room to test out both methods of incubation.

CONDITIONS IN RURAL NEW YORK.

Relating to the subject of abandoned farms, would say that while there are no such here, in the strict sense of the word, one can buy about any farm in this part of the country at prices ranging from $10 to $30 per acre, very few if any of them selling for anywhere near what it would cost to replace the buildings now on them. These are good farms, farms that are capable of making money under reasonably capable management, mostly used for dairying now, but capable of raising good crops of grain and hay. The great drawback is that we are about 20 miles from railroad, and it costs us $4 per ton for cartage now, although it will likely soon be done for less, as we shall probably soon have a State road. This matter of cartage is a benefit to the grain farmer, not nearly enough grain being raised to supply the demand, so the seller is able to add the $4 per ton to his prices. I have in mind one young man who bought one of these farms and stock for $3,600, ran in debt for the entire amount, and paid for it at the rate of $500 per year and interest, and now has a good bank account, and there is no reason why anyone of equal ability can not do the same on any equally good farm, and this one is a poor one, except for dairying. It is a good fruit country, apples, and in places peaches doing finely, and it costs but 25 cents per barrel to get apples to the river boats or railroads. The great trouble here seems to be want of help to work on the farm, the farmers themselves having very few or no children, and what few there are are leaving the farms; too dull for them here. We have a fine climate and a pleasant country to live in. A few miles north from us, farms can be bought for still less money, and in these days of high prices for meats of all kinds, it seems to me there are many good livings in this business. A farmer from Nebraska bought one of those hill farms a year or two ago, and says he would not give it for any section of land in western Nebraska, and he has since bought two other farms near him and now owns about 600 acres, making it look as if he meant what he said. SILAS DEAN.

Greene Co., N. Y.

COAL TAR ON TREES.

Last Spring I set out some Burbank plum, Montmorency cherry and Yellow Transparent apple trees, also some locust and nut trees. A neighbor told me to put coal tar around the base of those trees for eight or 10 inches above the ground to prevent borers working. I took a small paint brush and painted them as directed, beginning at ground and painting up eight to 10 inches. The other day I broke one of the White walnut (butternut) trees over in letting my team get advantage of me, and inside the outside bark where the tar was put on, it is dark brown. Have I ruined all my trees? J. F. H.

Spring will determine this surely, but we fear you have injured or ruined the trees by painting with tar. We found that coal tar varies. Some of it is surely dangerous to paint on young trees and we never advise its use. It is a much safer plan to dig the borers out with knife or wire. It may be possible to "bridge-graft" some of these if the bark is destroyed all around. This is done by inserting one end of the scion into live wood below the injury and bringing the other end up to live wood above the dead bark.

SETTING UP WIRE FENCE.

Having read the article "Putting Up Wire Fence" in THE R. N.-Y. of May 17, 1913, by W. E. Duckwall, of Ohio, I will say his way of bracing the end post and tying down fence at the foot of a hill was tried out here several years ago and found wanting, for the wire would rust off at the top of the ground in two to four years, and the fence soon lost its tension by the end posts pulling over. We have overcome the trouble by putting in an iron rod to come up above the top of the ground four or five inches, with a hook or loop in the end to put the wire through. Both posts at each end should be of the same size and durability, for what good is one post when the other has rotted off? E. F.

Alexander, O.

AIR PRESSURE AND SPRINGS.—The statements of R. L. C. on page 1342, under the title "Water Will Seek Its Own Level" were interesting to me because of an attempt to explain the same phenomenon in the case of natural springs, i. e., the rising of water in springs (or the appearing when the spring is dry) before a storm. The only explanation I have ever read was that probably the air was humid on account of the approaching storm that dew enough was absorbed to raise the springs. This has always seemed an improbability, if not an impossibility, and I had thought of the change of air pressure as the more probable cause before I ever saw R. L. C.'s statement. I am glad to have my conclusions confirmed. W. H. HUSE.

COMING FARMERS' MEETINGS.

Farmers' Week, Ohio State University, Columbus, Ohio, February 2-6.

Connecticut Vegetable Growers' Association, Foot Guard Armory, Hartford, February 4.

Ohio Percheron Horse Breeders' Association, Ohio State University, Columbus, February 4.

Midwinter meeting Michigan State Horticultural Society, Benton Harbor, February 5-6.

Sixth National Corn Exhibition, State Fair Grounds, Dallas, Texas, February 10-24.

Granite State Dairymen's Association, Concord, N. H., February 12.

Massachusetts Agricultural College, Amherst, ten-weeks' Winter course, January 6 to March 13.

Thirty-ninth annual meeting of the American Association of Nurserymen, Cleveland, O., January 24-26.

STRANGER: "I should like to speak to Mr. Meyer, please. He asked me to meet him here to-day." Domestic (sadly): "Dear, dear, he must have forgotten all about it. I'm sorry, sir, but he went and died yesterday."—Credit Lost.

DIBBLE'S SEED FARMS

HEADQUARTERS FOR FARM SEEDS

If you want good crops, you must plant *good* seeds. Dibble's Seeds are not only good seeds but they are the *Best* Seeds money can buy. We are extensive Farmers and Seed Growers located in the Genesee Valley of Northwestern New York. Honeoye Falls is in Monroe County, the second county in the value of its agricultural products in the United States.

We are located where Farm Seeds are actually grown. Our 1,600 acre Seed Farms are well tilled, very fertile, productive and profitable. Our warehouses are 400 feet in length, and at this writing have over 100,000 bushels of Farm Seeds in store, and we sell direct *from our Farms to yours.*

We have but one grade, and that the best obtainable. Better seeds than ours cannot be had, nor can you get the same high quality elsewhere for so *little money.*

Dibble's D. B. Brand

Northern Grown Alfalfa, Clover and Timothy Seed 99.50 Pure

or better is the "Cream of the Crop," the same as we use on our own Farms growing 600-800 tons of hay yearly. We have about one hundred acres of Alfalfa producing around four hundred tons annually. Our experience is worth thousands of dollars to you. Alfalfa and clover seed is cheap this year and the quality was never better.

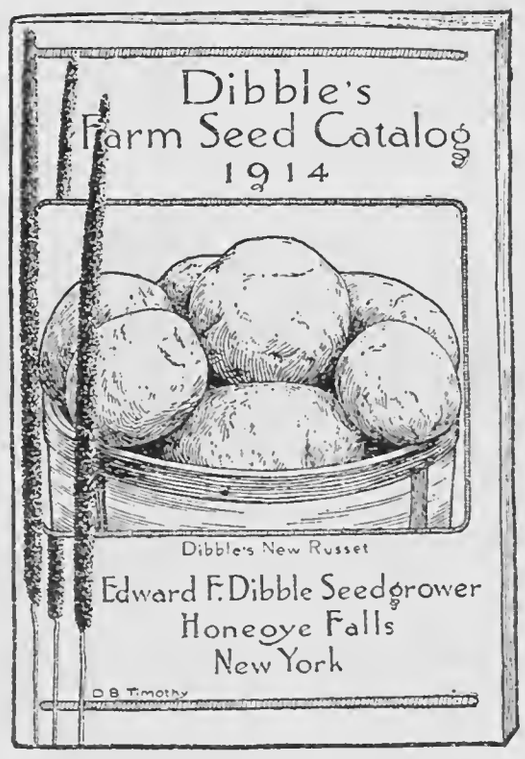
Dibble's Seed Corn

is in a class by itself. Our requirements are that it must be from hand-selected ears, thoroughly dry, screened and recleaned, and must show a germination of above 90%. Germination tests made to date average over 95%. In fact, real *Seed Corn.* If you are interested in Flint for husking, we can supply you with a variety that has made 230 bushels per acre and has produced 247 bushels from one peck of seed. In Dents for Crop or Ensilage, we have an extra early to use where seasons are short and a big grower maturing in 100-110 days, which we recommend for general use; also a Mammoth White, growing 15-20 feet high under favorable conditions, called by one of our customers "King of Ensilage Corn." We have five silos, grow 100 acres for ensilage annually, and have proven by field trials the best varieties for the Eastern States.

Dibble's Seed Oats

New Heavyweight originally from the cold Northwest, early, big stiff straw, enormously productive with thin hulled grain weighing 40-45 pounds per bushel. One field produced over 1,000 bushels last year, averaging 87 bushels by measure, weight 43½ pounds, or *118 bushels per acre* by weight.

Twentieth Century introduced by us several years ago. Scores of farmers have reported yields to us of from 80-110 bushels per acre, and on our own farms growing from 100-200 acres annually, they have produced over *twice* the average of the United States for the last dozen years. Owing to a bumper crop of oats in our section prices are very low.



Dibble's Seed Barley

New early Six Rowed from Wisconsin yielded 55 bushels per acre right here in Western New York last season, and Dibble's Canadian Six Rowed with a twenty-year record of from 40-54 bushels per acre on the Dibble Farms.

DIBBLE'S ALFALFA, CLOVER, TIMOTHY, CORN, OATS, BARLEY, etc., are sold on a ten days' approval your-money-back-if-you-want-it plan, subject to your test, the test of your Experiment Station, or that of the Department of Agriculture in Washington; the fairest, squarest deal ever given the American Farmer by any Seedsman.

Dibble's Seed Potatoes

are northern grown, from select stock seed, and are grown under climatic conditions and in suitable soil for the best development of each kind. After harvest they are carefully assorted and stored in our frost-proof storage cellars and reassorted into new barrels or sacks the very day orders are shipped to our customers, thereby assuring them of choice, properly selected stock that is free from frost, sure to grow and produce crops that pay big profits. We have full stocks of all the standard sorts—Cobblers, Six Weeks, Rose, Queens, Manistees, Moneymakers, Giants, Gold Coins, Green Mts., Rurals, Raleighs, and a score of others; also a *new main cropper* introduced by us two years ago, that should be grown by every farmer. Several hundreds of our customers who have tried it write that it has *outyielded all other varieties in the same field,* and over *one hundred* say that *it beat other kinds over two to one.* Try Dibble's new potato; grow *two* tubers where *one* grew before and *double your crops.*

60,000 bushels of Seed Potatoes awaiting your orders, and at a price you can afford to pay.

Dibble's Farm Seeds Free

Send us your name and address on a postal card, mentioning the number of acres you are farming, and we will send you free *ten liberal packages of Dibble's Farm Seeds* for testing on your own farm, and also *Dibble's Farm Seed Catalog,* the leading strictly Farm Seed Book of the year. *Dibble's Catalog* is written by a *Farmer* for *Farmers.* It tells the truth about the Farm seed situation. Illustrations are all from photographs. It is a safe guide for every Farmer as it gives the result of our own experience farming 1,600 acres. It contains a map showing how near Honeoye Falls is to *you.* Write for it *Now.*

Address EDWARD F. DIBBLE SEEDGROWER, Honeoye Falls, N. Y. Box B

Onions and Celery on Sandy Loam.

Can onions and celery be grown successfully on a light sandy loam? What kind of fertilizer and how much should I use on these crops? A MC.
Ohio.

For best results onions should have a rather moist, deep rich sandy loam. Bottom land is preferred, as it is more or less of alluvial formation, and is also more retentive of moisture than upland. However good marketable onions can be and are raised on the higher and drier soils, when properly fitted for the crop. If the land you speak of is ordinary farm land, such as is used for the production of cereals, you would do well to delay cropping it to onions for it least another year, as it is scarcely possible to get a paying crop without some advance preparation in the way of enriching the soil, etc., which can hardly be done sufficiently and properly under a year. I would therefore recommend that you apply broadcast not less than 50 tons of partially rotted manure to the acre (or at that rate) this Spring, turn it under, plowing as early and deeply as possible, then about the middle of May run over it two or three times with the disk harrow, about four inches deep. This will thoroughly incorporate the manure near the surface with the soil and put the soil in good tilth. Then plant the land to sweet or field corn, or if you can afford it, sow the land to cow peas, Canadian field peas or Soy beans to be turned under in the Fall. This will put an additional supply of nitrogen and humus in the soil that will tell on the crop of onions that is to follow. The following Spring plow deeply, disk the land well, then apply as a top-dressing pure bone meal and guano at the rate of one-half ton of each to the acre, or commercial fertilizer containing ammonia, 2%; available phosphoric acid, 8%, potash, 7%, at the rate of one and one-half tons to the acre, harrow in with the smoothing harrow. If stable manure is not available, sow the ground early to oats, turn under when in the stage of ripening, sow to cow peas and turn under in Fall, and the next Spring plow and fertilize as directed when manure is applied.

Celery is naturally a swamp plant, and thrives best in a moist rather cool soil, but such soils are not always available, and the higher and drier soils have to be used. For this crop you should apply old well-rotted manure to your land at the rate of not less than 30 tons to the acre, which may be supplemented with commercial fertilizer containing ammonia, 4% to 5%; available phosphoric acid, 8%; potash, 7%, applied broadcast after plowing at the rate of one-half ton to the acre. Plow the land as deeply as possible. Both these crops require good feeding to produce a good marketable crop, without it they will not be profitable to grow. K.

Property in Wild Bees.

1. If a man finds a tree on his own land marked as a bee tree with the initials thereon, has he a right to cut the tree without trying to find out or notify the man that marked the tree? 2. What would the penalty be if he did cut the tree? 3. Also is it lawful in New York State to poison jack rabbits that are destroying trees? J. H.
New York.

1. Marking a bee tree found on the land of another with the initials of the finder does not vest an exclusive right of property in him, and he cannot cut it without the owner's permission. Indeed, being on the land of another is technically a trespass.

2. If the owner of the land cut the tree there would be no penalty whatever. He has a right to do it; but there is a custom recognized throughout parts of New York State by which a finder of a bee tree who marks it with his initials has a qualified property right in the tree, but this is not recognized in law, and he has no property in it unless the owner of the land gives him the permission to go on and cut it.

3. The laws of New York regarding taking of rabbits are quite strict, but nothing in them shall prevent the owner or occupant of the enclosed or occupied farm lands, or their employees, from taking hares and rabbits on such owner's or occupant's premises at any time to prevent their injuring the property. The penal law of the State makes it a misdemeanor for anyone unjustifiably to administer any poisonous drug or substance to an animal, or unjustifiably expose any such drug or substance with intent that the same shall be taken by an animal, whether such property be the property of himself or another. But it is a question whether this does not apply to animals which are the property of another and not to wild animals. It would be safer, however, not to poison these rabbits. M. D.

Farm Bargains in the East.

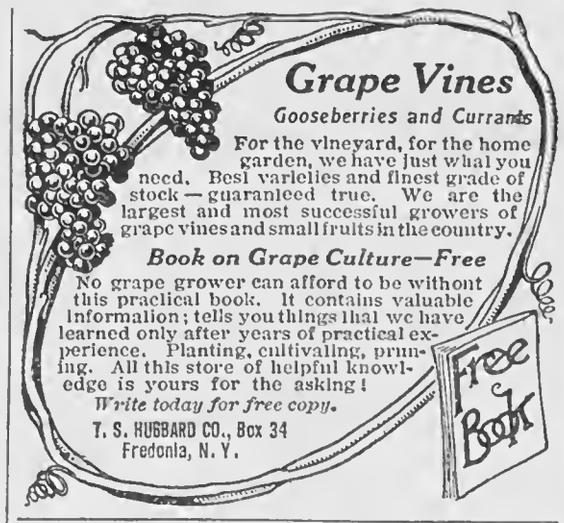
I have been interested in a series of articles on abandoned and neglected farms in the region between the Hudson and Connecticut rivers, appearing in one of the "popular" magazines, in which one is told all about "broad gauge" farming by men who are not farmers. In some of these articles the statement is made that lands as level and as black as the prairies of Manitoba lie in this region entirely neglected, and can be had at practically nominal prices. Is not this, in fact the whole series, rather misleading. I know something of the quality of the lands in Manitoba and what they could be worth if in New York State.
Rochester, N. Y. Q. W. B.

Within the past three years, an equal number of my New York friends have been smitten with "back-to-the-land" fever. Each of them in turn traversed the territory mentioned for weeks and even months. Advertisements and letters galore supplemented their personal observations. In due time one of them located in Windham County, another in the northwest corner of New London County, while the third has never been able to locate anything approximating a bargain. Their experience is sufficient comment on any and all magazine "stories" about "land as level and black as the prairies" which may be had at "nominal prices." The man who goes hunting for that kind of bargain is booked for a lot of disappointment.
Connecticut. C. M. G.

Fruit Buds.

Cold weather has hurt the peach buds pretty badly in the State, still with the exception of Elberta there are plenty left for a good crop, and even that variety will give some fruit all over the State, except possibly on the very highest hills which suffered the worst this year on account of high wind for 36 hours and temperature five to 10 below zero. No "smudge pots" for such a game.
Connecticut. J. H. HALE.

CEMENT OR CLAY TILES.—Our reports indicate that on the whole drain tiles of baked clay are more satisfactory than those made of cement. On some soils, and with certain kinds of water, the cement tile appear to give way sooner than the clay. We have some good reports from cement tiles, although, of course, they have not been long enough in use to show definite results. On the whole, the reports that come to us show that the clay tiles are more satisfactory.



APPLE TREES——SPECIAL OFFER
In order to reduce our large surplus of apple trees we will make the following special prices to those mentioning this paper:—

⅜ to ½ Inch Diameter, 4 to 5 feet,	$ 8.00 per C
½ to ¾ Inch Diameter, 5 to 7 feet,	12.00 " "
¾ to 1 Inch Diameter,	15.00 " "
1 to 1¼ Inch Diameter,	25.00 " "
1¼ Inch and over,	35.00 " "

These trees are all true to name and guaranteed free from injurious insects, such as San Jose Scale, etc., which have never entered our Nurseries or surfounding country. Write for our free descriptive Catalog of Fruit, Shade, Ornamental and Evergreen Trees, Shrubs, Vines and Perennial Plants. Established 1856. In the Nursery Business over half a century.
KLEHMS' NURSERIES - ARLINGTON HEIGHTS, ILL.

Your Copy of our new catalog is now ready for mailing. A practical hand book for purchasers of NURSERY STOCK.
Shall we mail it to-day? Fruit growing is a source of pleasure and profit if you use Reilly Bros. high grade trees and plants.
REILLY BROS.
Nurseries, 73 Reilly Road, DANSVILLE, N. Y.

Fruit Trees Direct from the Grower

All best varieties grown in our own nursery, so we absolutely guarantee correct varieties; free from San Jose scale; healthy, strong roots; first-class in every way. APPLE, $12 per 100; PEACH, $8 per 100—also Pear, Quince, Cherry, Plum, Small Fruits and Ornamentals direct to you at wholesale prices. We employ no agents.
Write for finely illustrated CATALOG and our Special Prices, freight prepaid. DENTON, WILLIAMS & DENTON, Wholesale Nurserymen, 130 Elm St., Dansville, N.Y.

PEAS FOR SALE
Thomas Laxton, $5; Telephono, $4.50, and Heroine, $4 per bush., in lots of two or more bushels. Cash with order. Bags free. No better quality can be had at any price. Freight to Buffalo, N. Y., is twelve cents a bushel.
P. J. Wilkinson, Cambray, Ontario, Canada

Burning Fruit Trees
There is a large percentage of every block of Fruit Trees that is offered for a few cents per tree that does not pay the Nurserymen, and does not pay the Planter. To avoid disappointment and loss to both parties we—**burn them up!** We are offering only **first-class Trees**—send for our Free illustrated descriptive Catalog, 54 pages, and see if you can't get **Fresh dug Trees** as cheap as cold storage stuff—40th year of trees from our Nurseries direct to the planter.

Office and Works, PORTLAND, CONN.

PENNSYLVANIA SPRAYING NOTES.

Like the general weather conditions of the past few seasons, the first heavy frost occurred quite late last Fall, and as a result the apple leaves were late in falling from the trees. However, a windstorm following a few such frosts finally stripped the apple trees of leaves. Then in December we had a few weeks of generally fair weather, during which time our spraying outfit was put in operation. We succeeded in spraying about 10 farm orchards, but should have sprayed twice this number in the time we were at it. A worn-out strainer on the end of the suction hose probably caused us more trouble than any one thing. As it is quite impossible to keep all the dirt out of the tank, the strainer should be in good shape. Bits of leaves, sticks, etc., will cause no end of trouble by clogging up the nozzles. Frequently a bit of dirt will get as far as the shutoff between hose and rod, and stop operations completely until the connection is taken apart and cleaned out. Keep an extra strainer on hand, as the fine brass wire soon rusts through when spraying with lime-sulphur.

Then several mornings when we were out spraying it was too cold to begin work for a few hours. One evening we failed to drain out the pump thoroughly and it took us several hours to thaw out things next morning. When there is danger of freezing the plugs should all be removed from the pump and then the engine wheel given several turns to get all the liquid out of the valves, air-chamber and pipes. The hose and extension rods should be taken apart and thoroughly drained. Then if you wish to thaw things out next morning, first put shutoffs, nozzles, etc., in hot water, and it may also be necessary to heat up the hose and rods. Then put the plugs in pump and place suction hose in a bucket or more hot water, start your engine and run this hot water through pump and hose, adding the parts till the water comes freely through the nozzles. Ice in the hose or any of the parts will cause no end of trouble till all is blown out.

There seems to be quite a difference of opinion among the farmers here as to which end of the dormant season is the better time to spray for San Jose scale. Some insist on having their spraying done in Fall, while others are just as certain that Spring spraying is more effective. As far as my practical experience has gone and comparing this with the scientific investigations of others, I am not able to perceive any difference, and I have advised the farmers accordingly. The important points are that the trees are thoroughly pruned and the leaves well off, the weather reasonably calm and not so cold that the liquid will freeze before drying on the trees, and that the liquid is thoroughly applied and of sufficient strength to kill the scale at any time during the dormant season. Advocates of Fall spraying fear that if the scale on their trees is not destroyed before Spring the insects will continue to feed on the sap during the Winter. However, it is not believed that the scale feed any in Winter at all. The various stages of the scale may be illustrated by stating that the "chicks," or those which have not reached maturity, freeze as Winter approaches, while the "pullets" remain dormant on the tree till Spring, unless they begin feeding on the sap again. Then about June the young scale, now fully matured, begin to give birth to their young; the old "hens," or those which have been active the previous season, die of old age sometime during the Winter. On the other hand there are those who believe that the scale are more easily destroyed in Spring when they begin to feed again. While this may or may not be the case I believe in making the liquid strong enough to destroy the scale at any and all times during the dormant season. My belief is that the lime-sulphur solution does its work in a few hours after it is applied. The principal reason why I advocate beginning to spray in Fall is for the reason that suitable days are generally few, and sometimes far between at any and all seasons, and when such days or parts of days occur at any time during Fall or Winter they should be taken advantage of. This applies especially to the commercial sprayer who has much spraying to do, and I may say that the man who makes a business of spraying farm orchards is becoming more popular with the farmers every year if he does good work at a reasonable charge. As a rule we have a few week's time in Spring after it gets warm enough and before the young apple leaves appear to spray almost steadily, but sometimes this season is more or less stormy, and not much spraying is accomplished after all. Hence the advice to take advantage of favorable days earlier in the season, and especially in Fall during "Indian Summer" days.

I have frequently remarked to farmers that spraying is only one requisite towards maintaining a profitable farm orchard. Pruning, fertilizing, cultivating (when needed), etc., are equally if not even more important, and if these are neglected the spraying cannot be expected to accomplish much good. But when these other things are properly attended to, then spraying may be said to be always beneficial (if properly done) while in many places spraying has become an absolute necessity if the farmer desires to have any fruit at all.

Pennsylvania. DAVID PLANK.

MASSACHUSETTS FRUIT GROWERS.

It was an enthusiastic and interested body of horticulturists that assembled in Springfield, Mass., on the occasion of the Fruit Growers' convention. The directors held a meeting before the regular sessions of the society began, at which Worcester was selected as the next place of meeting. They recommended that the association take membership in the American Pomological Society. The McKellar bill, now before Congress, was opposed in respect particularly to that section which forbids anything to remain in cold storage more than 90 days, and in so far as this had to do with fruits. President H. L. Frost of Arlington said that membership in the association had doubled the past year, and that it was now over 1,000. He emphasized the necessity of regaining the confidence of the purchasing public by giving them an honest pack which, he said, we are not doing at the present time.

Prof. M. A. Blake of New Jersey gave a practical talk on the requirements of successful peach culture, and named as the five best varieties for commercial purposes the Elberta, Carman, Belle of Georgia, Champion and Hiley, with Iola, Iron Mountain and Fox Seedling also in favor. The hardiest varieties were Greensboro, Waddell, Carman, Lola, Alton, Early Wheeler, Hiley, Bell of Georgia and others of this type. He said that the New Jersey Station gave out 30,000 buds last year that were free from disease, and they will be used to provide stock from which to propagate in the future.

Dr. N. B. Gates of Amherst discussed bees in relation to horticulture. Bees were essential, he said, to the setting of the cranberry crop, which was worth $1,000,000 to the State every year. In Ontario bees were used to get a good clover crop, and there are 100 colonies as a center every mile apart for this purpose. Fruit growers cannot depend on the wind to carry the pollen. W. M. Purrington of Haydenville spoke on the benefits of orchards to bee-keepers. He brought out the fact that it is difficult to get apple-blossom honey in the super boxes, as it all goes into the brood boxes. It comes when the Winter supply is running low and is used to stimulate the queen bees to greater activity. E. M. Nichols of Lyonsville and Prof. W. W. Chennoweth of Amherst also discussed different phases of the question as to the importance of bees to the fruit growers.

Secretary F. Howard took for his topic the necessity of coöperation between farmers and business men. The deer problem received due consideration, and that animal was found to have few friends in the convention. The deer is a trespasser and must be treated as such. Ingram I. Margeson of Westwood, described some of his experiences in fruit growing. Dr. E. Porter Felt, State entomologist of New York, gave some practical suggestions on spraying for insect pests and Dr. J. P. Stewart of State College, Pa., discussed cultural methods, cover crops and fertilization. The last day of the convention was devoted to trades people. The exhibition of horticultural appliances and of fruit attracted deserved attention and favorable comment. J. W. D.

"Did you tell pa you wanted to marry me?" "Yes, and he gave me his consent; then asked me to lend him $10."

Mitchell Little Six
$1895.00

Recognizing the fact that the modern farmer is as much of a *business man* as the merchant of the big commercial center, we call the former's attention to the *established truth* that the Mitchell car is an *investment* and in *no sense a speculation*. Not only is the car manufactured to last but its maintenance is economical—a fact that any man of business sense will thoroughly appreciate.

The principle of maximum power on minimum fuel is exemplified to a high degree in the Mitchell Models for 1914 and the strength of axles, frame, springs and other important features is calculated to resist successfully and repeatedly the severe strains and jolts and twists of rough country roads.

Such facts *must* be considered carefully to preserve an automobile as a daily utility and prevent it from becoming a costly luxury. Your Mitchell of today will be looking well and serving you faithfully several years from now and thus annually the cost of your original investment is decreased until it finally disappears.

The Mitchell Models for 1914:

The Mitchell Little Six—fifty horse-power—132-inch wheel base—36x4½ inch tires—two or five passenger capacity - - **$1,895**
The Mitchell Big Six—sixty horse-power—144-inch wheel base—37x5-inch tires—seven passenger capacity - - - - **$2,350**
The Mitchell Four—forty horse-power—four cylinders—120 inch wheel base—36x4½ inch tires—two or five passenger capacity **$1,595**

Equipment of all the Mitchell Models Included in the List Prices Here Given

Electric self-starter and generator—electric lights—electric horn—electric magnetic exploring lamp—speedometer—mohair top and dust cover—Jiffy quick-action side curtains—quick-action rain vision wind-shield—demountable rims with one extra—tungsten valves—double extra tire carriers—Bair bow holders—license plate bracket—pump, jack and complete set of tools. Prices F. O. B. Racine.

Planet Jr

No. 3 Planet Jr Hill and Drill Seeder

Sows all garden seed accurately in hills and drills. Sows in a narrow line making wheel hoe cultivation quick and easy. Sows in hills 4, 6, 8, 12 or 24 inches apart. The seed index, graduated for both hills and drills, is always in plain view.

Planet Jr Farm and Garden Implements cut down the cost of cultivation, lighten labor, and give better results. $2 to $100, according to requirement. Fully guaranteed.

FREE Our new 72-page illustrated catalogue describing 60 implements for all kinds of cultivation. Write for it today.

S L ALLEN & CO
Box 1107V Philadelphia

We carry stock in San Francisco
Agencies in all principal Pacific Coast Cities.

No. 11 Planet Jr Double Wheel Hoe, Cultivator, Plow and Rake

The greatest cultivating tool in the world for the grower of garden crops from drilled seed. The plow opens furrows for manure, seed, etc, and can be reversed for covering. The cultivating teeth are adapted for deep or shallow work and for marking out. Crops can be worked both sides at once until 20 inches high.

No. 4 Planet Jr Combined Hill and Drill Seeder, Wheel Hoe, Cultivator and Plow

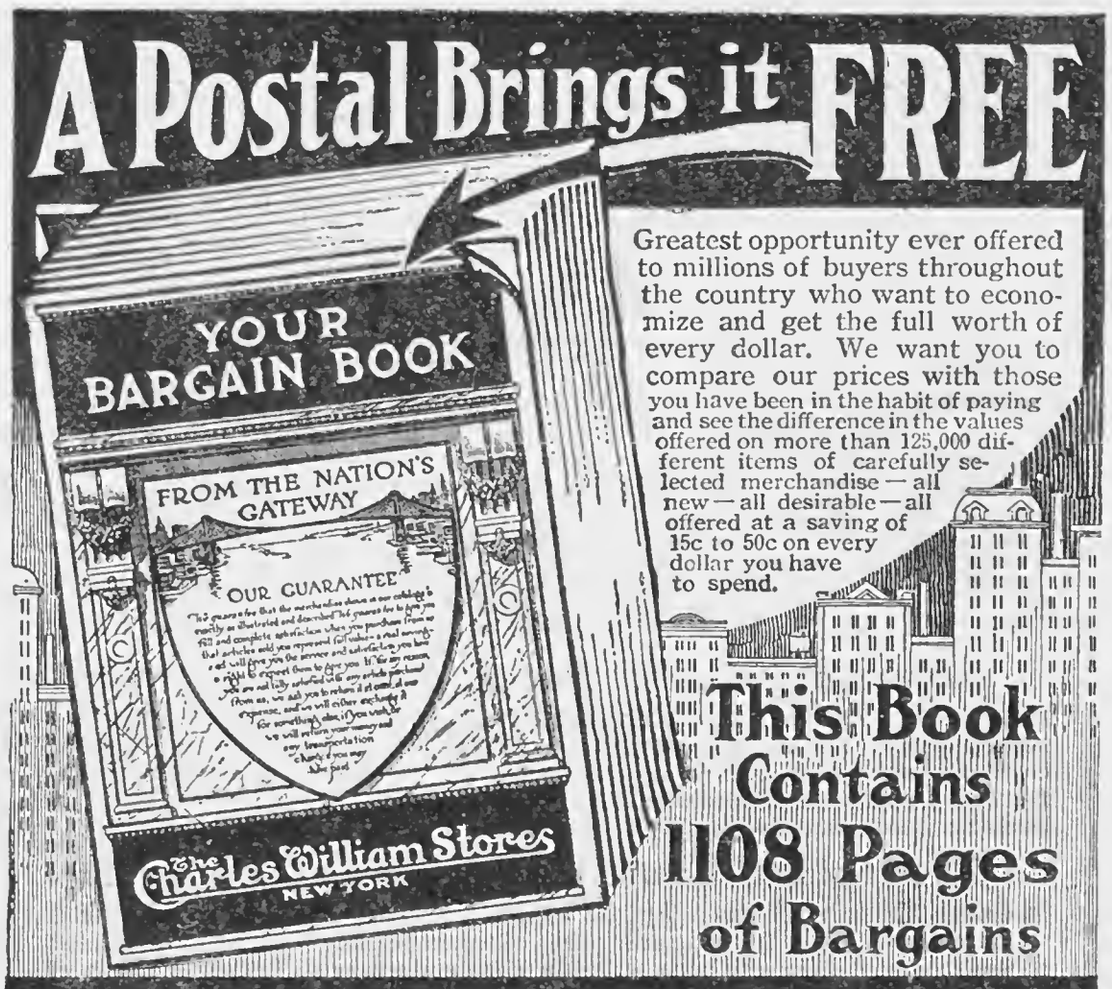
This is a practical every day time-, labor-, and money-saver for the woman in tending her vegetable garden as well as for the market-gardener. It combines in a single implement a capital seeder, an admirable single wheel hoe, furrower, wheel cultivator, and a rapid and efficient wheel garden plow. Sows all garden seeds in drills or in hills.

No. 41 Planet Jr Orchard and Universal Cultivator

The most efficient tool ever invented for cultivating vineyards, hopyards, and orchards of apple, citrus, olive and groves of orange, walnut, etc. It is equipped with fruit tree shield and side hitch for low trees. Carries teeth, sweeps, furrowers, plows, etc. Works deep or shallow and cuts from 4 to 6½ feet wide. Convertible into disc harrow and alfalfa cultivator.

Planet Jr 12-tooth Harrow, Cultivator and Pulverizer

An invaluable tool in the market-garden, truck and strawberry patches. Its 12 chisel-shaped teeth cut out all weeds, stir and mellow the soil and leave the ground in the finest condition without throwing dirt on plants. Can be set exactly to desired depth making delicate work easy.



Everything Your Family Needs

—in the home—workshop, or on the farm, can be purchased from us at an immense saving. In clothing, apparel, dress goods, underwear, millinery, shoes, furs, coats, boys' clothing and many other lines we show advanced styles at no greater cost than you would pay for inferior qualities on last season's fabrics. Everything we show has been carefully selected and cannot fail to appeal to careful buyers, both as to quality and price. We insist on giving every customer satisfaction. We, therefore, guarantee every purchase to come up to your fullest expectations no matter where you live or what you buy from THE CHARLES WILLIAM STORES.

We Pay Delivery Charges on Thousands of Items

In every possible case we give our customers the benefit of prepaid delivery, insuring rapid service. Write for "YOUR BARGAIN BOOK" C-000 today and have the advantage of buying direct from New York without paying middlemen a big profit on the things you need (3)

Don't Feed the Soil — Feed the Plant

In the top eight inches of average soil there is enough plant food in the form of nitrogen to last for 90 years, in phosphoric acid for 500 years and in potash for 1000 years.

And yet that very spot may prove barren. Plants have to take up their food in solution, in the "sap of the soil." All this food may be locked up so tightly by nature that the plants can't get at it fast enough for the commercial farmer, and he has to put in the same food in the soluble form of fertilizer.

Just so, a fertilizer may, by analysis, have all the necestary elements and yet not give the plant full value because these elements are not ready soluble.

Put into your ground a fertilizer that will feed not your already overstocked soil but your hungry *crops* with food which is available and easily absorbed.

Bowker's Fertilizers

have chemically correct elements—there is a brand to fit every need. More than that, these chemicals are blended and mixed so that they are rendered water-soluble and go into your ground in the most available form. Most crops do most of their feeding in 60 days.

Write for our illustrated catalogue, based on forty years of experience. In writing, state what your crops are.

EARLY PICKLES AND PEACHES.

1. I live in Southern New Jersey, where early pickles pay well if one can get them early enough. Part of my land lies to the south, and is a sandy loam now in Crimson clover. I have another piece, nearly level, protected on the north by woods. Which would you advise me to use? The soil is practically the same. Would you advise planting on soil not under cover crop? When should it be plowed? Would planting early peas be advisable, for instance four feet apart east and west, and afterward plant in the pickles, using peas as protection? Which would be the best fertilizer, horse manure or chicken droppings? The soil has not had any lime used on it for at least 10 years, although it grows a good crop of Crimson clover. Would you advise me to use any? I would like to know the best yielding varieties for early planting. 2. I am intending to plant 500 or 1,000 peach trees; what varieties would be the best to plant, and about how many of each? It would be necessary to ship them to Philadelphia or New York market. I would like the best for those markets. M. A. S.

Newfield, N. J.

1. I would advise the use of the land with the southern exposure for early cucumbers, as it no doubt is a warmer and earlier soil than the other plot, and by reason of the nitrogen deposited in it by the clover, and the organic matter made available for plant food by the decaying tops and roots, will be a great benefit to the cucumbers. The land should be plowed eight or 10 inches deep two or three weeks before planting time. Air-slaked lime applied broadcast at the rate of one-half or three-fourths of a ton to the acre, immediately after plowing, would no doubt prove very beneficial. On most soil devoted to the production of cucumbers, it is necessary to use manure of some kind, either broadcast or in the hill. Well-rotted barnyard manure or a good compost is considered the best, and if the supply is limited it can be made to go much further and give good results by using it in the hill. When it is so used, about two good shovelfuls to the hill should be applied and well mixed with the soil, and covered three or four inches deep. A compost of barnyard manure, hen manure, night soil, and barnyard scrapings mixed together with an equal bulk of good soil, will be found most excellent for use in the hills. This compost should be made up in the Fall and chopped and turned over two or three times during the Winter, but if through neglect or other causes it is not done, it may be made up early in the Spring, and, by cutting it down with a spade and thoroughly working it over a couple of times, it may be got into fairly good condition by the time it is needed.

I would not advise planting peas between the rows, as they will interfere to some extent with the timely and proper cultivation of the cucumbers, which should be done regularly every 10 days or so, until the spreading vines make it impossible to go through them without injury. The crop can be forwarded a week or 10 days, by either of the following methods: About the first week in May or earlier if weather conditions seem to warrant it, cut from an old pasture sods 12x12 inches and three inches thick; place these in a cold frame close together, grass side downward. With a spade cut each sod into nine squares or pieces, on each 4x4 inch piece plant three or four seeds and cover the whole one-half inch deep with some good sifted loam. Sprinkle well with a fine rose watering pot, after which put the sashes on and keep closed until the plants begin to show through the ground, which will be in three to five days. As soon as plants are up they must be supplied with air to prevent damage by over heating and damping off. The amount of air given at any given time must be governed entirely by the outside temperature. The temperature under the glass should not be much above 75 degrees at any time. The plants will have made three or four rough or true leaves in 20 to 25 days, when the small pieces of sods on which the plants are growing are to be lifted and transferred to the hills in the field, which should be prepared in advance for their reception. The plants will recuperate more quickly if the work is done in the afternoon.

The other method which is much preferred by some on account of its requiring less labor, is to plant the seed in the field in the usual way 10 or 12 days ahead of the usual time, using cheese cloth supported on wire arches as a means of excluding the cold and hastening the germination of the seed and affording protection to the young plants from the cold and insects for three weeks or so after they are up. For the arches use No. 10 galvanized wire, cut into three-foot lengths. Bend them in the shape of croquet arches, using two crossed over the center of each hill, pushing the ends of the arches about three inches into the ground, place a piece of cheese cloth over the arches large enough to lap over a couple of inches on the ground, put loose soil on the overlapping edges to hold it in place. If necessary this covering may be left over the hills until the plants reach the top of the arches. The following varieties are among the best for market: Arlington White Spine, Improved White Spine, Davis Perfect, and Cool and Crisp, all of which are about of equal value.

2. For an orchard of 1,000 peach trees the following list of varieties and number of each is recommended: 100 Mayflower, 200 Carman, 200 Elberta, 200 Mountain Rose, 200 Stump the World, 100 Wonderful. All the above are good market sorts, and should succeed well in southern New Jersey. K.

Will It Rain Again Soon?

"We'll have some more rain soon. It cleared off in the night."

"What's that got to do about it?"

"It has a lot to do about it. Didn't you ever notice that it always storms again very soon, usually within 48 hours, when it clears off in the night?"

"No, and I can't see any reason why it should."

"Well, you notice and you'll see that it does."

"All right. I'll keep a record long enough to find out if there is any difference."

That conversation took place October 22, 1913, when a rainfall had ceased and clear sky appeared in the night. I set down the date and the fact, and have kept a record for two months and a half. I was admonished by my friend to record every instance of precipitation, however small, and I learned that with the upholders of the theory in question there was no distinction between a storm and a shower that really was an aftermath of the same storm. This was not strictly scientific, but I didn't object. It was as fair one way as the other.

The first three rainfalls cleared at night and were followed by more rain in just two days in each instance. These were followed by two that cleared in the daytime. These were followed by more rain after five and four days respectively. If I had stopped then my neighbor's theory would have been sustained. The tables turned, however, and the days began to forge ahead. At the end of a month they were about even. In six weeks the days were ahead. Intervals of 13 and eight days after night clearings put the nights back almost to the distance flag, and after two months and a half, with records of 20 instances of precipitation, 12 of which cleared at night and eight in the daytime, I found the following result. The average time that elapsed after a night clearing was four days and a fraction; the average time after a day clearing was four days and a larger fraction. This does not necessarily prove that it will rain or snow again sooner after a clearing off in the daytime. It is, however, an indication that the time of clearing has nothing to do with the matter.

W. H. HUSE.

Orchard Grass for Hay.

I have been off the farm 15 years, no plowing done on it all that time. The meadows now grow a short wiry grass which the farmers call wild or Buffalo grass. I intend plowing up 20 acres this Spring, planting oats and seeding to Orchard grass, as it has a good root and stands the frost well. Does this Orchard grass make good salable hay?

Covington, Ky. F. R. M.

We would not advise you to sow Orchard grass in this field, if you expect to sell hay. The Orchard grass grows in bunchy shape and makes a light hay, which while of good quality, does not sell well in the ordinary market. The best commercial hay is a mixture of Timothy and Redtop, or with Red clover added, and our advice would be to follow the usual plan and sow Redtop and Timothy.

Raising Oats without Proper Fertilizing is Mining—Not Farming

To depend wholly upon the natural supply of plant food in the soil is neither most profitable nor most economical.

Oats take from your land more potash than phosphoric acid or nitrogen. You must supplement the supply of available soil

POTASH

by a fertilizer rich in this element, or your harvest may not pay for your labor.

Potash Pays in heavier heads, better grade, a greater proportion of grain to straw, and freedom from lodging. Balance the phosphate and nitrogen with 6 to 8 per cent. of potash.

Poor crops of oats are often due to rust. Potash gives the plants vigor to resist the rust fungus. Available potash is needed as soon as the oats germinate.

Drill in with the seed 300 to 400 pounds per acre of a 3-8-6 or 3-8-8 goods and provide the available plant food for the young plants before the soil supply becomes soluble.

This is an insurance against no crop in bad years.

The old 1-7-1 and 2-8-2 formulas are not up-to-date. They belong to the preliminary, not to the permanent, stage of profitable fertilizing.

We sell **Potash** in any quantity, from one 200-pound bag up.

THE RURAL NEW-YORKER,
333 WEST 30th ST., NEW YORK.

The Home Acre.

Beautifying the Rural Home Grounds.

The beautifying of the rural home grounds, particularly those of the farm, has been sadly neglected by the great majority of the owners of country homes. Why so many of our rural residents have been so tardy in recognizing the natural charm and beauty that can be imparted to their home surroundings, by the appropriate use of a few ornamental trees, shrubs, vines and flowering plants, might possibly be explained in the lack of knowledge as to how to do the work properly or that, in the providing of the necessities and comforts of life, they have been too busy to think of the pleasures that would accrue to themselves and families, by the expenditure of a little time and money for that purpose.

The time has come when this important feature in country life should be no longer neglected by anyone residing in his own home. Wealthy owners of large and small country estates, by the proper development of their property, and beautifying the home grounds, have set an example that should at least in a measure be emulated by all owners of rural homes, no matter how small and unpretentious the grounds may be. There are but few owners of country places who cannot do in a limited way what their more fortunate neighbors have done on a large scale.

The enhanced value of the property, the pleasures to be attained, the refining influences surrounding the home life and the restfulness and beauty expressed in the trees, shrubs, etc., that adorn the home grounds, will many times repay the small cost of the improvement. Farm papers would do well to agitate this subject energetically and not only point out the desirable and satisfying features of beautiful home surroundings, but inform their country readers, farmers and others, how to easily and cheaply attain them. I am pleased to see THE R. N.-Y. has taken up this feature of country life, and let us hope its work along that line may result in the beautifying of many country home grounds that have too long been neglected. K.

Controlling Radish Maggot.

I have seen enquiries and preventives in regard to radish maggots, and think the surest and easiest way is to scatter wood ashes (unleached) along each side of the row when radish leaves are as large as peas. It get the little bugs every time. P. P. H.

Chickweed in Garden.

I have a black muck garden, and have had three-fourths-acre of onions, but last year it was terribly infested with chickweed. Is sour soil the cause of it growing so rank, and will a good application of burnt lime help to eradicate it?
Schenectady, N. Y. W. M.

Chickweed (Stellaria media) is the most persistent and troublesome weed in the garden, and when it once gets a good hold, it is very hard indeed to get rid of it. It is not a stickler for any particular kind of soil, although it will thrive best on a rich moist and cool land, whether sweet or sour, and will be less thrifty (but plenty troublesome enough) on a light dry soil. The plant is very hardy, and thrives best in the cool, moist days of Spring and Fall, and if the Winter is open and mild such as it was last Winter and this up to January, in many sections of the country, the plant will bloom and ripen seed right along. If your soil is sour, a good coat of lime will do it good, but will not destroy the chickweed, nothing but absolutely clean cultivation will eradicate it. None must be allowed to go to seed at any time. It is a great mistake to allow the land to grow up to weeds after the onion crop is off, as some growers do. If there is not time available for keeping the land clean, it should be plowed soon as the crop is out of the way, and sown to some kind of grain. If far enough south, sow to cow peas or Soy beans quite thickly. If too far north for them, then sow to wheat or rye, at the rate of three bushels to the acre, the growing grain will soon cover the ground and in a great measure hold the weed in subjection. Plow the green crop under later in the Fall or early Spring. K.

Make Every Inch of Soil Produce the Maximum at Lowest Cost

IN ORDER to make your soil produce its maximum yield, you should supply a fertilizer "made to order" to meet your individual soil and crop conditions.

Consumers Brands for General Farm Use

comprise special distinct compositions of plant food elements for forage crops, root crops and cereals to meet just your individual soil and crop requirements. They supply just the constituents your particular soil may need for some special crop. You pay for no unnecessary plant food elements.

Early Crop Odorless Fertilizers

is prepared especially for the market garden trade for vegetables, small fruits, greenhouse and garden crops. It supplies the four plant food elements needed for these crops in soluble form, mixed in such proportions as to meet your particular soil and crop requirements. Although soluble, it is so prepared in granular form as to prevent leaching and wasting. It produces quick growth and early maturity, which means ***bigger profits.***

Holden's Special Fertilizers
For Florists and Gardeners for Greenhouse Work

These fertilizers are prepared by men who have made a life study of greenhouse fertilization in such a manner as to furnish just the plant food elements which your compost lacks. For this reason you save the cost of such plant food elements as your particular soil or crop may not require.

Mak-Gro-Odorless Plant Food

A clean, high grade, granular fertilizer for potted house plants, window boxes, flower beds, small fruits, lawns and general home garden use—made for the amateur. A splendid side line for florists operating their own stores.

Agricultural Chemical and Fertilizer Materials

We are prepared to furnish all high grade agricultural chemicals and fertilizer materials in any quantity. We make a specialty of Genuine Thomas Phosphate Powder (Basic Slag).

The Home Acre.

Will Frosted Potatoes Grow?

Are potatoes whose growth were killed by frost in September fit to use for seed? They are nice, clean, and good size.
Sullivan Co., N. Y. J. T.

The way to find out is to plant some of them. They may be frozen or only chilled. Cut a few fair sample potatoes about as you would for planting. Plant these pieces in boxes or pots, or expose them to the sun in a warm sunny room. You can tell from the way they sprout whether they will grow or not. That is the best way to find out.

Fruit Trees in Asparagus.

What would be the objection to planting a few pear and plum trees in an asparagus bed which I shall set in the Spring? Would they do much harm to the asparagus? I am limited for room, and have no other available place for trees. F. E. D.
Topsham, Me.

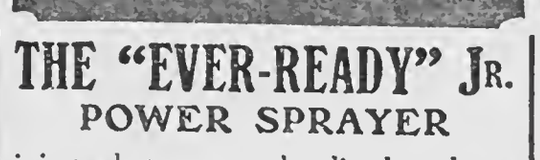
If the fruit trees were the chief consideration, and there was any other spot available for them, I would advise against planting them between asparagus, as it is rarely the trees get the proper cultivation and care when so planted. But as there is no other ground available for the trees, it is better that you plant them there than not at all. It will be quite a number of years before the trees are large enough to interfere with the asparagus, and when that time comes, the trees will (if properly treated) be so valuable you will not regret the sacrifice of any asparagus plants the trees may make necessary. Keep the asparagus far enough away from the trees, to admit of hoeing around them, so they may have an equal change with the asparagus. K.

Culture of Mushrooms.

I am growing mushrooms in boxes, in a house cellar with hot air furnace heat. The manure (without loam) was procured directly from a local florist who has successfully cultivated mushrooms in a hothouse. Of the several "successions" I have started, the following data cover the most typical of the lot and the most active boxes. These boxes measure approximately 2x2½ feet and are 10 inches high. Box 1 manure received at 120 degrees, spawned at 90 degrees; box 2 received at 101 degrees, spawned at 74 degrees. Both boxes were loamed or cased about four days after spawning, and have been watered at intervals to prevent drying out. Six weeks after spawning, white threads were running freely in one box and tiny brown heads are now coming up (interspersed with white and black toadstools), but they amount to nothing, for as they develop they show pointed tops and finally dwindle away at the base. Yet they emerge right from the spawn threads. Are the beds too moist, or not sufficiently nourished, or checked by some cause that you can bring to my attention? The average range of temperature for the cellar is 58 to 65 degrees and the last temperature taken of the beds was 55 degrees. The books warn one against too much water, while our florist urges plenty. Perhaps much water and low cellar temperature form a poor combination, though this florist in his greenhouse had a night temperature as low as 40 degrees, running up to 110 degrees in the day time. He thinks growing mushrooms in boxes is not likely to succeed and yet I have known them to come up all right in a bureau drawer!
Mount Vernon, N. Y. A. M. H.

The temperature of your cellar is all right, and mushrooms should do well there if other conditions are right, which they have not been. The French method of growing mushrooms is not altogether reliable, and should not be attempted by the inexperienced. You watered too much and covered the bed too soon with loam. The manure and loam mixture is more certain of producing, and if temperature and treatment is right there will be no question about the result being satisfactory. The manure should be procured fresh each day (it must be entirely free from litter) from a nearby stable, in quantity of about a good wheel-barrow load or more each day. To each barrow load add an equal weight of good loam preferably from old pasture field. Mix the droppings and soil each day as they are procured from the stable, turn the heap every day, until enough has been prepared to meet your requirements. The heap must be kept under cover and must not get wet. The bed should be at least three feet wide by four to six feet long, about 10 inches in depth. When all is ready, form the heap of soil and manure, cover the bottom of the box with a thin layer, and firm it well; a brick is well suited for this purpose. Then a second layer and firm as before, continuing in this wise until the box is filled to a depth of *exactly eight inches*, no more nor any less. Now plunge a thermometer into the bed to a depth of four inches; in two or three days the temperature will rise to about 100 degrees. When the temperature subsides to 90 degrees, take a sharp stick, a broom handle will do, and punch holes four inches deep, and about 12 inches apart all over the bed. Put a piece of spawn the size of an ordinary hen's egg into each of these holes, and fill the holes with the compost, so the bed will be even and firm as it was before spawning. Do nothing more with it for at least 10 days. The spawn will have run pretty well through the whole bed by that time. The bed may now be covered with about two inches of loam, which should be moderately firmed with the back of a spade. Then cover the bed to a depth of three or four inches with straw or hay. There is nothing more to be done but wait for the crop, and if the temperature and moisture is kept right, the mushrooms should begin to appear in six to seven weeks. Do not water at any time unless the top of the bed appears dry, when it should be gently sprinkled, the water being heated to a temperature of about 100 degrees.

To summarize briefly: Do not let the material heat in the making nor get wet. Fill the bed to exactly eight inches in depth. Do not spawn the bed until the temperature drops to 90 degrees. Do not put the two-inch covering of loam on the bed under 10 days after spawning. Be sure to cover them to four inches with straw or hay and lastly, do not water, unless the surface of the bed is dry, then sprinkle lightly with water heated to 100 degrees. Follow these simple rules and you will succeed. K.



THE "EVER-READY" JR.
POWER SPRAYER

is just what many orchardists have been looking for—it is just the Sprayer for the fruit grower who has not enough trees to afford a large power sprayer and too many for a hand pump. "Ever-Ready" Jr. will spray the top of a 40-foot tree without use of tower or ladder. Can be mounted on any wagon, truck, etc. Our Spray Nozzle which we furnish with this rig is a wonder.

Write us and get full information about "Ever-Ready" Jr. whether you are in the market this season or not. Prices will surprise you.

E. Frank Coe Fertilizers

1857 THE BUSINESS FARMERS' STANDARD FOR OVER FIFTY-FIVE YEARS 1913

Do You Raise 300 Bushels of Potatoes per Acre?

THREE hundred bushels per acre is not an unusual yield by any means, but did you get it this year?

¶If you were planning to raise 300 bushels of potatoes to the acre how far apart would you space your rows? How far apart would you drop the seed pieces in the row?

¶How much fertilizer would you use to grow 300 bushels of potatoes per acre? How would you apply it?

¶Are you sure that your seed potatoes are true to name and true to type?

¶What are you doing to prevent "scab" and early and late blight?

¶Did you have a short crop of potatoes because of dry weather? Have you decided how you will overcome this trouble in the future?

¶All these practical points, and many more, are fully covered in our new book

"Potatoes: A Money Crop"

which will be sent free to every potato grower who requests a copy, and mentions this paper.

¶This book is written by a man who himself has had years of experience as a potato grower, and who has made a careful study of the best methods of other growers.

¶If you read this book you will keep it for future reference. It is a "worth while" publication.

Hope Farm Notes

Four years ago I bought from a certain nursery some Elberta peach and Baldwin apple trees. The peach trees proved true to name, while the apples are of a sweet variety. There were full-grown trees of sweet apples on the piece of land, for which I bought these trees, but as they were of no value to me except for pig or poultry food, I chopped them down to replant them with Baldwins; now after spending money, labor and time, I find that I have again sweet apples only of a different variety. The nursery to whom I send some of these apples pronounced them a Grimes Golden, while our agricultural college, to whom I also sent a package, name them as a Tolman Sweet. I have tried to dispose of the apples, but as I expected, could do nothing with them. These trees are on the best piece of land on my farm, as the ground is constantly heavily covered with poultry. It has been my intention to dig out these trees and try again for Baldwins, but a friend has advised me to graft them to Baldwins instead. What would you advise me on the matter? F. M. LINSLER.

Massachusetts.

From our experience here I would have these trees grafted to Baldwin. Unless you know how to do this work well you would far better employ some expert grafter. He will know how to shape these trees properly and he can make sure of his scions. This stock may not prove the best for Baldwin, but we should try it. You have a taste of the bitter pill which nurserymen hand out in a "misfit" tree. When you want standard apples like Baldwin the sweeter the fruit they do send you the worse the dose you must swallow. Personally we have had but few misfits. Many small orders that we have noticed turned out to be the most outrageous mixtures that the human mind could well consider.

Do you think it advisable for a man 65 years old to set out fruit trees next Spring, with the idea of getting any benefit for himself, say apples, peaches, plums, etc., where he obliged to hire them set out? I work in the shop now, but bought a small piece of land with the intention of living on it in two or three years. L. F. H.

Massachusetts.

This is the problem which comes up to many a man in late middle life. Personally I intend to keep on planting trees year after year—if I live to be 100. A man of 65 in reasonably good health may well expect to live to obtain fruit from peach and plum, and from such apples as Wealthy, McIntosh, Transparent or Black Ben. With such as Baldwin or Spy he might not live to see large crops, but there is another and better value for him than the sale of the fruit. If such a man can come to enjoy seeing the trees grow and to love them as the true fruit grower does he will find this the most beautiful part of life and his later years will pass gently on into a serene and hopeful old age. I have seen many old men who were never taught during their youth to love trees, and who had no time to learn during their busy life. When age took away the old forms of interest and enjoyment they had nothing to interest them. The care of a young orchard might have made their declining years the golden age of life. I would by all means plant the trees and spend as much time as possible in their care.

I have a small farm and am buying tools. I would like to make one harrow do all purposes. Considering a peg-tooth with tilting teeth, a spring tooth, an ordinary disk, a "cutaway" disk, which one of the above would you recommend, or should I need two kinds? F. E. W.

I think every farm should if possible carry two distinct types of harrow—one to rip up or dig, the other to level and smooth. A digging or turning harrow following the plow will loosen the soil and help fit it. Then the smoothing harrow should follow and prepare the seed bed. The peg-tooth harrow is good for fitting the surface. I have seen land well fitted by plowing and then smoothing down with peg-tooth, but even in such cases the soil would be better for a deep stirring before the smoothing harrow was used. For stony ground—especially where the stones are round—the spring-tooth is best. This digs and jerks through the soil, ripping and tearing the furrows apart and dodging around the stones. For smoothing land we like the cutaway better. It digs deeper and throws or tosses up the soil better than the spring-tooth. If limited to one harrow I would take the peg-tooth.

I have just bought a Jersey cow and calf about five weeks old. I shall have to buy all my feed for both cow and calf. Will you advise what you would buy, how much to feed, when feed and how feed to both? T. B. S.

Millington, N. J.

We are feeding two cows and a yearling heifer this Winter. For roughage they have dry cornstalks—a flint variety with slender stalks. They each have a peck or more of chopped mangels per day. For grain, we mix equal parts of wheat bran, middlings and cornmeal with a good handful of linseed or cottonseed meal. The general rule is to feed one pound of grain for each two pounds of milk. This is very cheap wintering, as the stalks are practically a waste product. If I were buying I should try to obtain some dry stalks of good quality and also hay containing as much clover or Alfalfa as possible. For best economy the stalks may be cut up and steamed by putting them in a barrel and pouring in hot water. For the grain of one cow I think our mixture would answer. For the calf I should buy one of the prepared milk substitutes and feed it according to directions with skim-milk, and keep a little box of bran and oats before the calf. Mind you, this is for one calf only—not for a large herd.

My land needs lime, potash and acid phosphate. Will it be all right if I mix all three together, spread on plowed ground and harrow it in? E. R. H.

Maine.

No, do not mix the lime with potash and phosphate. Far better spread the lime after plowing and harrow in, and then use the potash and phosphate separately. The action of the lime is much like a medicine for the soil, while the potash and phosphate represent food. There is no good reason for mixing them.

Will you ask the Hope Farm man what he knows about the following clipping, especially the mouse story?

"A mouse, as timid as the rest of his kind, went frisking around a cellar and came to a pool made by a leak from a whiskey barrel. He drank a little from the pool and went away. Then he came back and drank a little more. He came back and forth a half dozen times. The last time he reared up on his haunches, and said: "Now show me that cat."—Exchange." G. A. M.

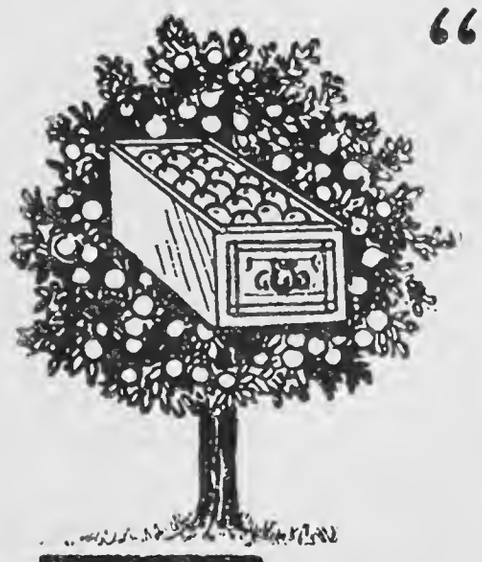
Michigan.

From actual experience I know nothing about the condition in which this mouse found himself. A whiskey exaltation may be a glorious thing while it lasts, but it is mighty humiliating when it passes and the victim realizes what a fool he has made of himself. I worked in a printing office once with a little sniff of a man who was jealous of a big fellow. One day this little man came to me in about the condition of this mouse. "Oh!" he said, "If I only had that big brute here I'd take him out and wipe the sidewalk with him!" There was a lot more to it, but the next day he came back and said, "Be careful not to let Frank know what I said—he might think I was talking instead of the whiskey!" I find the world well filled with blowhards who are like this mouse. It is not always whiskey, but often the gas of their own conceit which gets into their heads. While the spell is on they are going to do wonderful things. Sometimes it is a back-to-the-lander going to show "these old farmers" how to do it. Sometimes it is a fresh young hired man, or clerk or college graduate who has lapped at the spring of conceit and wants to see "that cat." The cat is named experience, and after she has put a few claws into the mouse—it is either a very much wiser and better mouse, or "there ain't no mouse." H. W. C.

Labels on Nursery Trees.

In my comments on desirable nursery tree legislation on page 47, inadvertantly I said we want these identifying labels on every nursery tree sold in the State of New York. I meant that every tree should bear means of such identification, for which the labeling of each bundle would be quite sufficient. I hasten to correct this because the original bill did provide for a label on every tree—an unnecessary burden eliminated at the suggestion of the legislative committee of N. Y. S. F. A. DATUS C. SMITH.

The label on each bundle is enough. That should be accepted as identifying the variety. We should not ask or expect impossible conditions. Yet the buyer and planter has certain rights, and there is no reason why he should suffer all the loss in case of a nurseryman's blunder.



"I'll Grow Apples Instead of Hay"

---You'll Say It If You Try to Buy Fruit Now in City Markets

For clean apples of good size you've got to pay 75 cents a dozen in city retail grocery stores. This has been the price since about the first of January. It is six and a half cents each, or about $4.50 a bushel box. Stayman, Baldwin and other standard varieties are all the same price.

If you are a farmer why not get some of this money? Ten acres of apples are good for a thousand dollars a year clear profit if you just give the trees modern care. A good ten-acre crop that had been sprayed right could be sold to-day at wholesale for three or four thousand dollars.

To plant ten acres of apples costs something like this: Land (highest), $1,000; trees and planting, $375; cultivation and care for five years, $600; total, less than $2,000. This included big wages for you. If you do the work the cash outlay need not be more than $300.

THE APPLE CROP IS THE PROFIT CROP. A woman who owns a half interest in a New York farm told the writer that the apple crop on their place gave them nearly all their profit. When the apple crop is good they have a dividend. When it is short that year's net income is slim. They do not use the best methods either. There are hundreds of farms where this is true. The apple crop is the money crop, the profit crop. No other crop that New England or New York or Pennsylvania farmers grow equals it in this respect.

THE APPLE GROWERS ARE THE PROSPEROUS FARMERS. Go where you will, this fact strikes the careful observer. A twenty-acre apple orchard that is handled properly nearly always brings more income han a 200-acre farm given to raising hay, grain and stock. Couldn't you get a bigger income with easier work by planting an apple orchard? What's the use of killing yourself farming a hundred acres for a bare living when you can become prosperous by caring for twenty acres of apples? Better let your surplus land lie idle and grow apples on the few acres.

PROPERLY GROWN APPLE TREES BEAR IN FIVE YEARS. It used to be that apple trees didn't begin to bear till they were ten or twelve years old. This is one more of the old and needless obstacles to orcharding that modern methods have overcome. Get good trees, plant and care for them as we tell you, and they will give you apples in five years or less time. The right kind of trees and care don't cost more than poor trees and inefficient care.

WHAT VARIETIES SHOULD YOU PLANT? The good old Baldwin never has been surpassed for most New York conditions. It sells splendidly when grown in the northern climate, because of its distinctive flavor and high color. Plant Baldwin—it never will lose its popularity. Other apples that ***Now Are Yielding High Profits*** in New York and New England are Stayman, Rome Beauty, Ben Davis, Gano, Wealthy, Yellow Transparent, McIntosh and Stark. An orchard made up of three or four of these varieties is sure to yield good profits if it receives good care. Rome Beauty, Stark and Gano are in great demand for baking in restaurants and homes. They hold their shape when baked. This use of apples has increased a thousand per cent. in three years, and it will continue to increase.

THE OVERPRODUCTION BUGABOO. "Apple planting is overdone." "There's too many new orchards planted." Expressions like these are heard now and then from pessimists. Right in the face of their predictions the prices of apples keep climbing higher and higher, and the demand gets greater. There never will be too many apples of good varieties when they are grown clean and flawless. Of course many young orchards planted during the last few years will fail to return profits expected—but that's just because they lacked proper care. *You* don't need to be one of the careless planters.

Few Other Apple Trees Equal Those We Grow Here At Berlin

Harrison's Berlin-grown trees are superior to those grown where climate, soil and methods are not so good. This can be proved by comparing our trees with other trees, and by comparing the growth and crops made by our trees with the growth and crops made by other trees. These Harrison trees are adapted perfectly for Northern sections.

HARRISON TREES ARE BIGGER THAN MOST OTHERS. Compare an average bunch of our trees with an average bunch of trees of same age from an inland nursery. Ten to one our trees will be a third taller and a fifth to a third thicker in trunks.

HARRISON TREES ARE SMOOTHER AND STRAIGHTER. Compare the trunks of our trees with the trunks of inland-grown trees, and with trees grown under other systems of culture and pruning. Our trees will be smoother and free from knots and bumps. They will be straight and true in trunks. The bark will be healthy and clean. Such trees make better-looking orchards and are not likely to split down or lean as crooked, knotty trees.

HARRISON TREES HAVE BIGGER ROOT SYSTEMS. Carefully dig out one of our trees and a tree from an inland nursery. Our tree will have a much larger bunch of roots, and roots that are finer and more fibrous. This is because of our loose, warm soil, and our special system of cultivation. Our trees will take hold quicker and stronger when transplanted, and will grow faster than most other trees.

HARRISON TREES ARE ABSOLUTELY HARDY IN THE NORTH. Tens of thousands of them are planted in New Brunswick, Ontario, Nova Scotia, New England and New York. They are entirely successful and hardy in those sections.

The reason is that Harrisons' Nurseries are located close to the Atlantic Ocean. Our trees are subjected to all the fury and cold of the Atlantic gales, and are tempered by the storms.

HARRISON TREES ARE BUDDED FROM BEARING ORCHARDS. A few years ago we began to bud our fruit trees from bearing orchards selected for superior growth and yielding. This gives our young trees inbred tendencies to bear earlier, more regularly and heavier than average trees. This parentage, plus our climate, soil and methods, gives the ability to bear bigger crops.

SPECIAL LOW-HEADED TWO-YEAR TREES. We have pruned and trained several thousand Baldwin and other apple trees to special low heads just as they should be in orchards. These trees now are two years old. They are big and straight and of the highest Harrison quality. They will make fine orchards quickly. If interested in them, write and ask about them.

WE GROW AT BERLIN ALL THE TREES WE SELL. Every fruit tree that leaves Berlin has been propagated and grown here. We buy no fruit trees at wholesale and sell them again at retail. We back our trees till they bear, because we know all about them from the seed and the bud.

PEACH AND PEAR TREES MUST NOT BE OVERLOOKED. You will find them here by the million, and just as fine ones as the apple trees. Kieffer Pear trees this year are especially fine, and Kieffer is as great a money maker as ever in New Jersey and New York. Ray, Crawford's Late, Elberta and other peach trees, the like of which you can't find elsewhere, await your order here.

THE HARRISON NURSERIES ARE THE BEST EQUIPPED IN THE COUNTRY. We employ more skilled men than any other nursery in America. Some of the greatest nursery and fruit experts in the country are on our payroll. Harrisons' Nurseries have more acres in young fruit trees and plants than any other nursery in the country. Here trees are grown with maximum efficiency and at lowest cost, quality considered.

Get the Harrison Books for 1914

This year's catalog is one of the best fruit books published. It gives the facts about varieties, tells how to plant, and quotes our famous low prices. It is sent on request. Write TO-DAY for your copy.

Our shade tree and evergreen book is sent free. If you are interested in home planting, write for a copy. Our complete guide book for orchardists, "How to Grow and Market Fruit," is sent for 50 cents, and that amount rebated when you send us a $5 order.

HARRISONS' NURSERIES, Box 494, Berlin, Md.

Why not come to Berlin this Spring and pick your trees from the nursery fields? Come and see our orchards. We will pay your hotel bill in Berlin.

USE THIS COUPON—IT'S AS GOOD AS A LETTER

HARRISONS' NURSERIES, BERLIN, MD.

Please send me your new Catalogue of Fruit and Ornamental Trees. I expect to plant

☐ Apples ☐ Cherries ☐ Shade Trees ☐ Roses

☐ Peaches ☐ Plums ☐ Evergreens ☐ Hedge Plants

☐ Pears ☐ Small Fruits ☐ Shrubs ☐ Vines

I shall need about.....of the plants marked.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

IT seems that there are various things sold as "agricultural lime." It is generally understood to be ground limestone, but in some cases the dealers seem to scrape up the waste around the limekilns. This contains some ground limestone or lime dust, and also some burnt lime. Some of our readers are being told that this "agricultural lime" can be safely used in the stable or in the manure pile to hold the liquids and ammonia. As we have pointed out, the raw lime or marble dust will make a fair absorbent without any great chemical action to set free the ammonia. The burnt lime, on the other hand, acts to set free ammonia, so that it will be lost. Land plaster is a much safer material to use in the stables than "agricultural lime." We think it a safe rule not to use this lime for absorbing the liquids. Certainly not without making sure that it contains nothing besides ground limestone.

*

THE Supreme Court has decided in favor of the California fruit shippers in the famous refrigeration suits. These fruit shippers had a method of precooling or icing car loads of fruit. When thus cooled, the railroads moved them. On each car shipped across the continent, there was a saving of about $54. The railroads took this privilege away from the shippers and charged the extra money for the service which the fruit growers could do cheaper themselves. On complaint by the shippers, the Interstate Commerce Commission ordered the railroads to do this service at what it cost the fruit growers themselves; that is, the railroads were ordered to cut down their charges $54 a car or give the shipper the old privilege of doing his own icing. The railroads fought the order and carried it up to the Supreme Court, which has now sustained the Commission. It is stated that about 20,000 carloads of fruit a year will be covered by this order, and this means a saving of one million dollars to the California fruit growers.

*

LAST week "Mapes the hen man" came back with the figures showing his "contest" between an average of 11 cows and 1,800 hens. He makes a great showing in favor of the hens, but there are some other things to be considered. What about the capital invested? The 11 cows may be worth $1,000. We doubt if Mapes would sell his hens for $3,000. The hen houses are worth more than the barn in which these cows are kept. Probably four times as much money is invested in the hens as in the cows. Of course a cow investment includes far more land than the hens would require. In further explanation of his figures Mapes says:

> Egg production is a business for men of some capital, as well as milk production. A farmer's own two hands should be the unit from which to deduct his calculations.

But does Mapes claim that 11 cows cover the full "two hands" unit in the dairy business? Before he can do that he should have all his dairy arrangements as efficient as those he has provided for the hens. A milking machine, a silo and carriers run by gas or electric power—all these are in use on some dairies. We expect to hear from men who handle at least 20 cows and sell certified milk. But Mapes certainly gives us a chance to figure.

Corn from Argentina is apparently to be a regular feature in the markets of our Eastern States. Since last Fall something more than 9,000,000 bushels have arrived at New York. The distance shipped is about 4,700 miles, yet the importers were able to handle this Argentine corn profitably and meet or undersell our home-grown product at New York. As the season in Argentina is opposite ours, the new crop is just developing there, and, with the exception of some drought damage, indications are that the yield will be good. A decided improvement in the market quality of our corn is necessary for successful competition with the foreign crop. There must be less Nos. 4 and 5 and more Nos. 1 and 2. The dry kiln will prevent musty corn from rotting, but cannot undo previous damage. Many growers a· raising varieties attractive as yielders, but requiring too long season to be reasonably safe in their latitude. Sound corn is a scarce article in our markets.

*

IN one way this "back-to-the-land" proposition has proved a fine thing for farming. Many well-to-do and prominent men have bought farms and started to conduct them. When they began they were very strong for the "two blades of grass" theory. They expected to produce large crops and then make large sales. Some of them have been able to grow fair crops, but at a fearful cost of fertilizers and labor, so that the expense per pound or bushel is very heavy. When they came to sell these crops they learned their real lesson in agriculture. Living in the city these men know what consumers paid for food and a little figuring showed them that they were receiving a 35-cent dollar for what they paid ont 50 cents to produce! They would not believe this until they had to pay this 15 cents or more difference. "Once I was blind—now I see!" This practical demonstration of the 35-cent dollar is very largely responsible for the change of sentiment in many of our public men. Lawyers, merchants and manufacturers did not grasp the significance of this clipped farmers' dollar until they turned farmers and felt the shears on their own coin. Then they woke up and began to see how the 35-cent dollar not only affects their own personal farming business, but also their other business. For every five cents which is added to the farmer's dollar makes five cents more to buy some article or some service which these men have to offer. Many a university graduate is now going to school to the 35-cent dollar and adding to his education.

*

HERE are extracts from two letters which pleased us greatly. This season brings many pleasant words of encouragement from our readers—we never had so many before. These two letters somehow come to the top as the cream of good feeling and service:

> I have been a subscriber since 1869, 44 years, and although I have been blind for several years from cataract and have not been able to read or write a word for over three years, THE R. N.-Y. habit has become so fixed that I must continue it. I expect my sight will soon be restored by an operation and then I shall have a literary feast in looking over the numbers for the last three years. L. W. GOODELL.
> Massachusetts.

Our hope and prayer is that this patient and cheerful blind man may receive his sight. Such a thing makes us regret that we could not have put more of brightness and truth into the paper that it might be indeed a "literary feast" when the light once more breaks into the brain of our old friend.

Here is the other letter, which may well be read with the first one:

> I am very much interested in farming and would like very much to take a course in a first-class college, but as I have neither the time nor money I have discovered a very good substitute and it only costs $1 a car for tuition, pretty cheap isn't it? In fact it is too good to keep to myself so I am sending it to you so that it may be sown broadcast. My course of study is to read THE R. N.-Y. from beginning to end and whenever I come to a problem I always read the problem and then lay the paper aside and study the same and try to give a satisfactory answer, and then I compare my answer with the answer in THE R. N.-Y. to see how near right I am, and then I try to reason how THE R. N.-Y. secured its answer. I have found that by following the above course I am gaining a good practical knowledge of farming which I expect to put to use one of these days. A. J. Z.
> Pennsylvania.

This does us good, for it makes us realize how strong and serious minds are analyzing and weighing what our writers have to say. We cannot think of any mental exercise better than this idea of thinking out the problems given in THE R. N.-Y. proving or disproving the printed solutions. For during the course of a year such problems will cover a range of human thought as applied to country life and its future. Out of such study and thought will come the foundation of a deep and broad culture—the true essential of education.

SOME of our readers have heard that the U. S. Supreme Court has decided that it is unconstitutional for a State or city to collect a license fee for the sale of goods! We have had this carefully searched and find no such decision. Some of the reports of legal decisions which go floating through the papers turn out to be fancy tales. We have stated many times that farmers are free to sell the products of their farms on any public highway provided they do not interfere with travel. When they handle products which they do not grow they are classed as peddlers, and are subject to a license.

*

THE latest report is that the Agricultural Department is working with the postoffice to use parcel post to cut the cost of living. A number of containers for eggs, butter, and other farm products have been devised, so as to make it possible to ship these goods in satisfactory packages. Thus far, shipments of eggs have not been satisfactory. The breakage has been too heavy. There has also been much discontent regarding shipments of butter. It is now claimed that containers cheap and durable have been devised for handling these products. The Agricultural Department, after settling this matter of packages, will begin to find markets for standard farm products. For this purpose, the rural carriers and the machinery of the whole Post Office Department, will be employed. Both departments, as well as all who have studied the matter, know that the greatest trouble comes from a lack of standardizing farm products. Before anything like an effective service can be built up, there must be a uniform standard of goods sent from the farm. People in the cities and towns must know just what they are buying, and what they are to receive by parcel post. As soon as farm products can be bought and sold by a definite standard, the parcel post trade is sure to develop wonderfully, and will in time, without question, have a distinct effect upon cheapening the price of food, but no great progress can be made until the purchaser can be absolutely assured about the quality of goods he is to receive when he buys. One of the most important things therefore, connected with this enlarging of the 35-cent dollar, is to establish a definite standard, by which food may be bought and sold, and then to organize so that these standards may be definitely maintained.

*

A NEW era has been inaugurated at Albany. Last week, after the Agricultural Convention, Governor Glynn opened wide the doors of the Executive Chamber and invited representative farmers to enter and discuss with him the needs of agriculture. They did so fully and without reserve. The discussions were neither personal nor academic. They embraced comprehensive policies and fundamental principles. It was an effort to develop a system of organized self-help; a system of coöperation, by which the producers of wealth may control and retain for themselves the full value of the wealth they create. The significant thing about it was that the men were not speaking so much for themselves as for their neighbors. The men there did not need personal credit for themselves. They carry bank accounts and have ample bank credit. They do not need a land bank. Their farms are free from mortgages. They would profit by a modern market system but they have made the most of the market facilities they now have. They were successful, prosperous farmers, seeking means to better the conditions of farmers less fortunate than themselves. There may have been men there who came doubting, and others who left not realizing the full significance of the sentiment they had created, but few men could be there without catching something of the altruism of the hour, and no man could realize the spirit of the occasion and not go away a better man than he came. They gave of themselves and went away enriched by their own generosity. It was a day of encouragement and hope to humanity. There may be those who will say this conference was inspired by politics, but if this be politics, for pity's sake let us have more of it.

BREVITIES.

TIME to think about the Spring grafting.

THESE are, or ought to be, woodpile days.

PRICE Co., Wis., is said to be practically free from tuberculosis.

A TABLE-CLOTH worth $6,500 was the subject of a recent legal suit in New York.

DRAIN the concrete cellar if there is danger of wet in Spring. Let tile take the moisture away.

WE have never used a manure spreader to put the mulch on strawberries, but it has been done successfully in this way.

NOW Kansas intends to increase her yearly poultry value by $10,000,000. This means better blood and something besides corn.

CO-OPERATIVE STATE MARKETS.

[Report of marketing committee of the New York State Agricultural Society by John J. Dillon, Chairman.]

NEW YORK MARKETS.—Your committee has given much attention to the subject of market conditions in New York City. Conditions there could hardly be more extravagant or wasteful if they were maliciously designed. There is no provision there that could properly be called a market. The city owns some lots of land with antiquated buildings, in which it rents out stalls for the sale of food products, just as any other landlord might do, at a more profitable rental, but there is no regulation for the protecting of either producer or consumer who patronize them. Perishable food products are rushed to that centre by rail, steamer and boat, and now by auto express. It is left to the tender mercies of transportation employees; to truckmen; to commission men, to jobbers; to speculators, and to retailers. There is no provision to care for the damaged, the neglected, or the surplus shipments. As a result complaints from shippers are numerous. Total losses are frequent, and the producers who get a prompt return for 35% of the consumption price, are always fortunate and sometimes content. At the time of the organization of this committee a project was under way to spend twelve million dollars of city money to establish a large market structure near the present site of West Washington Market. This did not meet the needs of the city, and could only perpetuate and magnify the present unsatisfactory conditions. A protest was made against the project by this Committee and the Housewives' League and it has been since held in abeyance. A committee is now at work on a comprehensive plan for a series of markets to be under municipal control and regulation; and it is hoped that measures along these lines may be perfected and adopted.

THE FARMER'S PROBLEM.—The marketing of farm products is essentially the problem of the farmer. He cannot safely entrust it to others. So long as middlemen monopolize it, it will be at the expense of producer and consumer. If the municipalities should undertake it, it would naturally be conducted for the benefit of the consumer. So far in this State the middlemen have practically had a free hand. There has been little or no organized attempt even to supply local markets, and the individual farmer cannot give a satisfactory service to local dealers or local consumers. Hence we see fresh farm produce shipped from interior towns to large cities, there repacked and shipped back again in definite quantities to the country towns. The produce has deteriorated in value and the expense of two transportation charges and one or more dealers' profit must be paid by the local dealer, and the consumer pays an extra profit for the privilege of getting the exact quantity he demands.

POOR SALESMANSHIP.—But the products of the neighboring farms are not always returned from the metropolitan markets to local towns. In many lines this trade has been secured by the better systems of salesmanship adopted by other States. Go through the small towns of New York during the producing season and you will seldom find on the hotel tables or in the markets of the towns the fresh products of the neighboring farms, but you will almost invariably find California fruits and bananas. We grow in New York State some of the finest quality apples in the world, but we leave the packing and the sale of them to such an extent to speculators and jobbers that, as a distinct food, New York apples are unknown to the consuming public. This condition is so general that it is beyond the control or correction of the average individual grower. Last year a Columbia County, N. Y., grower went to the city with a shipment of finely sorted and graded Baldwin apples. He was unable to sell them at any better price to the jobbers than if he mixed the ordinary grades in his barrels. He was told that there was no recognition of his superior apples in the market, and that they would sell for no more than the ordinary pack. Go into the hotels and restaurants in New York City and into the dining cars of most of the railroads of the country and ask for baked apples and you will get a western product. Demand an explanation and you will be told that the steward was unable to get a uniform grade of New York apples. The organizations of the West have simply gone about the sale of their products in a business way, and by superior salesmanship have secured a preference for an inferior article in your own markets. Our flocks have vanished from our Eastern hillsides, and our fields and feed-stalls have given up their meat-producing animals to the pressure of the monopoly of our markets, and the coercion of our butchers by the meat packers of the West. With subtle irony these packers now complain that the Eastern farmer has abandoned the production of meat producing animals. The conditions are right now for the revival of this industry, but if we give ourselves exclusively to the production of it, the packers will again find a way to appropriate its profits to themselves.

WE MUST MAKE TRADITIONS.—We must begin at the beginning. We must establish marketable packages and brands that will specify in quality and quantity of weight or measure, the exact contents of the package, and that will be accepted without question at its face value in the markets of the world. Generally speaking local markets are the best markets. We are fortunate in having many of them in New York State. We should develop them and control them by the simple process of giving better service and better and cheaper food than can be secured elsewhere. The individual farmer cannot do this because he cannot furnish a steady supply. It must be done by assembling the food products of the neighboring farms in a common market or warehouse and supplying the local trade from this centre. To effect this the local growers should be organized in coöperative societies with packing and shipping facilities, and in some sections with cold storage and manufacturing plants to take care of surplus products. These local units or societies could be coördinated in one central agency with representatives in the large markets of the country to direct the shipment of food products not absorbed by local trade where they would find the most ready demand and the best prices.

FARMERS' ORGANIZATIONS.—In proposing this organized work we are invariably met with the assertion that it cannot be done because farmers will not, they assert, stand together. I meet this criticism with the answer that farmers are in this respect no different from any other class of business men. Gentlemen's agreements have never yet produced permanent results. I have seen it tried by farmers, by brickmakers, by clothiers, by grocers, by barbers and by publishers, but the gentlemen's agreements were never adhered to for long by all of the parties to it until the interests were bound together in a legal contract that none of them could violate except at his peril. The farmer cannot play hide and seek with a coöperative company and expect satisfactory results from it. He must enter into contractual relations with his own company just as he would with any other company, and he must bind himself to live up to that contract in all its details just as he would with any other contract. If a creamery company organizes to handle the milk of 400 cows and half of the members are led to withdraw because some milk dealer is interested in the destruction of the company and offers individual members an eighth of a cent premium for their milk, the creamery cannot be maintained at half its capacity, and unless the producer is willing to become a member and bind himself for a definite time in a definite contract, he does not become a member of the association and is not entitled to its privileges or benefits.

BUSINESS PRINCIPLES ESSENTIAL.—To be successful, coöperative organizations must have legal organization and be operated on strictly business lines. They must be independent and self-supporting. There is also danger in loose or careless organization. There is no magic in coöperation work. The associations will not produce miracles. They are not Aladdin lamps that will produce fabulous wealth by the friction of a chamois cloth. They offer opportunity for organized self-help. Through them producers may save waste and preserve for themselves the profits that now go to middlemen. Cooperation looks for no subsidy from the State; and would accept none. It does not expect something for nothing. Statutes, however, will not create coöperative organizations. The farmer does not have the time nor the experience, nor in all cases the information and the facilities for organization work. It is, however, important to the whole consuming population of the State that facilities be provided for the saving of products now going to waste, and for the economic distribution of all farm food products. Hence it is the proper function for the State to help organize food distributing associations as part of the agricultural educational work of the State. It will require men trained in the principles of coöperation and business to discuss the plans and purposes and benefits of the organization with producers throughout the State, and to organize these coöperative associations, and help direct and develop the business.

A STATE COMMISSION.—The opinions of producers and consumers are fast crystallizing into the conviction that we should have a State agency clothed with the authority and charged with the duty of organizing producers in local units; and of establishing and maintaining markets and slaughter houses; assembling food products, and prescribing packages, grades and measures, and of inspecting foods and regulating their sale and distribution; of preserving surplus, developing local markets and directing shipments to centres of greatest demand. I grant that a perfunctory commission would be worse than useless, but the possibilities of the work are vast and enduring enough to fire the ambition and to inspire the energy of genius; and the man or the administration that undertakes it and measures up to its opportunities, will merit the everlasting gratitude of future generations. This is a departure that is coming sometime. That thousands of people should go hungry in the city while food is rotting on the nearby farms, is a disgrace to our boasted civilization, and an insult to a bountiful Providence. It is impossible that we should be permitted to abuse the generosities of God indefinitely. The calamity howlers already capitalize our negligence to promote their own vague and sinister theories. They find willing listeners in homeless men, ill-clad women and hungry children. No one defends our present system of distribution, and nothing stands between us and ultimate chaos or anarchy but a fair distribution of wealth through the coöperative control of the men and women who produce it.

SAVING THE WASTE.—While food products were abnormally low the consumer was little concerned about the extravagance and waste in the distribution of farm food products. At worst the price to the consumer was no hardship. The farmer accepted the inevitable of his 35-cent dollar; the middleman took his 65 cents and all were happy, but when the cost of living began to advance the consumer began to feel the burden, and investigation has revealed the fact that of the estimated $500,000,000 worth of food products consumed in the city of New York alone, the people of that city are paying more than three hundred million dollars annually for distribution. This does not take into account the losses and waste of deterioration and condemned products in the city. Nor does it include in any way the waste through losses and expense of returning products to inland towns. Nor through the waste of products that rot on the farms because the producer is unable to secure enough for them in the markets to pay for packing and transportation.

Our concern is to save this waste. Economists have pointed out to us the possible shortage of food in this country if present ratios of production and increase shall continue for 25 years, and they have warned us that unless changes are effected it will become necessary in the next quarter of a century to import food to feed the people. They calculate on the basis of our present system of distribution. They have not guessed the possibility of the production of American farms under a system that would return the farmer a fair reward for his labor. The farms of this country produce three-fourths of the annual wealth of the country. The idlers and non-producers manage to get possession of the surplus savings. The workers produce; the idlers and non-producers save. This saving we call capital, and the producer must go hat in hand pleading to the non-producer for the use of it. We are trying to devise a system by which this saving or capital will remain in the hands of the men who produce. If we are successful the product of the American farm will be sufficient to feed the people of the world for generations to come. Our initiative to this end is the development of the coöperative measures to finance agriculture and to establish modern systems and skilled salesmanship in the marketing of farm products.

"EXPERIENCE" AND FARM EDUCATION.

In regard to Mr. Coleman's article "City Boy and Agriculture," page 67, at bottom of second paragraph he says: "I am sure I could not have had as thorough a foundation in agriculture if I had devoted some of my time at college to getting experience." At beginning of third paragraph: "As a city-bred boy I recognize my limitations," etc. This is very good proof of lack of "experience" from a farmer's point of view. Does a sailor consider it lost time before the mast? When we do a little thinking, the two professions, following the sea and farming, have problems that are similar. Two men pass an examination as to intelligence equally. One serves before the mast for three years, one serves three years in a school of navigation. There is a chance to command a ship. Which one will get it? The school navigation man may get his orietation—after that he is liable to come to grief. ROBERT JONES.

Woman and the Home

From Day to Day

I WANDERED LONELY AS A CLOUD

I wandered lonely as a cloud
That floats on high o'er vales and hills,
When all at once I saw a crowd,
A host of golden daffodils;
Beside the lake, beneath the trees,
Fluttering and dancing in the breeze.

Continuous as the stars that shine
And twinkle on the milky way,
They stretched in never-ending line
Along the margin of a bay;
Ten thousand saw I at a glance,
Tossing their heads in sprightly dance.

The waves beside them danced, but they
Outdid the sparkling waves in glee:—
A poet could not but be gay,
In such a jocund company;
I gazed—and gazed—but little thought
What wealth the show to me had brought:

For oft, when on my couch I lie
In vacant or in pensive mood,
They flash upon that inward eye
Which is the bliss of solitude,
And then my heart with pleasure fills
And dances with the daffodils.

—William Wordsworth.

*

FISH and potato salad is prepared as follows: Slice six medium sized boiled potatoes, and mix with one cup of cold boiled fish (cod, salmon, halibut, or canned tuna). Pour over the following dressing: Three tablespoonfuls melted butter, three tablespoonfuls cream, one-half teaspoonful salt, one-fourth teaspoonful pepper, one-fourth teaspoonful mustard. Stir in one cupful of vinegar, and bring to a boil, stirring well. Then add three eggs, beaten well, to the hot dressing, remove from the fire, and beat five minutes. Let it cool, then pour over the salad. Serve in a nest of lettuce leaves, garnished with rings of hard-boiled eggs.

*

HERE is a wonderful walnut cake. Its peculiarity is the absence of flour: Materials required are one pound of English walnuts, six eggs, one cup of sugar, one teaspoon flavoring, 1½ teaspoon baking powder. Grind the nuts in a meat chopper. Beat the whites of the eggs quite stiff, and add sugar. Beat yolks until creamy, add them, and then flavoring. Mix baking powder thoroughly into the walnuts, then carefully fold into the egg mixture. Bake in two layers and put together with a layer of whipped cream.

*

A MIXTURE used by professional cleaners to take milk and coffee stains out of woolen and mixed fabrics consists of one part glycerin, nine parts water and one-half part ammonia. This mixture is applied with a brush and allowed to remain for 12 hours, the moistening being occasionally renewed. After this the stained place is pressed between cloth and then rubbed with a clean rag. Drying, and if possible a little steaming, completes the cleansing process. The first-aid process for removing milk or coffee and milk stains from black garments, used in quick lunch restaurants, is an immediate application of hot black coffee, and this is very efficacious. Milk and coffee stains on delicate silks are quite hard to remove, but a mixture used quite successfully is five parts of glycerin, five parts of water, and one-fourth part of ammonia. Before using this mixture a little must be tried on some part of the garment where it will not be noticed, to see whether the color is changed by it; if so the ammonia must be omitted. If it does not change, or regains color after drying, the mixture is brushed on with a soft brush, allowed to remain for six or eight hours, and is then rubbed with a clean cloth, any remaining dry substance being carefully taken off with a knife. The spots are then brushed over with clean water, pressed between cloths, and dried. If some of the stain still persists, it may be removed by rubbing with dry bread. If the finish of the silk is affected it is usually restored by brushing with a thin solution of gum arabic, drying, and then ironing carefully.

Lard That Keeps.

I noticed recently one woman has trouble to keep her lard. When I began housekeeping, which was many years ago, I had a lot of trouble that way. I kept my lard in the cellar as a matter of course, to keep cool, but it would get green and unfit for use. I read in a paper, "Never keep your lard in the cellar, but in the upper part of the house." I have since done that way, and have no more trouble. Two years ago this Winter I put my lard in gallon and half-gallon jars, covering with waxed paper and placing them in the upstairs chamber, bringing a jar down when needed and kept in the pantry to be handy until each jar was nsed. I used the last in November of last year, and apparently it was as sweet and fresh as at first. Think it would keep over two years if one wished to keep it that long. It seems to need a dry place, and hot weather does not seem to hurt it at all. M. A. C.

The Rural Patterns.

When ordering patterns always give number of pattern and measurement desired.

7773 Blouse with vest, 34 to 50 bust. With or without peplum and chemisette. 8115 Fancy blouse, 34 to 42 bust. With long or three-quarter sleeves. 8106 Three

piece skirt with simulated tunic, 22 to 32 waist. With high or natural waist line. 8099 Over-blouse with tunic and skirt, 34 to 42 bust. To be worn over any guimpe. 8108 Peg top skirt for misses and small women; 16 and 18 years. With high or natural waist line.

Fancy blouse, 34 to 44 bust. With three-quarter or long sleeves. 8124 Empire negligee, 34 to 42 bust. With three-piece skirt, elbow or long sleeves. 8092 One-piece skirt, 22 to 30 waist. With high or natural waist line, with or without frill. 8120 Two-piece skirt, 22 to 32 waist. With high or natural waist line. Price of each pattern, 10 cents.

The Magic Flight of Thought

AGES ago, Thor, the champion of the Scandinavian gods, invaded Jotunheim, the land of the giants, and was challenged to feats of skill by Loki, the king.

Thor matched Thialfi, the swiftest of mortals, against Hugi in a footrace. Thrice they swept over the course, but each time Thialfi was hopelessly defeated by Loki's runner.

Loki confessed to Thor afterwards that he had deceived the god by enchantments, saying, "Hugi was my thought, and what speed can ever equal his?"

But the flight of thought is no longer a magic power of mythical beings, for the Bell Telephone has made it a common daily experience.

Over the telephone, the spoken thought is transmitted instantly, directly where we send it, outdistancing every other means for the carrying of messages.

In the Bell System, the telephone lines reach throughout the country, and the thoughts of the people are carried with lightning speed in all directions, one mile, a hundred, or two thousand miles away.

And because the Bell System so adequately serves the practical needs of the people, the magic of thought's swift flight occurs 25,000,000 times every twenty-four hours.

That Pressing Need.

Aunt Martha and I were tired after a day of shopping, and we rode homeward in the electric car in silence. Without fully realizing what I did I gazed fixedly at a neatly darned three-cornered tear in the coat of a young man who sat in front of us. It was an unusually neat piece of work. The darning had been done with a thread of the goods, which had been raveled from some hidden seam, and the stitches had been set evenly, carefully following the warp and woof of the cloth. Only the roughened edges of the tear remained as witness to the disaster that caused the rent. So carefully had the darning been done that I wondered vaguely why the tear still showed. Suddenly Aunt Martha spoke. "That represents pressing need," she said. I looked at her quickly and saw that she too was looking at the tear. I must have looked my inquiry as to her meaning, for she reddened and said in a whisper, "O, I didn't mean to say that, I was thinking out loud. I will explain later."

That evening after we had rested a bit, I asked for her explanation, for there was nothing about the young man to suggest poverty. "No, the young man is not in need," said Aunt Martha. "It is only his coat. Did you notice how neatly it was mended and yet how visible the rent was?" I nodded in the affirmative. "Well, I was just thinking what a pity it was that the one who darned so beautifully had not learned the value of pressing." Now I understood, but Aunt Martha continued.

"If after having darned that coat she had dampened a piece of dark cheesecloth and laid it over her work and carefully pressed it until it was dry, it would have taken a magnifying glass to reveal that it had been mended."

"But isn't there danger that the iron will leave the goods shiny, or that there will be a mark of the flat iron on the goods?" I asked, for I had seen such evidences of pressing.

"Not the slightest danger if one uses common sense," she replied. "When you are pressing a darn, lay the damp cloth over the work, and with an iron comfortably hot press firmly down over the darn. Don't iron it, and don't leave your iron standing on the cloth a second. Just set it on firmly and lift it at once, then repeat, setting the iron on and lifting it until the cheesecloth is nearly dry; then you can iron over the whole, always keeping the cheesecloth between your iron and the cloth. If it is so you can get at the under side of the goods easily, it is a good idea to turn the goods over the last thing and press lightly on the wrong side. Even a poorly darned tear can be so pressed as to be scarcely noticed. Pressing is an art to be learned before embroidery or sewing, in my opinion. I have seen women wear dresses made of most expensive materials, with stitching and needlework which might well be the envy of queens, and yet the gowns looked commonplace and even botchy because the seamstress had not learned the art of pressing. And my heart has ached for the poor children who have to wear made-over clothes or have their clothes let down, not because the things had to be made over, for often the made-over garment is of nicer material than one would buy new for a child, but because creases and wrinkles had not been properly pressed out, and clothes which might look new and interesting have instead a stringy, made-over appearance which is humiliating to the child. The hem let down and the crease of the old hem left unpressed is a disgrace to the seamstress."

Aunt Martha had struck a hobby, and she always warms to the occasion when she gets to talking on her hobbies.

"Take your own clothes," she said, looking me over critically, "How would they look before you had worn them six months if you did not press them?"

"Not very presentable," I replied, and I guess my face reddened, for I do have to wear my clothes a long time, and in order to keep them from seeming shabby I have to attend strictly to the matter of keeping them brushed clean and the wrinkles smoothed out with an iron. Doubtless my aunt saw the red in my face, for she made haste to say, "Exactly, but as it is, you always look as if you had donned a brand new gown; but I did not mean to be personal, my dear. Only, one sees so many looking shabby and poor when all that they need to give them a smart up-to-date appearance is a good pressing, that sometimes it gets on my nerves, and that tear to-day started all my resentment. I truly believe a most pressing need of the times in many quarters is more pressing," she finished with a laugh. "Now let us forget the rough edges and talk of something pleasant."

The next time I went shopping I looked at the crowds about me with Aunt Martha's words in mind, and I had to admit that the difference between the well-dressed and the shabby was largely a matter of "pressing need" which the flat-iron could supply in many instances.

MARTHA'S NIECE.

Other Ways With Eggs.

"Boiled, fried and scrambled; scrambled, boiled or fried—and then begin all over again!" Is there one rural housewife who has not felt rebellious that appetites persist in the same old way, even when food materials are limited? Try the eggs scalloped.

Scalloped.—Butter a pudding dish freely. Break in a layer of eggs. Season to taste and cover with bread crumbs, over which put tiny dots of butter. Then add more eggs and do the same. Continue until you have enough for your family. Pour over it a cup of milk, and bake 20 minutes in a quick oven. Serve with baked potatoes.

Baked Eggs.—Butter a pie plate. Break the eggs and season to taste. Bake in a hot oven 10 minutes. Crisp some bacon on a separate plate, and serve both with freshly boiled potatoes.

Veiled Eggs.—Chop cold hard-boiled eggs, and turn them into a hot frying pan where you have crisped some bacon, but remove it and most of the fat. Stir constantly, and at the last moment pour on a cup of milk, stirring again and adding salt. Serve on thin slices of crisp toast, with creamed potatoes.

Creamed Eggs.—Make a white sauce with a tablespoonful of butter mixed into two of flour until smooth. Melt another spoonful of butter, or of bacon fat in the frying pan, adding a pint of milk that has been salted. Stir in the flour and butter paste, and when the mixture boils add half a dozen chopped eggs that have been boiled. Season to taste and pour over whole boiled potatoes, in a deep dish.

Egg and Tomato Toast.—Poach the eggs until hard, one for each slice of toast on a hot plate, separately. Stew tomatoes and season them, thickening them a little bit. Pour half a cupful on each egg, under which the toast has been put.

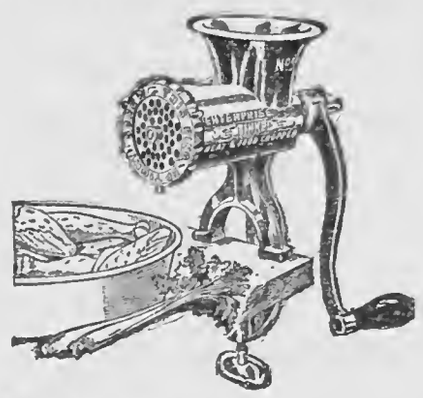
LUCY A. YENDES.

Apple Dumplings.

I see two others are ahead of me on the apple dumpling question. I asked my father how his mother used to make apple dumplings, and he went back nearly 70 years and told me almost word for word the same as Mrs. Lampman has written, even to the cornmeal pudding boiled in a bag with ham or a boiled dinner. He said those puddings used to melt away like dew before the sun. And I can imagine they did, for his mother had thirteen children. But what of the apple dumplings of to-day? I know of no one who makes them but myself. I know of several who like them, but they say their women folks cannot make them. I make them a little different from what my grandmother did. Pare and core apples to half fill a small, smooth-bottomed iron kettle, add a very little water, or enough to keep the apple from scorching. Make dough as for cream of tartar biscuit, and when the apple begins to boil lay the cut-out biscuits around on the apple. Cover closely and let steam. Twenty minutes or half an hour will be long enough. If too much water is added to the apple the dough will settle into it and the dumplings will be heavy. If the apple stops cooking before they are done they will be heavy. Uncover as soon as cooked. Serve with pudding sauce made of brown sugar.

ANNA D. LOVERING.

A GOOD book is the precious lifeblood of a master spirit, embalmed and treasured up on purpose to a life beyond a life—Milton.



Meals that are Easier and Quicker to Get

The splendid d'shes which can be prepared are only one reason why there should be in every farm kitchen an

ENTERPRISE

Meat AND Food Chopper

Meals can be ready in less time and with less work. Then there is the saving in food cost from using "left-overs" instead of having to throw food away. You can hardly realize what a help it is until you have used one. If you do any butchering, this is just the machine for chopping sausage meat. It is the one chopper that gives the chopping cut—does not squeeze, mangle or crush. The chopping is done by a sharp four-bladed knife that revolves rapidly and cuts clean and fast. This is unquestionably the best machine on the market. Family size, $1.75. Large size, $2.50. If you want a still lower-priced machine, ask to see the ENTERPRISE FOOD CHOPPER. From $1.25 to $2.25, according to size.

Send 4c for our new cook book, "*The Enterprising Housekeeper.*" Well worth having.

Mrs. Corntassel: "Oh, dear! Just look at this! And smell it! John caught a skunk in the hen house last night—and his shirt and trousers are ruined. He didn't know what it was in the dark. I'll *never* get the smell out."

Anty Drudge: "Well—I don't know. That's one thing I've never meddled with. But if anything will bring out both stain and smell, it's Fels-Naptha Soap. Let's try it, anyway. I see you have a box. That's right. I always tell everybody to keep plenty on hand."

Never be sure that a thing is ruined until you have tried washing it with Fels-Naptha Soap. If Fels-Naptha in cool or luke-warm water doesn't do the work, you might as well throw the article away.

Fels-Naptha dissolves grease, makes dirt disappear and takes out all kinds of stains. Clothes washed with Fels-Naptha do not have to be rubbed hard nor boiled and are cleaner, sweeter and whiter than ever before. It does all kinds of housework easily, thoroughly and in less than half the time it used to take.

Just follow the easy directions on the red and green wrapper.

Better buy it by the carton or box.

Fels & Co., Philadelphia.

THE ROUGH AND READY AYRSHIRE.

Being a farmer and reader of THE R. N.-Y. I take great interest in your reports giving reasons for certain breeds. Cut below gives a picture of my pure-bred Ayrshires grazing on the hillside, and I give few reasons for my breeding them. I have been farming seven years and I have been raising Ayrshires all the time. I find by having another cow

A BUNCH OF PRIZE AYRSHIRES.

occasionally, that my Ayrshires require less feed and produce more milk than the others and when in pasture they are always sleek, while the others become thin. I haul my milk to a milkman, where I get 18 cents per gallon. Following is my milk record from seven cows for 1913, which I consider very good, for I do not feed when I have my cows in pasture, which is from about June 1 to November 1. I am an exhibitor at the "Great Allentown Fair" and in these seven years have won six of the seven blue ribbons for my herd, which counts much for an ordinary farmer.

RECORD FOR 1913.

	Gallons.	
January,	450	$ 87.00
February,	319½	57.49
March,	206¼	37.19

November,	556¼	100.13
December,	505¾	91.03
Total	5,294½	$953.21

Pennsylvania. EDGAR T. FINK.

HOGS FOR PASTURE.

What kind of hogs is best for use in an apple orchard, an old rocky hillside with big trees? I am told Berkshires will not rustle as well or pasture as will some other breeds. Our sows are mostly Chester Whites, and the selection of the boar is the problem. E. P.

Windsor, Conn.

There is no breed of swine especially adapted for forage purposes. Any of the recognized fat breeds will thrive in pastured areas, provided they are given in addition sufficient grain to enable rapid and continuous growth. Representatives of the bacon breeds are not so well adapted for pasturing, as they are inclined to waste and utilize energy roaming about the field. If your inquirer has Chester White swine, I would say that the best male to use would be a Chester White male, for I believe in mating animals of the same breed rather than cross-breeding. The Duroc Jersey breed of swine is noteworthy for its foraging and adaptability for Eastern conditions, and if it is purely market animals that are desired, a Duroc Jersey male might be appropriately crossed with Chester White sows, and the result would be pigs that would fatten readily, and would be well adapted for use under these conditions. In this connection a mineral mixture should be used to keep the swine from doing injury to the roots of the trees, and we have used in our regular forage crop pasture a mixture composed of equal parts of air slaked lime, bone meal, ferrous sulphate, salt and charcoal. There is some difference of opinion as to the practicability of pasturing swine in orchards, and of course, the animals should not be permitted to injure the trees. F. C. M.

SLIMY MILK VESSELS.

What is the cause of a cloth milk strainer being slippery and slimy when put into water containing a little soap? This condition lasts only a few milkings, then disappears for sometimes weeks at a time. The same is true of the pans and pails. C. M. S.

Massachusetts.

This is probably caused by a germ which we have mentioned several times. This germ turns milk slimy or "ropy." It is usually bred and carried in the strainer or dishcloth, or under the rim or seams of the pans. It is also found in the stalls and on the cows. A thorough *boiling* of all milk utensils and their exposure to full sunlight kills out this germ.

DAIRY MATTERS IN S. W. NEW YORK.

I have read in THE R. N.-Y. articles on farmers joining themselves together in club work for purchasing purebred sires or stock. Perhaps the enclosed clipping will interest you, and by keeping in touch with these persons both you and the readers of THE R. N.-Y. may learn the success these farmers have. As you asked me some time ago to write on the condition of dairy matters in my section, I write the following to you: In this locality, we are favored by having a milk station and several cheese factories situated so that they are very convenient for the farmers to dispose of their milk. When the milk station decided to take milk seven years ago, a number of cheese factories were purchased at reasonable prices by the persons running the milk station, so that the milk from these factories would come to the milk station. The milk station has been a great benefit to the farmers in being situated so as to take milk the year round, and paying a better price than the farmers could realize from the factories.

The farmers are encouraged by the better price for their milk, the prompt payment each month and the receiving of clean milk cans for the milk. The farmers have bettered their dairies by breeding to the Holstein cattle to get larger quantities of milk and still have the required richness. They are only saving the calves from their best cows that produce well, which is shown at milking time both by the looks of the quantity in the pail, and by weighing the milk at each milking, and keeping records of the same, also those cows which give an even amount of milk the year round, which counts in the long run.

The farmers are gradually selling off the boarder, the dark colored, and the smaller sized cows, and are taking great interest in having their herds of uniform size, shape and color. Not many have purebred stock throughout their herds, yet many are working into the purebred Holsteins on a small scale, but nearly all are using purebred Holstein sires in the dairies, and have been for several years back, and getting good results by this method, weeding out and filling in with their calves from the best cows.

FRED W. TUCKER.

Allegany Co., N. Y.

R. N.-Y.—The clipping referred to follows:

One of the highest bred and most valuable bulls ever brought into this part of the State, was recently purchased by a party of well-known farmers of Jasper. It is a Holstein bull calf, purchased from the H. B. Davis Stock Farms of Orange County. The price paid is $1,200. The farmers who made the purchase are: J. R. Towsley, G. A. Murphy, S. F. Dartt, A. A. Button and Fitch H. Reynolds.

We shall be glad to watch the outcome of this coöperative investment.

PROLIFIC SOW.

We wish to report an unusual instance of prolificacy. One of our brood sows, Highwood Columbia 20th. 116241, farrowed February 5, 1907, produced a litter of 13 pigs early this week. This makes a total of 168 pigs she has farrowed in 13 litters. Even at her advanced age her last three litters have been 13, 12 and 13 pigs. This sow, of course, is a registered Berkshire. A full sister, three years younger, farrowed 15 pigs for her first litter, at 13 months of age. Then she farrowed 10 and then 18. We have four young sows that are half sisters of Highwood Columbia 20th, out of a common dam. They farrowed their third litters last Fall and produced respectively 10, 12, 14 and 17 pigs. Sows in our herd, of this Columbia family, have averaged now for several years, gilts and all, from 10.6 to 11.8 pigs per litter. H. C. & H. B. HARPENDING.

Proportion of Butter to Milk.

About how many quarts of milk on an average will make one pound of butter? What is the weight of a quart of milk? We retail milk at seven cents per quart. At that rate what is cream worth per quart, also skim-milk fed to calves or pigs? Our cows are grades, fed oat and pea hay, pea vines from canning factory, sowed corn, cull beans, cooked, ground feed, oats barley, wheat, about equal parts; cotton-seed meal and molasses.

Medina, N. Y. T. S. T.

The quantity of milk required for a pound of butter depends entirely upon the amount of butterfat which it contains. A pound of butter can be made from eight quarts of rich Jersey or Guernsey milk, while it requires as high as 12 to 15 quarts of the poorer grades of milk to produce the same amount of butter. The average weight of a quart of milk is a little over two pounds; 40 quarts should weigh 83 pounds. The worth or value of cream is also determined by the amount of butterfat which it contains, and milk at seven cents per quart is not a guide to determine the value of cream unless the butterfat contents is known. Theoretically if 5% milk sells for seven cents per quart 20% cream should sell for 28 cents per quart because it contains four times as much butterfat. At this rate the skim-milk would balance the cost of separating it. Skim-milk is usually figured at from 15 to 25 cents per 100 pounds. C. S. G.

Trouble With Milk Testing,

I am having some trouble with my milk at the creamery and I would like to send a sample of it to Albany to have it tested. Will you tell me where and how to send it? Nobody around here seems to know anything about it.

Orange Co., N. Y. J. F. H.

The thing to do in such a case is to notify Hon. Calvin J. Huson, Department of Agriculture, Albany, N. Y. Under the law the commission has the power to investigate such cases. He will, if needed, see that fair samples of the milk are taken and accurately tested. Do not send him samples unless he requests it. Let the deputy do the sampling. Make your complaint quietly. In order to be effective the Department must make its investigation without warning to the creamery, and visit it without warning or announcement.

VERY black, very small, and very much impressed with the importance of her mission, she stood before the kindly lady of the house. "Well, Ophelia?" "Ise de washerwoman's little girl and mommer she says please to len' her a dime. She got to pay some bills."—New Orleans Picayune.

Change bitter butter to *better* butter

Whether you make your own butter or have it made at the creamery, you know that bitter-tasting salt is bound to affect the flavor of the butter. And the price you get for the butter depends mainly on its flavor.

It's easy to prove whether the salt you are using is bitter or not. Test it thus: Make a little brine. If the brine tastes bitter—change to Worcester Salt.

Worcester Salt leaves no bitter taste.

It is always sweet and savory. More—its pure, uniform crystals work into the butter evenly, making "mottling" impossible to occur.

For better butter-flavor and better butter-prices, see that the salt used is always

WORCESTER SALT

The Salt with the Savor

For dairy use, Worcester Salt is put up in 28, 50 and 56 pound bags. The bags are made of the best quality of Irish linen. Good grocers everywhere sell Worcester Salt. Get a bag.

Write for the Worcester Cook Book. It contains recipes for all kinds of savory dishes. Prepared by Mrs. Janet McKenzie Hill, editor of the Boston Cooking School Magazine. Free on request.

SILO TALKS.

Black Ash for Silo.

I am planning to build a silo, and would like your advice on a few points before building it. I have the timber on my place for lumber to build. Would Black ash answer for this purpose, and will one-half-inch boards with a layer of tar paper between be as good as one inch matched boards to ceil inside of silo? W. F. S.

Jefferson, O.

From the inquiry, I am a little in doubt whether the silo, frame and all, is to be built from Black ash lumber, or just ash flooring for the inside lining to face against the silage. As to the use of ash for the frame, there can be no objection; but for the inside facing would ash be as good as to procure Georgia or pitch pine flooring, and be sure about it? If the ash were used, I would not double board it, with paper between, but matched; and be sure it is well seasoned, and when on, give it a thorough painting inside with gas tar and gasoline enough in it to spread freely, and penetrate the flooring, and fill into the matching. This will prevent the moisture of the silage penetrating the wood, and as the boards would then be kept free from moisture on the outside the lining should keep free from decay a long time. The usual plan about here, whatever kind of lumber goes into the frame, is to use Georgia pine for the inside work, and if free of sap, it lasts for years. One of my silos built 24 years ago, but lined up inside with common White pine, and thoroughly painted with gas tar and gasoline, is apparently as sound as ever. Where Georgia pine is used, no one paints them, as the pitch makes them moisture-proof. This you could do, put on the ash flooring, and if at the end of a few years it did show signs of decay, you could quickly ceil on over it and then you would be trouble-free for years.

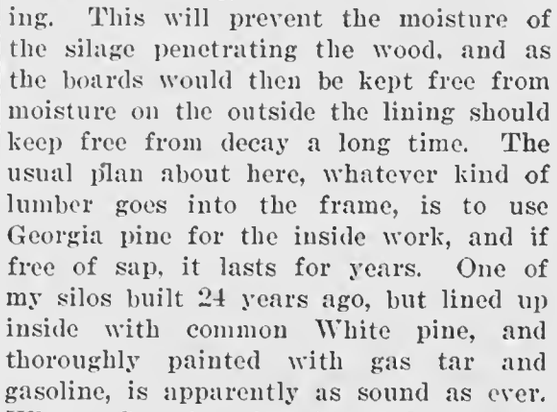
JOHN GOULD.

Best Wooden Form.

Which is the more advisable silo to build, a wooden one or one built of glazed or vitrified blocks? If of wood what style is the best? R. D. A.

Cayuga Co., N. Y.

It is an even toss-up which style of silo to build, wood or glazed blocks, which are I suppose hollow vitrified brick with interlocking joints. If one builds of



CORNER OF SQUARE SILO.

blocks, is sure of the foundation not settling, the bricks laid up in best cement, and well protected with plenty of reinforcing hoops laid in the bedding cement, he has a silo of great value, but the history of such silos about here is not wholly devoid of bad results of toppling, cracking, etc., and all because of bad foundations, and no use of reinforcing hoops. If you build of wood, the kinds from which you may select are without number. In this section of silos and much new silo building, it is to be noticed that for the past two years there has been about a total return to the square wooden silo with horizontal girths, and lined up inside with Georgia pine flooring, three-inch widths, finished up outside as the owner desires. Six of these—all very large ones—were built in sight of the writer's home last Summer; in fact, two-thirds of all have been built that way from the start. Asked why he built that way now the farmer replies: "They do not crack, or fall down, hoops do not loosen, and let the silo collapse; they are always ready to fill, they are durable and they keep silage with the best, and then, I can put in my own farm timber at first cost." Whatever plan settled upon, if of tile, be sure of foundation, and insist on reinforcing hoops in plenty. If a stave silo, be sure that it will hold as many tons as represented, and if a square one, have plenty of girths. If set on a self-drained foundation, do not cement the floor, save a strip a foot wide up against the inside wall. J. G.

TEN COWS AND A LIVING.

Can a living be made by keeping 10 cows, buying all grain and fodder, doing all the work myself, and selling the milk at eight cents per quart in Summer and nine cents in Winter? Or is it more profitable to buy a cheap farm and sell milk at a creamery at about 3½ cents per quart in Vermont? How many quarts of milk are there in a hundred pounds weight? C. J. L.

Massachusetts.

As a naked proposition, and without considering the thousand and one "ifs" concerned, I should say that a fair living might be made from 10 cows whose milk could be sold at eight and nine cents per quart, if the owner could do all the work connected with the business, even though all of the feed were purchased. The margin would not be large, however, and might easily be turned from profit to loss by a little "bad luck." In comparison with buying a cheap Vermont farm and selling milk at 3½ cents per quart, I should consider it a sure road to opulence. Your experiment station at Amherst, after a six-year study of their herd of grade Jerseys, giving better than 6,000 pounds of milk each, per year, has concluded that it costs practically 5½ cents per quart to produce milk in Massachusetts. You could hardly hope to produce it any cheaper and buy all your feed. This amount allows $35 per year for labor in caring for each cow, or $350 for 10 cows. Now this $350 is a nice little start toward the living expenses of a family, and is so much to the good. Granting that you can get together 10 cows, giving 60,000 pounds of milk yearly (and this means a herd above the average in quality), and that you can sell this milk (26,666 quarts) at an average price of 8½ cents per quart, you will have $800 to pay the cost of selling your product and furnish your profit. If it cost you nothing to sell your milk, you would have a yearly income from those cows of $1,150, but as it is, you will have to subtract from this sum the cost of delivering the milk to your customers, and the losses from poor accounts, etc. It seems to me that the cost of delivering could hardly be less than $1 per day, and this, with unavoidable losses, would probably amount to at least $500 per year. Deducting this from the $1,150, you would have $650 per year for your "living." This can hardly be considered an attractive proposition, and I should not care to be responsible for encouraging anyone to undertake it. Before doing it, at least you should talk with practical dairymen on the ground and get their estimate of its practicability.

A quart of milk weighs 2.15 pounds, though 2.25 pounds is often used to allow for shrinkage in handling. A hundred pounds of milk is equivalent, therefore, to 46½ quarts. M. B. D.

LIVE STOCK THAT PAYS NO DIVIDENDS

It is said that "a poor man will have one dog, a very poor man two and an almighty poor man three or more." This may not be literally true, but I have noticed that the thriftiest farmers keep the fewest dogs. An untrained dog on the farm, invariably makes more steps than he saves, and most dogs kept on the farm are untrained. Few farmers know how to train a dog, and not many have the time to devote to the work. Only the man who deals in stock and handles it continually can train a dog and keep him in training to the extent that makes him useful. There may be isolated cases of well-trained and useful farm dogs, but they are the exceptions that prove the rule, and even in these rare cases, if the cost of dog, cost of keep, taxes and cost of time spent in training were taken into account the dog would be found to be the debtor.

Some keep dogs as thief and burglar alarms. Their sagacity does not always enable them to distinguish friend from foe, and if savage, they are sometimes positively dangerous. Last Fall out in Jefferson Co., Kansas, a farmer was awakened at midnight by a great commotion among his hogs. He knew by the sound that a dog was making the disturbance and grabbing a 16-shot repeating rfle, he ran out to the rescue. He found a big white bulldog just dragging a hog out of the pen. He fired, and at the first shot happened to break the dog's spine. The dog instantly turned on him and dragging his hind parts, attacked him savagely. The man kept backing away from him, all the time pumping lead into him till he had fired the whole 16 shots. By this time his son got there with a shotgun and killed the dog. They found that nearly all the little bullets had hit the dog, but none reached a vital part. During the whole battle the dog never once yelped or whined, but at every shot he uttered a deep growl and lunged at the man to the full extent of his crippled condition. It was afterward learned that the owner lived five miles away, that the dog was a pedigreed bulldog that he had paid a big price for, and kept chained at the house because his wife was afraid to stay alone. The dog had broken his chain and as soon as the man found he was loose he telephoned to his neighbors to keep their children in the house for fear the dog would kill them. He said to the man who killed the dog, "He might have killed you too if you hadn't happened to have disabled him at the first shot."

We sometimes hear fairy tales about dogs saving people, especially children, from drowning. Within a few miles of where I now live, a big strong collie drowned a little two-year-old girl by pulling her into a swift running ditch, and right in our own town another dog that was such an intolerable nuisance in the neighborhood that his owner had to keep him shut up in the barn, crippled his master's wife for life. She had so much sympathy for the dog that she thought she'd lead him out and let him play at the end of a long rope. He soon tangled her up in the rope, threw her to the ground and fractured her knee and tore the ligaments loose, making her a bad cripple for life. She will never walk again, not even with the aid of crutches.

A few years ago, two bird dogs—probably strays—killed one-half my breeding ewes—32—in one night. We killed one of the dogs the same day, and the other was killed a few days afterward. The owners were never found. Three years later two purebred Shepherd dogs—the breed that are supposed never to kill sheep—raided my flock three nights in succession. The third night I heard them at two o'clock and got right after them with my shotgun, killed one just at daylight and followed the other home. They had that night killed 11 sheep for one of my neighbors, six for another and three for myself. The owners of these dogs paid $30 each for the work of their fine dogs, that one night. It is seldom such swift retribution overtakes the sheep-killing dogs. They are sneaks, and are seldom caught at their murderous work.

The foregoing are only a few of the many counts to be made against the dog. I would not for a moment count the value of all the dogs in the universe against the suffering and death of one member of the human family from hydrophobia. It is natural for people to be fond of pets. It is an admirable trait, but it would be well if we could content ourselves with more useful and less costly and dangerous pets. E. P. SNYDER.

COTTAGE CHEESE.

Will you give information about making cottage cheese, full directions if possible? D. F.

If you wish directions for making cottage cheese on a small scale for family use, the following method used by the cheese-maker on this farm will probably be satisfactory—her cottage cheese is, anyway. Place a pan of soured skim-milk of any desired size over a vessel of boiling water upon the kitchen stove. Stir occasionally so that it will heat uniformly, and when the whey and curd have separated so that the latter will sink to the bottom of the pan, drain off the whey, or strain through a thin cloth to remove it, and season the curd left by adding salt, pepper, butter, and sweet cream, to taste. The sweet cream may be omitted if not at hand, but you will miss it in the cheese. Mix the seasoning in by hand and form the cheese into convenient-sized balls. If you desire to make cottage cheese on a commercial scale, it will pay you to send to the Experiment Station at Geneva, N. Y., for Bulletin No. 245. This bulletin is devoted to that subject, and gives full directions for the making and use of "starter," and for the carrying out of the other necessary processes. M. B. D.

Why Dave stayed on his father's farm

OLD Man Hicks, the dairy farmer, had a herd of mighty fine cows. He also had a son named Dave who thought milking a pretty tough job, and who imagined he was getting weak-handed and on the way to milker's paralysis. So he laid down on the job and the old man had to milk all the kickers and fussy bovines.

Then one day Hicks, Sr., saw the light. He installed a

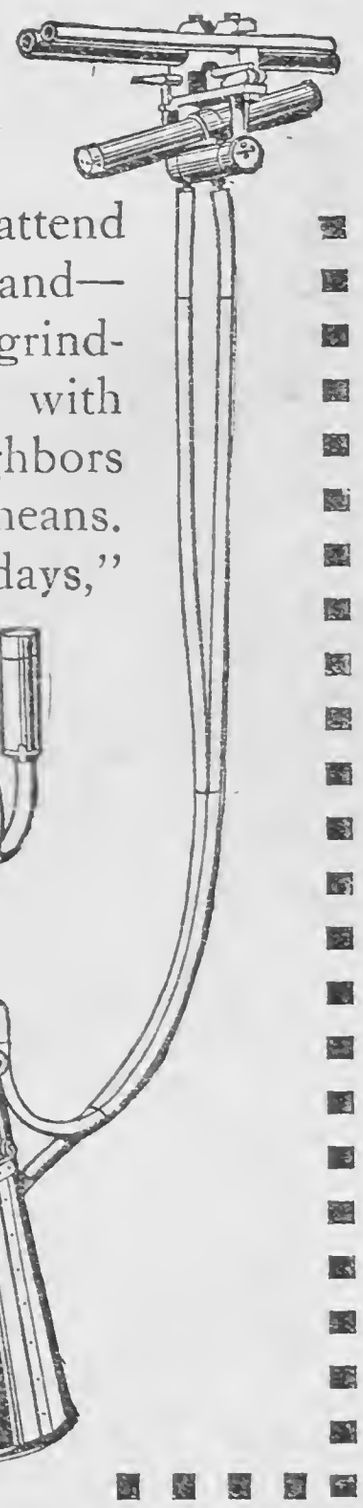
SHARPLES MILKER

That was four years ago and ever since, twice a day, the herd has been machine-milked, the kickers and fussy producers give down without being chained, and Dave's doing the work formerly done by Dad and two husky hired hands.

Long ago the son forgot paralysis in standing by and watching the teat cup with the upward squeeze get Bossy's milk. When she persists in yielding 30 pounds of fluid, the machine sticks to her and gets all of it. There are no finger nails gouging out a bit of teat or scratching her udder. She's not sworn at now—she's sworn by. She no longer holds up her milk, for the machine does what human hands can't do—draws the milk intermittently with a soothing massage motion, driving the blood up and the milk down. And Bossy knows that's how she ought to be milked.

Dave's now clamoring for a bigger dairy and another machine. The only way to use the hour or more saved at each end of the day is to put in more cows and increase the size of Dad's bank roll.

Ask Old Man Hicks what the SHARPLES MILKER is and does. He'll say it's a clean-milk getter and a hold-'em-on instead of drive-'em-off-the-farm proposition. He never has the least trouble in getting and keeping capable help. While Dave holds down the job, Hicks now has time to attend county fairs, conventions, socials, and—what he seldom did in the old grind-early-till-late days—go to meetin' with Mrs. Hicks and mix with the neighbors and discuss politics and ways and means. "The joke's on Bossy these days," declares Hicks.



The same catalog that put Hicks in touch with the SHARPLES MILKER and prosperity is at your disposal. Why not ask for your copy?

How Much Per Day Do You Pay for Rubber Footwear?

The price you pay for Rubber Footwear means nothing unless you figure how many days that footwear is going to last.

Figure the number of days' wear that "Ball-Band" Rubber Footwear gives and you will see why eight million men wear it.

"BALL (Red) BAND" TRADE MARK

Every year we put into these goods money that we might be putting into our pockets—but our record is that the quality of "Ball-Band" is still the highest; the fit, finest; the wear, longest. Look for the *Red Ball* when buying—sold by 45,000 dealers. If your dealer can't supply, write us. Write anyway for free illustrated booklet about "Ball-Band" Footwear.

Eureka *Send for Catalog—FREE*

Potato Planter

Profitable for the large or small grower. Plants potatoes at lowest possible cost. *One* man operates it. Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if wanted)—covers up—marks the next row. Accurate, automatic and dependable. Sold with or without Fertilizer Attachment.

Here's why you should select the Eureka Potato Planter:—Furrow Opening Plow is directly under the axle—that means uniform depth at all times. The seed drops in sight of driver. Steel and malleable construction makes long life and few repairs. Made in three sizes—for one or two rows.

We also make the Eureka Mulcher and Seeder. Shipped from branch near you.

EUREKA MOWER CO., BOX 840, UTICA, N. Y.

Grinds Oat Hulls at One Grinding

Fine enough to feed swine. Only grinder for the price that does this. Grinds ear corn, screenings, seeds, hay or any grain. 1 set buhrs grinds 1,000 to 3,000 bushels.

Letz Self Sharpening Silent Buhr **Feed Mill**

Write, giving H. P. of your engine and we'll tell you how you can try this force feed mill 10 days at our risk.

Farm Management.

Farming on Shares.

A has about 15 acres of land plowed; he wishes us to work it next year. He would like to put in one acre of onions and three of potatoes, the remainder to mangel beets, sweet corn and field beans. He will furnish the onion sets and seed potatoes; will also furnish a potato digger if the crop is worth it; we furnish remainder of seed and do all the work. What share should A get? F. B.

Ft. Helen, Mich.

In all such cases of farm partnership the general rule is to let the real estate offset the labor—each one-third. The other third is represented by personal property, which will include capital or money paid out for labor, fertilizer, seed, etc., movable equipment, such as tools. In this case you provide labor and the other party the land, and each should take one-third share as a consequence. The other share should be divided in proportion to what you each put up in seed, fertilizer or capital. You should also have a legal written contract.

Landlord and Tenant.

I have been very much interested in the writings on landlord and tenant. The man in central Illinois, page 35, is giving some very good argument, and as I have seen the other side of that fruit business I will relate. My wife was clubbing the fruit from an apple tree, and when noticed by the boss, naturally she got no more fruit by the use of the club. I took up the argument from a point that the owner of the buildings should have at least enough ladder to reach top of any building on the farm. We all know that in case of fire clubs won't work. The landlord mentions the clubbing of peach and plum trees. I am a tree surgeon, and I would never allow a plum or peach tree to get from the reach of an ordinary step ladder. If this man would expect his tenants to trim trees, he cannot expect much fruit, as we have in this locality about one man in 20 who actually knows how to trim and care for a fruit tree. A. Z.

Ashland, Ohio.

Getting Hay Into Barn.

In reply to J. F. T., page 128, the one best horse hay-fork is a six-tine grapple fork which opens and closes like a clam-shell bucket. My father has used one for over 20 years and it cannot be excelled for its work. This one has a lever for dumping, but I believe the newer ones do not have this, which I should consider an improvement. This fork takes a large amount of material at a trip and dumps it in a looser condition to be mowed away by hand. With this fork he uses a 4x4-inch wood track which has proved entirely satisfactory. Track whether wood or steel, should be supported every six or eight feet to keep from sagging. I have seen rod tracks fastened at each end of building, but they strain the frame and sag badly. We have always used a horse for hay-fork, but am confident that a small gasoline engine would be a great economy in time as well as labor.

R. P. H.

Responding to your request for experience in use of hay hoisting apparatus, I have used a steel track for 10 years, and it appears as good as ever. I have to go up to the machine when changing sides, but they are now made that can be changed from the floor very quickly. I use slings, and I think they will pay their cost in saving of time, compared with forks. Besides, forks do not work very well with rye and oats. I use power, and make many other uses of the hoist. My grain is cleaned and bagged in the basement, and a sling-load of eight bags is taken up through a trap-door and deposited on the wagon in about the time it would take a man to bring one bag up on his back. My hay is all baled, and by using a pair of ice tongs, a bale of hay is landed on the wagon, or put away on a scaffold. In throwing down hay for baling, we use the hay fork and take a load out of the mow and drop it by the baling machine. The tracks can be made to run on a curve so you can hoist on the main floor and send around to the faraway mow, or even to an adjoining building. The slings can be made to fit any wagon; it is only a question of length of ropes. FRANK HYDE.

New York.

JOHN DEERE TWO WAY PLOW

The Sulky with the Steel Frame and Patent Auto Foot Frame Shift

The John Deere Two-Way Plow will work equally well on hillsides and level land. It is well balanced, easy to operate, light draft and efficient,—built in the East for Eastern conditions.

It is the only two-way plow that has the Patent Auto Foot Frame Shift, which insures accurate and uniform width of cut. It will do the highest grade work for the longest time with the least possible effort and expense.

These Are Some of the Reasons:

1. **All Steel and Malleable Frame—Steel Arch:** Light, Strong and Durable—Rigid Connections—Permanent Alignments.
2. **Patent Auto Foot Frame Shift:** Slight foot pressure swings frame and accurately locates plow bottom.
3. **Long Malleable Beam Clamps:** No collars or set screws. Beam bolted rigidly to bracket, which extends to each bail arm. Cut always uniform.
4. **Automatic Shifting Hitch:** Positive and Automatic. Clevis cannot fail to move to position.
5. **Automatic Horse Lift:** Operator's foot releases latch. Pull of team raises bottom. Hand lever also provided.
6. **Adjustable Jointers:** Jointers clamped to beam. May be set forward or back or tipped at varying angles.
7. **Wide Tread:** Prevents tipping on hillsides and permits use of wide or narrow bottoms.
8. **Chilled, Full Steel and Combination Bottoms:** All styles made expressly for Eastern conditions.
9. **Removable Shin Piece:** Insures keen cutting edge—easily renewed—prolongs life of moldboard.

Write for John Deere Two-Way Book, handsomely illustrated in colors—and secure full information—free.

Forage for Pigs.

I wish to raise 12 pigs, April farrow, next Summer, besides keeping three sows. What can I grow for green stuff (I have no pasture)? My land is very sandy and full of witch-grass, and I wish to fence in a bad spot to keep pigs on. Shall grow a lot of rape to cut and feed. How about Soy beans and cow peas to feed after and with rape, using corn fodder with poor ears (sweet corn) in Fall, then fattening with ear corn? I want to raise them without buying much grain.

So. Milford, Mass. C. J. D.

Undoubtedly the best forage crop to use for swine in the absence of Alfalfa is Dwarf Essex rape. It would yield a far greater amount of forage than would be the case where Soy beans or cow peas were used, and successive planting of rape may be appropriately made any time during the season up to August 1st. The amount of seed to use per acre varies with the method of planting, and in case the rape is drilled in rows it would require six pounds of the Dwarf Essex variety per acre. If it is not convenient to drill the seed in rows it can be broadcast, in which case it will require from six to 10 pounds of the seed per acre. A very good mixture to be seeded as early in the Spring as soil conditions will permit would be as follows: Oats, 20 pounds; Canada field peas, 30 pounds; Red clover, six pounds; Dwarf Essex rape, six pounds; the same mixed and drilled in with an ordinary eight-inch grain drill. The oats and Canada field peas will seemingly out-distance the rape and clover, but in case the animals are not turned into the field until the oats and peas are about 10 inches high, and care is exercised not to let the animals pasture the crop too closely, you will find that you will have a continuous green forage crop throughout the entire season.

It is advisable, however, in case forage crops are used for pasturing purposes, to have at least two yards to alternate during the season, and by this practice it would be possible to give the plants sufficient freedom to grow vigorously without serious interruption by tramping or cropping it down too closely. I would also suggest that the rape be seeded in the sweet corn just previous to the last cultivation of the corn, and after the marketable ears are taken away the small cull ears can be gathered and fed to the pigs. Rape and corn make an ideal and well-balanced fattening ration. It is sometimes suggested to feed a small amount of tankage in addition as an appetizer and a source of protein. Undoubtedly the inquirer is familiar with the usefulness of Alfalfa or clover hay for brood sows, as it can be fed in slat racks with very good profit and great convenience. F. C. M.

Rye for Mares.

I have 50 acres of nice rye, on a tobacco patch; would like to put some mares on it to graze, that are supposed to be in foal. Would you advise it? I had supposed there was no danger unless they grazed on rye which had headed out, and that it was the blasted grains, which did the mischief, but have been told it was not safe to graze at any stage for mares in foal. W. W. W.

Kentucky.

Sudden full pasturing on green rye often has caused mares to abort. If used at all the mares first should be fed plenty of hay and oat straw, and then should go on the rye for a very short time at first, gradually increasing the time daily. Frosted rye is unfit as feed for mares in foal, as is rye that contains ergot. It would be much safer to use the rye for the pasturing of cattle. A. S. A.

Buying Cow Feed.

One dairyman writing about profits from his cows says that the price of milk is so low that farmers through his section are hardly making a living. He says they don't begin to get 35 cents on the dollar. Yet he also gives some facts in connection with his own individual case that show there is another side to the question besides the consumer's end of it. This writer says that he has been all his life on a farm of 200 acres, yet admits that he buys 30 tons of feed to carry his cows through the Winter. This fact alone proves why his profits are small. If it is impossible to raise Winter feed on a farm, the farm cannot be adapted for dairying. If the 30 tons of feed is all grain, and the farmer has a silo and raises his hay, the farm operations surely are much more profitable than he states if the idle horses are put to good use, during part of the time they would otherwise be idle, raising a cash crop to be sold to pay part of the grain bill. With 6,000-pound cows as he states he possesses there would be undoubtedly a good profit at the end of the year. However, if no silo is being used, if part of that 30 tons of feed is roughage, evidently the land is not adapted for dairying, or not enough crops are raised.

Experience shows that silage fed to cows in connection with clover hay and grain will reduce materially the cost of keeping a cow, and if a farmer on 200 acres of land cannot find enough crop land to enable him to have three 15-acre fields in rotation of silage corn, some small grain and clover, either the land is high up in the hills or is too rocky to plow. While the producing farmer indeed does not get his fair share of what the consumer pays, still, if he must make the most of what he does get, he would better prepare to keep his cows as cheaply as possible if he cares for a profit on his year's work. H. B. COBB.

Jackson Co., O.

Balancing a Ration.

In what proportion must I mix the following feeds to make a good balanced ration? Corn and cob chop, wheat bran, gluten and cottonseed meal, with mixed hay (clover and Timothy) and shredded stover for roughage. A. H.

Elverson, Pa.

Two parts by weight each of corn and cob chop, wheat bran and gluten feed, and three parts cottonseed meal, will make a good ration for milk production. I think it will pay, if labor is not too important a consideration, to sprinkle the corn stover and scatter the grain over it. In this way the cows will relish the stover better, and digestion of both grain and stover will be aided. Of course one should not give more stover than the cows will eat up clean, or some of the grain will be wasted, as well as stover. C. L. M.

A Good Ration.

Will you criticise and improve the following ration for Guernsey cows giving from 30 to 20 pounds milk daily? 35 to 40 pounds silage; 10 pounds mixed hay, Timothy and Red-top; two pounds gluten; two pounds wheat feed; two pounds brewers' grains; one pound oil meal. I am feeding one pound grain for every three pounds milk, gluten costing $1.50, brewers' grains $1.80, meal $1.78, wheat feed $1.55 per hundred. M. A. P.

Milford, N. Y.

I can find no fault with your ration as far as nutrients are concerned, and it seems to be giving good results. The brewers' grains are higher in price than they ought to be. However, something light and bulky is desirable in the ration. If you could get distillers' dried grains at about the same price they would be preferable as they contain more protein and also furnish the desired bulk. C. L. M.

Dairy Judging Contest.

During Farmer's Week which will be held at the College of Agriculture, Ithaca, New York, February 9-14, the Department of Dairy Industry will hold a contest for judging butter, cheese and milk. The contest for judging butter will be held on Tuesday and the contest for judging cheese and milk will be held respectively on Thursday and Friday from 9 to 12. With the exception of the present Winter Dairy Class the contest is open to any resident of New York State. On any day of the contest from 11 to 12, anyone not taking part may review the work of the judges, and thereby gain information regarding dairy products. It is hoped that a number will take part in these contests as they are instructive to anyone who is manufacturing or in any way interested in dairy products. First and second prizes will be offered in each class.

The Milk Comes Out Of The FEED

You can't cut down the amount of your cow's feed or change to a cheaper feed without cutting down your profits. The cow is just a milk factory and she can only make milk according to what you feed her. Give her good rich, easily digested feed, something she relishes and that will keep her in good health and she will give you all the milk she possibly can. A ration to be the most productive must also be properly "balanced"; that is to say, must contain food elements in such proportions as they are found in milk. Don't lose anywhere from one to three quarts of milk daily per cow by attempting to mix your own ration — let an expert do it for you.

Larro-feed

is a thoroughly mixed, properly balanced ready-to-feed dairy ration, made from carefully selected and analyzed feeding stuffs, absolutely free from weed seeds, oat clippings or other fillers and adulterants; it is composed only of Dried Beet Pulp, Cotton-Seed Meal, Gluten Feed, Distillers' Dried Grains, Wheat Bran, Wheat Middlings, and a little salt.

We are so confident that this feed will make good, that we sell it on a guarantee of "satisfaction or money back" with no strings to the guarantee, just simply—if you are not satisfied after feeding 200 lbs. to any one cow say so and you will get your money back. (32)

This paper would not accept our advertisement if we were not thoroughly responsible for this guarantee. You run no risk—why not take a few sacks and find out for yourself that there is more milk in **LARRO-FEED** than in any other ration you ever tried. Ask your dealer for a few sacks, or if he does not handle it yet, **write to us direct.**

I've a Message for Live Stock Owners

EVERY MONTH, for nearly three years, I have been using space in this paper, calling attention to the unusual merit of Sal-Vet — the greatest worm destroyer and live stock conditioner ever offered to the American farmer. I have sold thousands of pounds of **Sal-Vet** to subscribers of this paper, but I still feel there are some who have not accepted my offer to ship them enough **Sal-Vet** to last their stock 60 days **before they pay me one cent.** If you are one of these, I should be particularly pleased if you will give me the opportunity to prove to you, **before you pay,** that you cannot be without

The Great WORM Destroyer **SAL-VET** *The Great LIVE STOCK Conditioner*

TRADE MARK — REG. U.S. PAT. OFF.

S. R. FEIL, Pres. Reg. Pharmacist, Graduate of National Institute of Pharmacy

Worms cause 90 per cent of live stock losses especially among hogs and sheep. If your hogs are sick or not thriving as they should, you can do no wiser thing than to accept my liberal offer—

I Guarantee to Stop Your Worm Losses or No Pay

I consider **Sal-Vet** the greatest aid to stockmen, feeders and farmers who want to keep animals free from worms — and in the pink of condition — which means protection against diseases, quicker growth, larger profits. No dosing, drenching or starving—animals doctor themselves.

Just Send This Coupon—No Money

All I ask you to do is to fill out the coupon at right. Tell me how many head of stock you have, and I'll ship you enough **Sal-Vet** to last all your stock 60 days. You simply pay the freight charges when it arrives and when the 60 days are up, report results. If the **Sal-Vet** I send you fails to do just what I claim, I'll cancel the charge—you won't owe me a single penny. Send the coupon now.

LET US TAN YOUR HIDE.

Cattle or Horse hide, Calf, Dog, Deer or any kind of skin with hair or fur on. **We tan and finish them right;** make them into coats (for men and women), robes, rugs or gloves when ordered.

Your fur goods will cost you less than to buy them, and be worth more. **Our illustrated catalog** gives a lot of information which every stock raiser should have, but we never send out this valuable book except upon request.

It tells how to take off and care for hides; how and when **we pay the freight both ways;** about our safe dyeing process which is a tremendous advantage to the customer, especially on **horse hides and calf skins;** about the fur goods and game trophies we sell, taxidermy, etc. If you want a copy send us your correct address.

The Crosby Frisian Fur Company,
571 Lyell Ave., Rochester, N. Y.

A FARMER'S GARDEN

Helps his wife to plan her table in busy times. Saves work and worry, saves buying so much meat, gives better satisfaction to the help. A good garden will be almost impossible in your busy life without proper tools. They cost little and save much hard work.

IRON AGE WHEEL HOES AND DRILLS

will sow, cultivate, ridge, furrow, etc., better than you can with old-fashioned tools and ten times quicker. A woman, boy or girl can do it. Can plant closer and work these hand tools while the horses rest. 38 combinations from which to choose at $2.50 to $12. One combined tool will do all of the work. Ask your dealer to show them and write us for booklet, "Gardening With Modern Tools" and "Iron Age Farm and Garden News" both free.

LIVE STOCK REPORTS.

I have the honor of being vice-president of the only truly coöperative creamery in our State. We have been operating for the past 16 months very sueeessfully. We are growing some good corn here, and with our fine Alfalfa, good water and fine mild elimate, this is an ideal dairy country. We paid, at the creamery, 31 eents per pound for butterfat in the month of Deeember last. Alfalfa is selling at $5 per ton. I. B.

Nampa, Idaho.

We have had up to this date (Jan. 20) a very mild open Winter, and stoek is in fine condition. Priees about as follows: Hogs, $8 to $8.10; cattle, mileh cows with ealves, $40 to $70; feeding cattle from $6 up. There are no sales of sheep, as the lambing season is now on, and no horses or mules are offered for sale yet. The buyers get their stoek from Illinois and Iowa, and have them on sale through March and April. Wheat is about 92; corn, 65; hay, $12 to $15 as to quality. Clover seed from $7 to $8; veal ealves from $9 to $10.50 per 100. Turkeys, 15; chickens, 10 and 12; eggs, 25; butter, 25; creamery pays 32. Tobaeco has a splendid crop, and the price good; some have sold at 17 and 18 cents all around. Growing wheat looks fine. Lots of Fall plowing has been done.

Brookville, Ind. T. A. M.

Cows from $40 to $150 eaeh if new mileh. Oxen of about seven feet girth around $275 per pair. Hogs dressed 11 and 12 eents per pound. Butter 30; eggs 30; potatoes 60; eabbage 1½ eents per pound. Apples, No. 1 and No. 2, $2.50 per barrel, very scaree in this seetion. Sweet eorn to ean at the factory 2½ cents per pound. Very little young stock raised, calves too high. In the last 50 years fully one half of the farms have been abandoned (left to grow up) in this part of York county; others will soon follow (in spite of printer's ink of the back-to-the-landers). We have exeellent land for fruit and crops of all kinds, but hard to cultivate, rocky and hilly. It has raised lots of stalwart people, loeated from Portland, Maine, to Portland, Oregon, and would do it now if it only had some one to tickle it with plow and hoe.

Maine. S. W. B.

Wheat, 85; buckwheat, 85; rye, 70; oats, 45; eorn on cob, 75 cents per 100 pounds; shelled, 65; potatoes, 75 cents a bushel, 60 pounds; apples, $1 a bushel (good quality); beef, dressed, eareass, 12 to 14; same on hoof, eight to 10; at retail, 16 to 20; pork, live, eight; same dressed, 12; poultry, live, 14, dressed, 16; mileh eows, $60 to $100; ealves, live, 9½ to 10; milk delivered to ereamery by farmers, 4½ cents a quart; eggs, mixed eolors, brought in by farmers, fresh, 34; butter, dairy, 36; horses from $50 to $250; hay, No. 1 Timothy, $14 to $15; rye straw, long, $13 per ton, bearded, $1 extra; wheat bran, $28 per ton; mixed feed, $30; beet pulp, $27; dry brewers' grains, $27; molasses feed, $27. All the prices I have mentioned are in open market. Sheep and lambs are limited in numbers. All farm products are plentiful. E. D. M.

Delaware, N. J.

Weather warm and pleasant, no zero weather so far this Winter. Farmers busy dragging the roads, as it is the main topic being discussed everywhere. We may be able to produee a good artiele of any kind, and if no road to haul it to market, we are compelled to sell in the Fall, when the market is crowded, thereby receiving small prices. Sentiment in the rural districts now is much in favor of centralization of schools. Farmers having plenty of hay, and other roughage are not wishing to sell any stock; cattle, five to seven cents; hogs, eight; sheep, $3 to $4.50. Hay, $14 to $16 per ton; corn, 75; wheat, 90. Farmers are organizing farmers' elubs at the school house, and debating topics in relation to the soils and farm life in general, uniting in the buying of lime and fertilizer. Wheat looking fine, covering the ground nicely. Farmers are planning for next Summer's work and farming much better than a few years ago. W. P. E.

Athens, Ohio.

Conditions in Southern Nebraska are very favorable. We have had a very mild Winter, with no storm to speak of since November, when we had about six inches of rain in one week, which came down slowly and all went into the soil, thus giving wheat what it needed to go through the Winter. There is some complaint of wheat heaving out, by freezing and thawing. There is a large acreage of wheat and it is looking fine. The mild Winter is favorable to stock feeding, since there is a shortage of hay. There are fewer hogs than ever before. Hog cholera prevails to some extent, some farmers losing their entire herds. Milch cows, $60 to $100, occasionally one at the latter price; last Spring calves, $20 to $30; good horses, $200 down; hogs, live, $7 to $7.50 per hundred; butcher's cattle, $6 per 100. Hay, $12; corn, 70; oats, 40; wheat, 75; Alfalfa seed, $6; potatoes, 90; butter, 30; eggs, 32; chickens, nine. Real estate (farms) prices not changed, but sales at a standstill. Good farms held at $100 per acre and up. H. M. R.

Fairbury, Neb.

CORTLAND COUNTY FARM NEWS.

We have had the coldest weather for six years. As a result of weather favorable for the work, several creameries have already filled their icehouses with ice of unusually fine quality, clear as glass and 10 inches to one foot thick. The ice harvest at Little York Lake began this week. This work engages a large number of men, the first day's output being 60 carloads. The Little York Ice Co. has the contract for filling the Lackawanna icehouses on both the Syracuse and Utica divisions, the house at Chenango Forks being the largest. The work usually lasts four to six weeks. The equipment is most efficient and modern, the greatest difficulty benig to secure cars fast enough to handle the product.

About 50 of the most progressive potato growers of the county met at the office of the Cortland County Farm Bureau recently and organized a Potato Growers' Association. Prof. J. L. Stone, head of the farm corps department of Cornell University, was present and talked very interestingly and instructively on potato growing. Every farmer present was genuinely interested and it is hoped to make the organization a means of much improvement. Another meeting will be held this week.

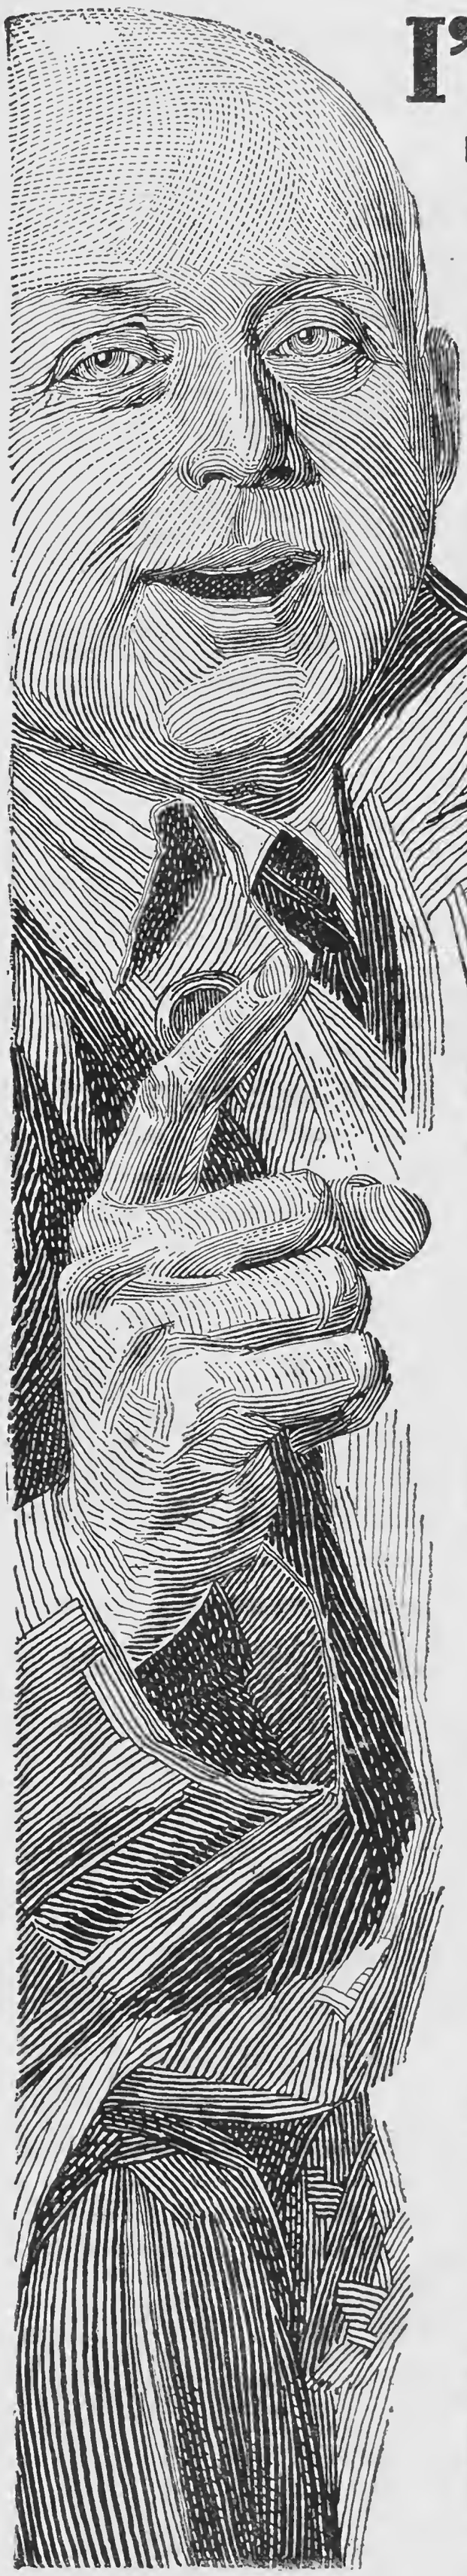
Our county sees many great auction sales of fine dairy cows. One of the greatest in number of cows to be sold will be held on the J. E. Crittenden farm near Willet, January 29, when 184 head of cattle will be sold. This is one of the largest farms in the country, and the sale will include a large equipment of fancy farm tools.

The stock on the well-known Peck dairy farm was moved into its new barn last week. This barn is a marvel of quick construction, having been built in 60 days from the burning of the great barn which required the whole of last Summer to build. The latter barn was only just completed, the workmen's tools, some of them, having not as yet been removed when it burned, with all its fodder for the year. The loss was estimated at $18,000, over and above a reasonable amount of insurance, which was carried on it, something like $40,000. A deplorable feature of the conflagation, which was supposed to be incendiary, was the destruction of 26 head of valuable cattle, including two bulls valued at $3,000 each. The new barn is entirely fireproof, or as nearly so as can be. The lower story is of cement construction, the next one of hollow tile, and the top of brick, with a roof of fireproof material. The new barn will furnish quarters for about 200 head, instead of the 300 housed by the one destroyed. E. G. F.

THE BUFFALO MARKETS.

The Winter season shows to the city authorities and the poor market people the good and bad points of the new Chippewa market, now just fairly finished. The good things in it are sufficiently apparent to decide the city to rebuild the Broadway market in a somewhat elaborate fashion also. At the same time the long east side, which is provided with roof only, is not habitable in severe weather, and must be provided with booths of some sort. The market has about 250 tenants, of whom about 50 are butchers and the others produce dealers. There is well towards a mile of booth frontage.

Potatoes are weak, sometimes being sold as low as 75 cents a bushel to the consumer, the price to retailers running to 85 cents for best grades. The quality is generally good. New red Bermudas are $6 a barrel down, to retailers, and sweet potatoes $1.25 a hamper down. This is the best season for Winter apples, some dealers selling nothing else at this time of the year, carrying both eastern and western fancy to common stock, including Palouse or Spitzenburg, Bellflower, Spy, Grimes Golden, Baldwin, Tallman, Wagner, at 12 to 15 cents a two-quart measure, sometimes selling to grocers at the same rate per bushel. The class of green stuff, except celery, that farmers keep in a pit and open every day when needed, is still pretty cheap. It includes vegetable oyster at five cents a bunch, carrots, leeks, about the same and parsnips, beets and onions in small measures at five to seven cents. Cabbage is not as plentiful accordingly as cauliflower, being 2½ cents a pound and cauliflower 12 cents a head up and in fine color. Celery improves very slowly, as it has been burned in storage or in transit. Bunches are small at five to 10 cents each, to consumers. Lettuce is more plentiful than usual, small heads retailing at five cents and large ones at 10. Endive is more plenty than formerly, but is not much known yet, cucumbers have about disappeared. There is an occasional egg plant at fancy prices. Winter squash has run low early, as the crop was poor and decayed much faster than if it had been more mature. It sells at about four cents a pound to consumers. There is a good showing of green beans at 20 cents a quart and spinach at 25 cents a peek, both in fine quality. Both butter and eggs are somewhat lower, butter not being quoted at more than 36 cents to the retailer and eggs, with offerings increasing, now differ not more than five cents a dozen between fresh and the better storage grades, the average to consumers being 34 to 39 cents. There is a storage grade that is enough lower to make it open to suspicion. J. W. C.



I'll Put Your Stock in a Thriving Condition—

Make the Ailing Ones Healthy and Expel the Worms

GILBERT HESS,
Doctor of Veterinary Science
Doctor of Medicine

U. S. Dispensatory Medical Colleges Noted Veterinarians

All certify the ingredients of Dr. Hess Stock Tonic to do just what I claim for them.

Nux Vomica. Digestive and Nerve Tonic.
Quassia. Digestive Tonic and Worm Expeller.
Sulphate of Iron. Blood Builder and Worm Expeller.
Sulphate of Soda. Laxative and Liver Tonic.
Common Salt. Appetizer and Expels Worms.
Epsom Salts. Laxative.
Nitrate of Potash. Stimulates Kidneys.
Charcoal. Prevents Noxious Gases.
Fenugreek. Tonic and Aromatic.

The above is carefully compounded by Dr. Hess (M. D., D. V. S.), with just enough cereal meal to make a perfect mixture.

I URGE every farmer to see to it right now that his work horses are put in condition for the hard work of spring and summer, so that when the sun shines your horses will be rid of their old coats, full of stamina and ready for business.

And don't overlook the spring pig crop—the mortgage lifters. Start them off free from disease—free from worms.

Be sure, also, that your milk cows are thoroughly conditioned for the long, heavy milking season, and that those with calf are vigorous and fit.

Remember, your stock have been cooped up for the last few months and have been on dry feed. As corn or oats, hay and fodder do not contain the laxatives and tonics so abundantly supplied in grass, your stock are pretty apt to be out of fix. Some of your animals are liable to be constipated, rough in hair, their legs may have become stocked, or they have dropsical swellings, but the most common disease of all, especially among hogs, is worms—worms.

Dr. Hess Stock Tonic

A Splendid Conditioner—A Sure Worm Expeller

Being both a doctor of medicine and a doctor of veterinary science, I know exactly what farm stock need to get them in condition for spring.

In my left hand I hold the formula of Dr. Hess Stock Tonic—showing every ingredient, what each ingredient is for, and you will notice that the U. S. Dispensatory—one of the world's greatest authorities—certifies these ingredients to do as I claim.

Look these ingredients over—*Tonics* to improve the appetite—*Blood Builders* to enrich and tone up the blood—*Laxatives* to regulate the bowels and *Vermifuges* to expel worms. I want to emphasize one fact as forcefully as I know how: Dr. Hess Stock Tonic will not only *rid your stock of worms,* but will put them in a condition *unfavorable to worm development.*

Remember, it's the cow in the pink of condition that fills the milk pail—the horse that digests his dinner that pulls on the bit—the steer with an appetite that lays on fat, and the hog that is well and free from worms that gets to be a 200-pounder in 6 months.

So sure am I that Dr. Hess Stock Tonic will put your animals in a thriving condition, make the ailing ones healthy and expel worms, that I have authorized your dealer to supply you with enough for all your stock, and if it does not do as I claim, return the empty packages and get your money back.

Now, listen, Dr. Hess Stock Tonic is never sold by peddlers, but only by reliable dealers whom you know. I save you the peddler's salary and wagon and team expenses, as these prices prove: 25-lb. pail $1.60; 100-lb. sack $5.00. Smaller packages as low as 50c. Except in Canada, the far West and the South.

Write for Free Stock Book—It's a Stunner

DR. HESS & CLARK, Ashland, Ohio

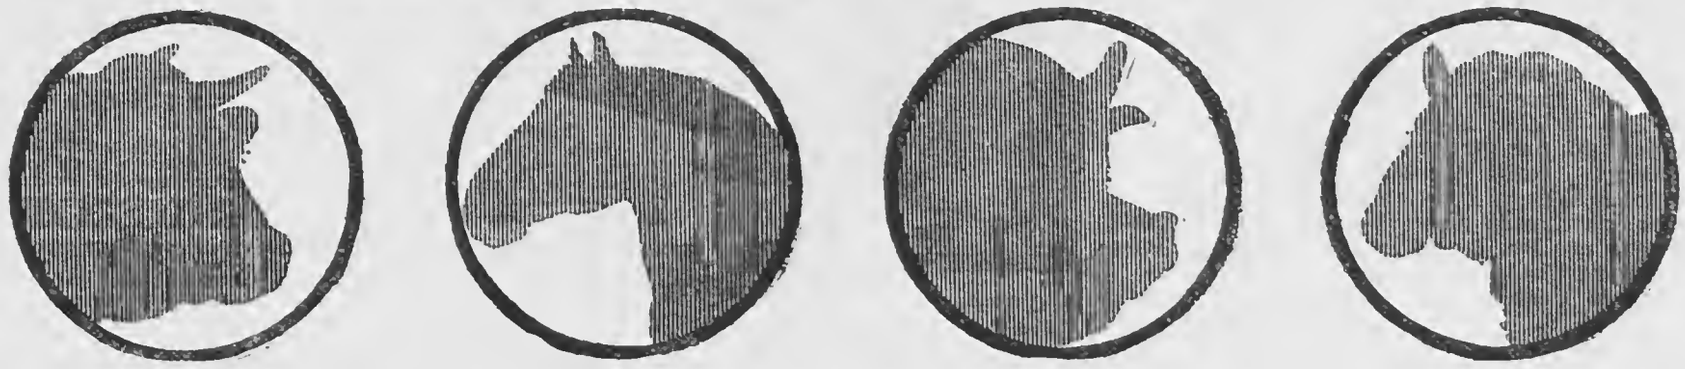
Dr. Hess Poultry Pan-a-ce-a

Makes Poultry Healthy *Makes Hens Lay*

This is a splendid tonic—it tones up the dormant egg organs and compels each hen to lay regularly. It also helps chicks grow and shortens the moulting period. It is a sure preventive against Roup, Gapes and Cholera. Costs but a penny a day to feed 30 fowls. Sold on my liberal Money-Back Guarantee. 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail $2.50. Except in Canada and the far West.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks; or, if you will keep it in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes, etc. Comes in handy sifting-top can. 1 lb. 25c; 3 lbs. 60c. Except in Canada and the far West. Guaranteed.



FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

Dairy Ration With Buckwheat.

Will you give me a balanced ration for a milch cow when using buckwheat middlings? F. E. W.

If your cows are getting the ordinary mixed hay, corn fodder, and silage of most New York farms, as their roughage, a good grain ration to go with them might be composed of equal parts by weight of cornmeal, wheat feed, and buckwheat middlings. Ground oats might replace all or part of the cornmeal in this ration, and it would be made somewhat richer in protein if a portion of the buckwheat middlings was replaced by cottonseed meal. Such a combination as this, for instance, 50 pounds cornmeal; 50 pounds ground oats; 100 pounds mixed wheat feed; 75 pounds buckwheat middlings; and 25 pounds cottonseed meal. There is no end to the combinations that could be made, and those feeds which furnish the required food elements in cheapest form should, as a rule, be chosen. Buckwheat middlings is one of the best, and usually in this State, one of the cheapest of the high protein feeds. M. B. D.

Cottonseed and Wheat Bran.

Will you give a balanced ration for dairy cows from the following feedstuffs: Clover and Timothy hay, shredded fodder, corn silage, oil meal and cottonseed? How many pints of oil meal and cottonseed, testing 35 and 41% protein respectively, should be fed for cow? Which is the cheaper feed, wheat bran at $26 or cottonseed at $36? Is it necessary to feed bran to receive a big flow of milk?
Ohio. R. C. C.

You seem to have an abundant variety of roughage and a lack of variety for the grain ration. You will necessarily have to feed your cottonseed and oil meal mixed with silage, or you can purchase bran, dried brewers' grains or dried distillers' grains to lighten up the grain ration and furnish the required bulk. You will find it is more accurate to weigh your grain rations instead of measuring by the pint. A good-sized cow in full flow of milk should be able to eat one pound of oil meal, three pounds of cottonseed and five pounds of wheat bran or dried brewers' grains. Cottonseed meal is cheaper at $36 than wheat bran is at $26 per ton. It is certainly not necessary to feed wheat bran in order to get a large flow of milk. You can get just as good results or even better results with dried brewers' or distillers' grains, which furnish bulk to the ration as well. With this grain ration you should feed a liberal allowance of silage twice a day, with hay or corn fodder at noon, the grain ration to be divided into two feeds for morning and night. C. S. G.

Improving a Ration.

Will you please tell me if I am feeding the following feeds to best advantage? I mix 200 pounds wheat bran, 200 pounds dried grain, 200 pounds cob meal and oats ground. Should I add 100 pounds of linseed or cottonseed meal at $2 per 100? I feed oats on straw and corn fodder as roughage. Does it pay to feed oats on straw? Would beet pulp be good dry? Cows have water in manger all times. I feed about six to eight quarts per feed twice daily. Is that enough for cows in milk? H. A. D.
New Jersey.

You are feeding plenty of feed, but you could add 100 pounds each of cottonseed and oil meal to your mixture to good advantage. In order to get the full benefit from beet pulp it should be soaked, but it may be fed dry with fairly good results. Oats should be ground for cow feed in order to make them more digestible. You cannot expect a very large flow of milk when cows are fed straw and corn fodder for roughage. Cows require good early cut mixed or clover hay or Alfalfa or silage in order to produce a good flow of milk profitably. C. S. G.

Ration With Beet Pulp.

Will you give me a good feed with beet pulp and with malt sprouts for cows in all stages of lactation? Most of them have been coming fresh since the first part of September up to the present time. I sell my milk and would like to get as big a flow as possible. Beet pulp costs $1.50 per cwt.; sprouts $1.30; bran $1.30; middlings $1.50. I can get cottonseed meal, oil meal and gluten. At present I feed wheat bran, middlings and cornmeal to all of my cows; half of them I feed sprouts and the other half beet pulp. I give them clover and Timothy hay and cornstalks and Alfalfa hay once a day. Could you tell me where I could buy Alfalfa a little cheaper than $27 per ton, as that is what it costs me now, and I can get No. 1 cow hay, clover and Timothy at $18 per ton. M. T.
New Jersey.

I would recommend four pounds beet pulp, two pounds cottonseed meal, four pounds dried brewers' grains, and two pounds cornmeal. Feed as much of this mixture as your cows require to produce the desired flow of milk. My experience with malt sprouts has not been very satisfactory, as they failed to produce the results which were obtained by feeding dried beet pulp and dried brewers' grains. I cannot see why you should feed oil meal with dried beet pulp, as it is too expensive to feed unless it is required as a laxative as a rule. Cows which have a good supply of soaked beet pulp do not require any other laxative feed, the greatest objection to the use of the oil meal being its cost. The ration given above will produce a good flow of milk, but no cottonseed or cornmeal should be fed to cows within two weeks after they freshen. The price you are paying for Alfalfa hay seems to be about the market price, and I do not know where you can buy it any cheaper. C. S. G.

Bean Pods for Cows.

I have a quantity of bean pods. Will it be safe to feed them to my cows that are due to freshen in March and April? I have never fed any. Some of my neighbors tell me they are good for cows.
Newfield, N. Y. R. W. B.

Bean pods may safely be fed to cows at any time. They are relished by cows, and contain considerable more nourishment than Timothy hay or corn fodder. If not fed in too large a quantity cattle will waste but a comparatively small amount of bean fodder, although it looks hard and unappetizing. C. L. M.

ROOTS FOR COWS.—On page 98 I saw an inquiry signed J. W. F., Delaware, asking whether beets and carrots can be fed to cows without making the milk taste. I worked for one man over 40 years, and fed all kinds of vegetables, and never had any trouble with milk being flavored. There is nothing better for cattle than good sugar beets and carrots. Carrots are good for horses, and why not for cows? If you want a large flow of milk, there is nothing that I ever found equal to cabbage, to be fed just as soon as milking is finished, never before. If given before it will spoil the milk. I have fed a bushel basketful to each cow at one feed, and never spoiled any milk.
Rhode Island. J. H. A.

DE LAVAL

Butter Triumphs as Usual At National Dairy Show

BUTTER made from cream separated by De Laval Separators made the usual clean sweep of all highest awards at the great 1913 Chicago National Dairy Show and Annual Convention of the National Butter-makers' Association, just as it has always done every year since the organization of the National Association in 1892.

Whole Milk Creamery Butter. The highest score in this class was awarded to O. N. Peterson, of Rapidan, Minn., a De Laval user, as were 187 out of the 200 whole milk creamery entries.

Gathered Cream Creamery Butter. The highest score in the gathered cream factory-made butter class was given R. O. Brye, of the Readstown Creamery Co., Readstown, Wis., this prize-winning butter being made from the cream of farm patrons all using De Laval Separators.

Farm Dairy Butter. The highest score in this class was awarded to Mrs. D. H. Turnbull, of Monmouth, Ill., whose family has been using De Laval Cream Separators for over twenty years.

De Laval Superiority Indisputable. The evidence of the superiority of De Laval cream and butter as demonstrated by the winning of all highest awards the world over for thirty years, is so overwhelming as to be indisputable and unanswerable. A De Laval catalog, to be had for the asking, will make plain the reasons for it.

Phelps' Book Is Yours For The Asking

Every Buggy Sold on 30 Days' FREE Trial
Absolutely Guaranteed for 2 Full Years

H. C. Phelps, *President*

It Shows You How to Save $25.00 to $40.00

Don't doubt this! Send for this book *and prove* it to yourself! Do that today! It costs you nothing. 200,000 men know *by experience* that this is *so!* They saved at least $25.00 to $40.00 on every buggy they bought *after* they *got Phelps' book.* And they got the best buggies made—just as you will. Buggies made of the finest Second-Growth Hickory—*split*, not sawed. Phelps makes the famous—

SPLIT HICKORY BUGGY

Think of getting a fine buggy—*better* than others your friends pay $25.00 to $40.00 more for. A buggy that will make you the envy of all your fellows. Think of getting it to try out on the road free for 30 days and guaranteed for 2 years! Write for this book today.
And Phelps offers you the choice of an immense number of 1914 buggy styles to choose from. More than 40 local carriage shops "rolled into one" could ever show you. Address,
H. C. Phelps, *President*, The Ohio Carriage Mfg. Co., Station 290, Columbus, Ohio

The Farm Cat.

In these days when so much is being put forth by bird lovers against the cat, it is well to say something in favor of this animal. A good cat is practically the only effectual way to keep down mice in a barn, warehouse or any place where grains, hay, and other feed stuffs are stored. The good cat—that's the question! My own experience is that the only one is an emasculated male. He is always at home and with me is on his job, and woe betide the night serenader who comes up against him, for he is always sleek and fat, and weighs from 10 to 12 pounds. But this is not all. He should be trained. Much can be done along this line. If a cat is praised and petted when it catches a mouse or rat, and scolded when he catches a bird, and if possible has the bird taken away, he will soon learn to know the difference. He may also be taught to help in hunting about the barn. We have such a cat. He was about the most despicable-looking thing in the cat line I ever saw. He soon developed into as handsome a cat as one could wish. During the Summer he brings in from one to a half dozen field mice a day. Frequently he will not eat one until he has showed it to us and been praised for it. Only a few night ago he brought in one after we had retired, and kept up his "meous" until he had been told: "Good cat, Tip." A female cat makes a good mouser, but when she has a half dozen kittens to nurse is apt to catch chickens, and do other naughty things, besides; one's cat family is apt to increase too fast. The practice of dumping surplus cats on other people or out in the woods cannot be too strongly condemned on the ground of cruelty as well as making them a nuisance to the community. S.

Oregon

Struggle With a Florida Horse.

I am pleased with your advice about coming to Florida. I have been here four years, and like it very much, but I spent $100 and six weeks' time looking round before locating. As for poultry raising, feeds are higher and eggs and chickens cheaper than in the North.

The article on "The Cast Horse," on page 101, reminds me of how I have just saved my 12-year-old mare. She had been getting very thin, and finally caught a foot under a root in edge of lake and laid several hours. I got help and rolled her over and over a dozen times out to hard ground, and worked over her for near 24 hours, but could not get her up. Neighbors all said it was no use. Then I cut four small trees and made stout poles 11 feet long, bored hole in small ends and put a one-half-inch bolt 12 inches long through them; set this up over horse with the butts in a square of about six feet. I nailed two boards across six feet from ground, and laid two boards on these for a floor. I took three-inch belt off gasoline engine and nailed ends to each end of a 2x4 30 inches long; laid middle of belt over middle of 2x4, and passed the two bights of belt under horse and over ends of another 2x4. This gave four widths of belt to carry her weight. I used plow lines for breeching and breast strap, hitched one end of a long-linked trace chain to middle of each 2x4, driving nails so belt and chain could not slip out of place. Then I mounted the floor, and with a piece f tire iron for a lever through the links of the chains, passed up between the two floor boards, very easily raised her, one link at a time. When part the way up she began to struggle hard, but the bolt through top of poles held them firm, and she was soon on her feet, and after feeding and rubbing her legs, was able to walk to barn. I had her teeth filed, and she is getting strong again.

When I got her three years ago she would not plow; would do anything else, but when she found a plow behind her, would back, and if we didn't pull the plow back would tangle up in the chains and fall down. After much advice and many failures I cured her very easily. I tied a piece of cord to one hame, then back under her tail, crupper-like, then through ring in other hame, and tied the other end to plow handle. When she began to back I pulled on the cord. She stopped and looked back to see what the matter was, then she tried to back again with same result. In half an hour she was cured, and never backs now unless I ask her to. A small pulley would be better than the hame-ring, but I didn't find it neeessary. A. G. K.

Winter Haven, Fla.

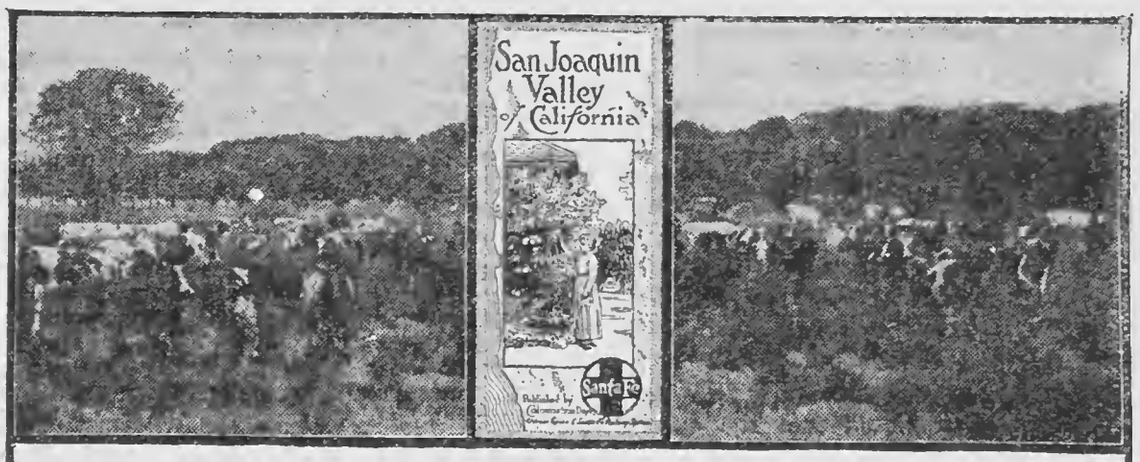
Farming in Tioga County, N. Y.

I would like your opinion regarding a Michigan farmer locating in Tioga Co., N. Y. My means are limited. Would you suggest investing in sheep, cows, or both? What would be one year's profit from 100 sheep, provided one raised all the feed? A. H. G.

Covert, Mich.

As a lifelong resident of Tioga County, N. Y., I should be glad to welcome you "into our midst." This county has many good farms that can be bought at very reasonable prices, and that will well repay any amount of energy, brains, and capital, that are likely to be invested in them. Incidentally, also, it has some farms that would compel a jack rabbit to take Summer boarders in order to support his family. If you have a reasonable amount of capacity; know how to farm, and possess the strength and energy which are absolutely essential to success anywhere. I know of no better opportunities in this State than are offered by Tioga County. On the other hand, if you have an idea that good land here is to be bought for a song, that crops will grow with little attention, and will market themselves, you will be disappointed if you come. Farms are undoubtedly sold here at prices much nearer their potential value than are those of the Middle West, but potential value is not realized value, and he who realizes upon these farms will do it by hard work, hard sense, and hard thinking.

Markets for the production from both cows and sheep are good here, and money is made from both; as well as lost in both. Despite the many glowing accounts of what should be, might be, and possibly, sometime, may be, the margin of profit in live-stock growing in this State is very small, and if it were not for the value of their by-products in maintaining soil fertility, cattle of all kinds would be much fewer in number than they are now. Whether sheep, or cows, or both, should be kept upon a farm depends upon the farm and the farmer; without knowing both, no definite advice of value could be given. A neighbor who is a good farmer, upon a good farm, and has always kept sheep, tells me that under present conditions they should net from $2 to $3 each per year. It has been a common custom to reckon 10 sheep as about equivalent to one cow in cost of keeping, and probably the profits now might be fairly reckoned upon the same basis. M. B. D.



100,000 Families will move to California

within two years.

That is a conservative estimate. Thousands of people are making their plans to go to California during the great Expositions, and many will remain. By the end of 1915 the price of a good farm in the fertile San Joaquin Valley will have greatly advanced.

This is the carefully considered conclusion of those having the greatest possible information on the subject.

Where is the man who does not want a California home? Now is the time to get it. You can buy choice land of proven fertility and proven adaptability for a price that will never be lower. You can get it on terms that will allow you to make most of the payments out of the land itself. By developing now you should earn big profits on the farm and a heavy dividend on the advanced value within a period of three years.

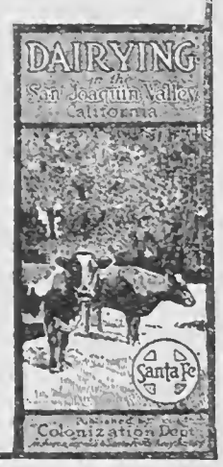
There is no space here to tell you of the wonders of the San Joaquin Valley. That is why we urge you to send to-day for our books describing in detail the valley as a whole and the special industries, "Dairying" and "Poultry-raising," which have proven so profitable as major crops or as quick money-getters until an orchard can be developed.

You are under no obligation to go further; but you will get much information that must be of value to you if you will write for these books to-day and read them carefully. Then, if you wish, I will be glad to give you first-hand information about the several sections of the valley, the value of the land, the crops best adapted to the various sections, and anything else that you care to know.

I also will tell you of the work of the Santa Fe Agricultural Department, which furnishes expert advice to those who are on the ground, and this without charge.

A post card will bring the books.

C. L. Seagraves,
General Colonization Agent, Atchison, Topeka & Santa Fe Railway, 2209 Railway Exchange, Chicago.



DAIRY FARMERS WANTED

THE Southeastern States need more milk, cream and butter producers. Each year $32,500,000 worth of Northern dairy products are shipped into the South. You can make money in this many crop, all the year-grazing country. Ample rain, (irrigation unnecessary) mild winters and pleasant summers make living enjoyable and highly profitable.

GOOD LAND $15 AN ACRE UP

produces heavy yields of alfalfa, clover, corn, wheat, fruit and truck. Profitable local markets greater than supply.

Alfalfa booklet, the "Southern Field" magazine and facts about dairying along the Southern Ry., M. & O. R. R. and Ga. So. & Fla. Ry., sent on request.

Cheap enough. Mild climate. For information write State Board of Agriculture, Dover, Delaware

1913 RECORD Magnificent Crops in all Western Canada

All parts of the Provinces of Manitoba, Saskatchewan and Alberta, have produced wonderful yields of Wheat, Oats, Barley and Flax. Wheat graded from Contract to No. 1 Hard, weighed heavy and yielded from 20 to 45 bushels per acre; 22 bushels was about the total average. Mixed Farming may be considered fully as profitable an industry as grain raising. The excellent grasses full of nutrition, are the only food required either for beef or dairy purposes. In 1912, at Chicago, Western Canada carried off the Championship for beef steer. Good schools, markets convenient, climate excellent. For the homesteader, the man who wishes to farm extensively, or the investor, Canada offers the biggest opportunity of any place on the continent.

Apply for descriptive literature and reduced railway rates to Superintendent of Immigration, Ottawa, Canada, or to Canadian Government Agent.

FEEDING Empire MOLASSES 12½¢
TRADE MARK REGISTERED

One pound of molasses to ten pounds of feed increases efficiency of ration 25 per cent. Try it. Cut price $7.00 per barrel (56 gallons), f. o. b. Pennsylvania Factory. You take no risk—money back if not satisfied after feeding half a barrel. Order quick. WATTLES & COMPANY, Box 15 Litchfield, Michigan

AILING ANIMALS.

Lameness.

I have bought a horse six years old. He is hurt in his front ankle. He stepped on a round stone and threw his ankle forward so that it stands out on his hoof in a big bunch. He did it a month ago. J. M.

A boot and brace should be made by the harness maker to keep the fetlock joint in place. Hand rub the part three times daily and then put on the boot. If that plan does not succeed it may be that a veterinarian would find the operation of tenotomy (cutting of the tendons) the right treatment in this condition. It perfectly succeeds in many cases of knuckling. A. S. A.

Indigestion.

I have a horse 15 or 16 years old, which was in good flesh last Spring, but after being on pasture for a couple of months, it went down considerably, notwithstanding the fact that it was fed four quarts of oats morning and evening. I have been feeding it commercial feeds, but it does not seem to pick up. When in good flesh it weighs about 1,100 pounds. It does not seem to digest oats properly, which is one reason I have been feeding it soft feed. F. J. K.
Pennsylvania.

Have the teeth attended to by a qualified veterinarian, as the old horse cannot properly masticate feed. Then feed whole oats and wheat bran along with the best of hay, and if possible add carrots. Allow one pound of oats for each hundred pounds of body weight, and a like amount of hay as a day's ration, and increase the feed slightly as improvement takes place. Make the horse work every day, or at least take abundant exercise every day. If the coat is long and coarse, either clip the horse or remove the hair from the belly and from the legs above knees and hocks. A. S. A.

Warm Water for Fresh Cow.

Is it necessary to give a cow that has just freshened warm water for drinking, for two or three days, or is cold water just as good? A. S.
New York.

It is not necessary; but it is thought best to at least take the chill off the drinking water. Certainly ice cold water should not be offered. It is usual to give the newly calved cow a drink of bran, and oatmeal in warm water well sweetened with molasses. This is good for her, strengthening and laxative. A. S. A.

Fistula.

I have a horse seven years old that has been treated by local physicians. He has a sore on his lower jaw which opens and runs every two weeks. The veterinarian told me to burn it with caustic. I burned it three times and it does no good. He has had this sore two years. It does not bother him in eating and his teeth are all solid. I cannot find any hole in jaw bone. What can be done for it? H. F.
Ohio.

Home treatment will not avail in such a case of fistula. The discharging pipe connects with the salivary duct (Steno's) or with a diseased molar tooth, or with diseased jawbone. Such a case should be placed in a veterinary hospital for surgical treatment. A. S. A.

Swollen Knee.

My horse has a swollen knee caused by hitting on the manger. What can be done for it? M. O.
New Jersey.

If the swelling has been there for some time, and has become hard and does not lessen in size when the horse takes plenty of exercise, it is unlikely that treatment will do much good. Make it impossible for the horse to further bruise the knee. Clip off the hair and each other day give the joint a thorough rubbing with oleate of mercury. A. S. A.

Malignant Œdema.

January 1 my filly had a swelling along the side of face from the angle of the mouth to about the second molar about two inches in diameter. January 2 swelling involved both sides and face, jaws partly open, tongue protruding and swollen. By night head was enormously swollen clear to the neck, sloughing of mucous membrane, very bad odor; January 3, morning, dead. She was with other colts in a covered yard; had hay, straw, corn fodder and grain in good condition. There was no other swelling, and she was apparently all right December 31. Can you tell me the disease and remedy?
New York. W. W. C.

A scratch or wound became invaded by the germs which cause malignant œdema and death resulted. The swellings should have been scarified at once, swabbed with disinfectant, especially tincture of iodine, and the tincture might also have been injected into the tissues. Quinine should have been given internally along with stimulant, but such cases generally prove fatal. A. S. A.

Supernumerary Teat.

I have a three-year-old heifer coming fresh, second calf, in March. She has a double teat with two openings, one one-half inch shorter than the other. It makes it disagreeable to milk. Will you advise me about this? How long should she go dry? F. J. S.
Ohio.

The heifer should go dry for six weeks before calving and during that time a qualified veterinarian might obliterate the duct in the small teat; but this cannot safely be done when the heifer is giving milk, nor should such an operation be attempted by the owner. A. S. A.

Lameness.

I have a horse that is in fine condition, about eight years old, but is lame in his left hind leg. There are hard lumps in joints. He has been this way for quite a while. He hitches or hops when made to trot, but does not go very lame when walking. What is best to do for him?
Long Island. H. S. L.

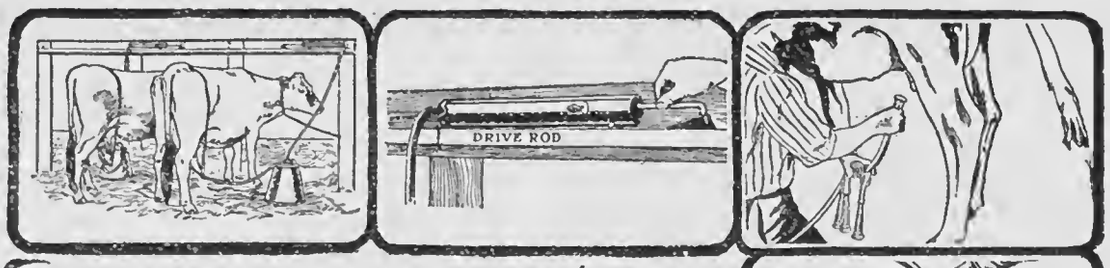
Bone spavin and ringbone appear to be present and a graduate veterinarian should be employed to fire and blister the parts. Then give the horse at least six weeks of absolute rest tied up in a narrow stall. A. S. A.

Training Dog to Harness.

I have a three-year-old Saint Bernard dog which I would like to train pulling a small wagon for the children, but have been told the dog is too old and must be altered, and should buy a billy goat. Do you think the dog could be trained? Could I use a milch goat for that purpose, or must it be a billy? E. G.
New Jersey.

The dog may be successfully trained and should not be altered. That operation will make him a fat, sluggish, good-for-nothing animated doormat. An altered goat makes a good harness animal for children, but don't use a billy or milch goat. A. S. A.

PAT and Mike had got half way around the menagerie tent when they came to an opening marked "exit." "Wonder what kind of a baste that is?" said Pat. "We'll go in and see, anyhow," said Mike, and next moment they found themselves out under the stars.—Boston Transcript.



This Gives the Hand-like Squeeze

The HINMAN PUMP produces vacuum gradually and applies it to the teats with a gentle hand-like action. Complete vacuum break 45 times a minute. Vacuum in cylinder—not in pail. No possible danger of cows getting too strong suction. Easily adjusted to hard or easy milkers. The cows like it and "give down" naturally.

Six years experience has enabled us perfect a slow-speed, small-diameter, long-stroke, movable pump. A marvel in durability. Requires little power to operate.

The HINMAN Milker

Noiseless; has a simple method of keeping record of each cow's milk; each machine separate; quick pail-changing idea; visible milk flow; no piping—just a simple drive rod; only two moving parts. These features are found only in the Hinman. Over 50,000 cows milked daily. It pays for 10 cows. Agents everywhere.

NATIONAL FIRE PROOFING COMPANY, Syracuse, N. Y.

The Henyard.

THE EGG-LAYING CONTEST.

The tenth week 851 eggs were laid, 25 less than last week. The White Leghorns are the ones responsible for these losses; 25 pens, 250 birds, produced only 66 eggs in a week; 10 of these pens did not produce an egg. The other eight pens of White Leghorns laid only 170 eggs, a fraction over two eggs each in the week. Leghorns are not living up to their reputation as Winter layers, obtained in previous contests, but they will be shelling out eggs later when the other breeds are broody.

In the home yards of White Leghorn breeders all about me, there has been a similar falling off. As housing and food are the same as before, it must be or at least it is reasonable to suppose, that weather conditions are more or less responsible for the poor showing. But here comes in the pertinent inquiry, why do not the same weather conditions also affect the egg output of the White Wyandottes, the R. I. Reds, etc.? If anyone can answer this I would be glad to have him, I confess that I cannot, except on the supposition that Leghorns are more susceptible to weather conditions than the larger breeds. Tom Barron's White Wyandottes outlaid all other pens again, as they have for six consecutive weeks. Their output for the week was 51, and their total to date 396.

Merrythought Farm White Wyandottes are second with a score of 37, and Dearborn & Sharpe's S. C. Reds are third with a record of 33. White Leghorns come in fourth, the pen from Storrs Agricultural Station laying 31. Below are some of the scores made during the week, and the totals:

The White Laced Red Cornish and the Silver Campines have not laid as yet

GEO. A. COSGROVE.

Hens on Strike.

Our hens seem to be on a strike so far this Winter. We received only a few eggs in October and none in November or December. We have about 55 hens and probably 70 pullets, the pullets hatched in March, April and May. All Fall and until the snow came the chickens ran to the stacks, getting barley, wheat, Alfalfa and small amount of millet. Since the snow came we have fed in the houses, cooked barley about eight in the morning. When it warms up we turn into the scratching pens and feed wheat in the straw, not thrashed. We also give them warm skim-milk each morning. At noon we feed sugar beets and at night we feed part corn and part barley. On going to roost at night chickens' crops are well filled. We live 30 miles from town and it is hard to get other feed. Is this feed all right?

Colorado. MRS. J. L. A.

I am afraid that 30 miles from a feed store would put most Eastern poultrymen out of business, and it is evidently a little handicap to you. Your grain rations are a little too wide for best results with poultry; that is, they contain too large a proportion of the fattening elements in food and too little of the egg, milk, and muscle-making elements. Barley, corn, wheat, and millet are all of a fattening nature, and need to be balanced by meat in some form, skim-milk, and the higher protein grain feeds like gluten, oil meal, buckwheat middlings, wheat bran and middlings, dried brewers' grains, etc. Your skim-milk and Alfalfa fall into the high protein class, but your hens eat too little of them in proportion to the other foods that they are getting. If you cannot feed a mash of ground grains containing those rich in protein, perhaps you can procure beef scrap at a reasonable price, or possibly fresh meat of some kind. I would feed all the skim-milk that the hens would eat and replace the sugar beets with Alfalfa leaves, either dry or steamed, as the hens would eat them best. You can in this way at least partially balance your grain ration. M. B. D.

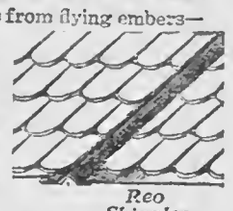
Rock Bottom Prices Roofing for a Lifetime

You can't prevent lightning—you can't prevent ordinary roofs from catching fire from flying embers—but you *can* have a lightning-proof, fire-proof, rust-proof and rot-proof steel roof—one that lasts as long as the building stands. Always beautiful—never needing painting or repairs. Before investing in any kind of roofing, you should learn all about the *one* BEST roofing made.



Reo Shingles

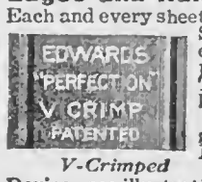
EDWARDS *Tightcote* Reo Steel Shingles

Corrugated **Costs Less! Outwears 3 Ordinary Roofs**

Anyone can lay it—right over old shingles if you wish. No special tools, skill or experience.

Edges and Nail Holes Can Never Rust

Each and every sheet of Edwards Galvanized Reo Steel Shingles, Roofing, Siding, Ceiling or finish is extra heavy galvanized, piece at a time, by our exclusive TIGHTCOTE Process after sheet has been stamped and resquared. Side and edges are as heavily galvanized as body of sheet. No weak spots to rust and corrode. By Edwards Patent Interlocking Device—see illustration below, and note its construction—all nails are driven through underlayer of metal only—no exposed nail holes—no leaks.



V-Crimped

How To Test Galvanizing

Take any other piece of galvanized metal, bend it back and forth three or four times, hammer it down flat each time—then take your finger nail and flake off the loosened galvanizing. Make this test with Edwards TIGHTCOTE Galvanized Steel Roofing—then note that galvanizing is solid to the very edges—no a sign of flaking—not the space of a pin point is exposed to the weather and cannot rust.

Spanish Tile

WORLD'S GREATEST ROOFING BOOK

How many of your chicks live to become layers?

Minimize your losses by feeding H-O Steam-Cooked Chick Feed. It builds up bone, flesh and feathers—turns chicks into sturdy chickens.

The steam-cooking we give it at our mills perfectly prepares the grain for the little chicks' stomachs. Does away with the question of sour grain.

H-O Steam-Cooked Chick Feed

is a scientific mixture of Corn, Cut-Oatmeal, Cracked Wheat, Kaffir Corn, Peas and Millet—*steam-cooked* by a special process in our mill.

Sold only in 10-lb., 25-lb., 50-lb. and 100-lb. bags, with tag showing guaranteed analysis. If you cannot get H-O Steam-Cooked Chick Feed, Intermediate Scratch, Scratch Feed, Poultry Feed, Dry Poultry Mash or Chick Feed from your dealer, write for sample and prices.

R. MacKELLAR'S SONS CO., Peekskill, N. Y.

The Henyard.

Type of White Wyandotte.

Will you give distinguishing marks of White Wyandottes? H. A. F.
Trenton, N. J.

The one distinguishing mark is the comb; this is of the Rose type. In other points they so closely resemble the White Plymouth Rocks as to be undistinguishable from them, save by an expert, and I doubt if any expert would care to risk his reputation in a mixed flock, if he could not see the combs. The plumage is entirely white, the beak, shanks, and toes yellow, and the weight about a pound less than that of the Plymouth Rocks. The contour of the typical Wyandotte differs from that of the typical Plymouth Rock, the latter fowl being more "rangy." This cannot be well shown, however, except by illustration or from life. M. B. D.

Grain Mixture for Hens.

Can you give me a good proportion for the following kind of grain? Bran, hominy, Alfalfa meal, and beef scraps. My hens are Barred P. Rocks. I keep the meal before them all the time and feed wheat in the morning and cracked corn at night. Would you advise feeding gluten with the meal? If so, how much?
H. P. H.

The feeds you mention, alone, would not make a well-balanced ration for hens. I would suggest, instead, 100 pounds each of corn meal (instead of hominy), wheat bran, wheat middlings, gluten feed, and beef scrap. To this, 50 pounds of Alfalfa meal might be added. The somewhat more elaborate Cornell formula is: 60 pounds cornmeal, 60 pounds wheat middlings, 30 pounds wheat bran, 10 pounds Alfalfa meal, 10 pounds oil meal, 50 pounds beef scrap, and one pound of salt. I like gluten as one of the constituents of a dry mash.
M. B. D.

Hens Do Not Lay.

Can you tell me why my hens do not lay? I have 60 White Wyandotte pullets in new house 12x24 feet. They were hatched in early May, grew well and were put into house in September. The house has four windows facing south, one being of muslin. The floor is of natural earth and dry. I feed wheat, corn and oats with grit, shells, charcoal and meat scraps constantly before them as well as fresh water. They are not lousy. They lay only three or four eggs a day. Last year at this time under the same conditions 36 hens laid 18 to 24 eggs per day. A. S. A.
Alstead, N. H.

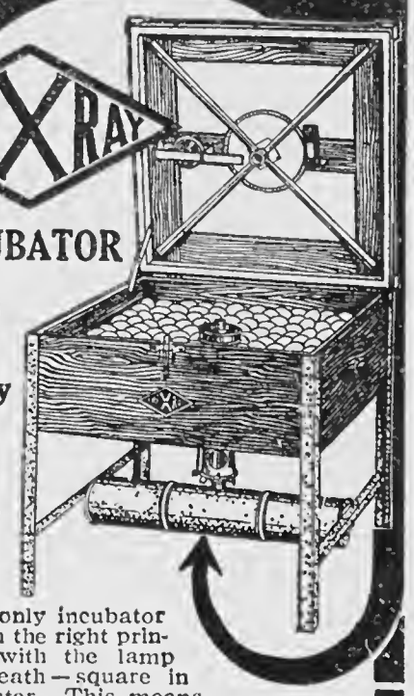
It would be difficult to find an excuse for your pullets under the conditions you describe, though you do not mention giving them any ground grains in the shape of either dry or wet mash. This is needed for best results with poultry, and I presume that you are feeding such a mash. It is true that hens will sometimes lay well on whole grains alone, but, as a rule, they will do far better with some of their food in the shape of more easily digested and assimilated ground grain. Hens and pullets sometimes refuse to lay well even though conditions seem ideal. The defect is sometimes in the strain, they are not "bred to lay," and sometimes it is impossible to make a good guess as to why they are derelict.

Sweet Potatoes and Hens

I noted an inquiry as to sweet potatoes drying up cows, and Mr. Massey's opinion to the contrary. There is a widespread and ancient belief throughout this section that sweet potatoes will stop hens from laying, and doubtless the belief as to drying cows is derived from this. Sweet potatoes are excellent hog feed, and are readily sought by swine, but Irish potatoes are not. A hog will root up an Irish potato patch and bite a small piece out of every potato and then drop it. Sweet potatoes are wholesome and fattening to both man and beast, and are practically the bread of many poor people throughout the country districts, during Fall and Winter. The idea undoubtedly originated in the observation of people that soon after chickens getting cooked potatoes they quit or fell off in laying, which, as potatoes come in in the Fall, they would have done anyway, it being simply a coincidence that potatoes mature about the time of fowls going into the molt, and has about the same amount of influence on them as the moon has on the growth of crops. You can easily learn of this superstition by making the inquiry, and doubtless you will get answers from all over the South saying sweet potatoes will make hens stop laying, though, so far as I know, it has never been tried to see anything about it, and there is no reason to feed them, as they pay better in hogs or cows. Pumpkins are not popular in the South except for stock feed, as they are about as good a substitute for yellow yam as a mixture of corn and wheat is for buckwheat. M. A. P.
Alabama.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.

The Lamp in the Center



Saves Big Money Let Me Prove It

The only incubator built on the right principle, with the lamp underneath—square in the center. This means an absolutely even, regular temperature. No more cold corners. Note the big oil tank! This only needs to be filled once for a hatching, and **1 gallon of oil makes the hatch**—a saving of 75c to $1.25 each hatch.

Get Our Factory-Direct Price Get the Big New X-Ray Book

More Money From Your Hens!

Do You Want to Learn How?

WE are in a position to help you with your poultry. The best poultry writers in the country are ready to answer your questions, and will direct you step by step in the development and care of your flock. Through their help you may become an expert yourself, if you will follow their suggestions and take up a line of reading in connection with your practical work in the henyard. This service is free to all subscribers and their families. Make frequent use of it, and begin at any time.

THE MATING OF POULTRY.

At this season of each year the poultryman is interested in selecting and mating up his breeding pens, for all improvement must come that way. The first thing to consider is the purpose, just what are the definite results you are after. The beginner usually has some idea in his mind, either feathers for the showroom, or eggs and broilers for market. Also, the breeder who has been working for a dozen or more years recognizes certain tendencies in his flock which he wishes to correct or change, and this must be accomplished by careful selection and mating. Whatever you do breed for, utility or fancy points, never under any stress of circumstances breed from a weak male or female bird, for without constitutional vigor you have nothing. The only hope for success lies in rearing vigorous stock. It is a tremendous drain on a hen's vitality to lay 200 eggs in a year, and that is what we ask of her. Only one who has followed the shows for a few years realizes the strain it is on the birds to be cooped in the show room. So it comes to this; that we must breed vigorous stock, whether we are after eggs for market, early broilers or fancy feathers for the show room.

Inbreeding and line-breeding should be left to the expert and fanciers, and the ordinary poultryman should never breed closer than two generations; that is, use the male birds hatched in 1913 on the females of 1911 and 1912. Select big strong hens, the late Fall layers if possible. Never breed from pullets, not because of immaturity, but because a good pullet that has been bred and fed right should begin laying in September and lay right through Fall and Winter, and has been under this severe strain for six months when you first think of saving her eggs for hatching. The consequence of this is, her vitality is at a low ebb; the eggs test weak, and the chicks that hatch have not the strength to live and produce healthy birds. I have often been asked whether if one had to breed from pullets, would it be better to use an old male bird, but how can the use of an old male bird bring back or restore the vitality the pullets have lost by six months' heavy egg production? If a pullet does not lay well during those six months, then she is not the type of bird I want to breed from. Only a couple of years ago a breeder of a few years' experience said he was going to sell off all of his hens, only keeping his pullets, as he had found he was keeping his old hens for several months at a loss. He realized his mistake in a single year from the trouble in rearing young stock. The greatest obstacle to success in the poultry business is in rearing chicks, getting enough young stock each year to keep the flock where it ought to be.

Other things being equal, I would use a cockerel to breed from every time, provided he is an early hatched mature bird. At one year old he is just in the height of vigor, and if kept far enough away from the hens they can be kept by themselves without fighting, or they can be mated as early as prepared. The only good argument against using a cockerel is that sometimes some defect shows after the first month, which could not be seen earlier, but they are so much more virile and active than older birds that we have 30 pens this year mated with April-hatched cockerels.

I know it is not "according to Hoyle" to discard the males after one year's use, yet my experience has been that they as a rule are sluggish, and when you find many infertile eggs in your testing, you should look for the trouble in the pens where you are using old male birds. The exception to this rule is where we have occasionally such a perfect bird that we can afford to mate him with a few hens; then I would select a few of the very best hens, and keep the chicks separate or mark them. There are many signs whereby you can recognize a vigorous bird. A strong male carries himself proudly; he is "monarch of all he surveys." Crowing is another sign of vigor; "scrappiness" is another sign of a desirable male bird. There are other signs, but if a bird is otherwise what is wanted and shows these characteristics he may safely be used to breed from. The hen's actions show her vitality; the vigorous hens are the most active, first off the roost and last to go back at night. Also a happy hen singing while at work is a good one to breed from. The early and persistent layers are always the ones with the vitality to use the feed and turn it into eggs. FLOYD Z. WHITE.

Partridge Wyandottes.

Is the Partridge Wyandotte as good an egg producer as the White or Silver Laced Wyandotte? G. F. K.
Wells River, Vt.

Partridge Wyandottes have not yet demonstrated, so far as I know, their ability to equal in egg production, either the White or the Silver Wyandottes. In the egg-laying contest at Mountain Grove, Missouri, the 30 Partridge Wyandottes averaged in 1912 only 99 eggs. In 1913 their average was 110 eggs. The Silver Wyandottes in the same years averaged 160 and 172 eggs; being exceeded in 1913 by the White Leghorns, with an average of 173 eggs. In the contest at Storrs, no Partridge Wyandottes were entered. The one pen of five Silver Wyandottes laid 783 eggs; an average of 156.6 per bird. Of course these figures do not absolutely prove that Partridge Wyandottes are always inferior to the other breeds named as egg producers, but they give us all that we have to judge by; and herein lies one of the values of egg-laying contests. GEO. A. COSGROVE.

PASSENGER: "Do I have to change cars in Chicago?" Excessively Polite Conductor: "Not necessarily so, madam. You can go back to New York, if you want to."—Life.

Ship Eggs in this Box by Parcel Post

The New Wright Egg Box is the strongest and lightest package for shipping hatching eggs or fresh table eggs. Easy to pack—each egg has absolute protection—cannot shake or jar. Wright boxes are shipped to you flat and are easily set up and packed for shipment to your customers. *Write today for Free Booklet* describing The Wright Boxes for shipping chicks and eggs.

PUBLISHER'S DESK

Since I received a notice of renewal for your farm paper, I take time to reply as follows:

If you are going to continue the policy of assailing, and attacking the business of other business concerns, I don't want the paper. I have been reared a farmer, now own and operate one farm, and I know at least 100 of the Strout agents are farmers, and all have suffered financial loss on account of the articles you published in your paper the past year. In my case I spent three years trying to build up an agency here, spending money I earned farming and carpentering, and when I got to a point where there was beginning to be some reimbursement and prospects of profit your articles set me back at least one year. Now I am not going to quit; no, no; my credit is good, and I will win, but the fact is I have been damaged, and I was brought up to abhor anything approaching the small business of trying to throw my brother traveler down in order to lift myself up.

We have courts for the trying and convicting of offenders, and all those offended have access to them. Therefore it is not the business of a farm paper to weigh other business concerns and decide if they are found wanting or not, and if you are going to continue this policy, discontinue the paper. If you are going to abandon it, me and my friends will take and boost the paper. H. W. M.
Hammonton, N. J.

We are sorry to differ from any man who thinks he qualifies to speak for farmers and the proper functions of farm papers. But, from our experience, the courts do not always afford protection or redress to the offended; nor do they always convict and punish offenders. Some of the worst swindles of which we have knowledge were perpetrated under perfectly legal forms.

We also differ from you on the functions of a farm paper. We do not contend that a paper should take testimony, weigh evidence, and mete out punishment to offenders; but we do hold it is the privilege and the duty of a farm paper to know when and where its subscribers are in danger of being imposed upon; and to make such facts known as will enable the subscribers and the public generally to protect themselves That is our idea of service. Any other policy, and especially the carrying of dishonest advertising, is nothing short of a conspiracy with the dishonest advertiser to exploit the subscriber. We would be glad of your help and the help of your friends in the line of this service; but we could not pay your price for the boost you could give the paper. Indeed there are situations in which friendship can be regarded only as a menace. You cannot serve two masters.

You say you have lost business because of what we have published. We would regret causing loss to any honest business, but as a farm-bred man you will hardly deny that farmers have a right to expect information imparted to them through their farm paper. In at least some instances your company has charged farm buyers from 50 to 70 per cent, of the selling price for their services. You know their schedule charges are now from 10 to 20 per cent. at least, and a recent complaint seems to indicate that farmers sometimes pay more. You must know and your employers know they cannot induce a buyer to pay 10 or 20 per cent., if he knows that he is paying it. Hence to make the deal they must keep him in the dark or deceive him. They do not let the buyer know all the conditions of the sale. They could not make sales yielding such profits if they did. We think it our duty to tell the buyer what they keep from him. If you cannot do business where such facts are known, it is your fault, not our fault.

If you have unwisely invested your earnings we are sorry. If you had come to us in time we would have been glad to advise you and serve you. When you ally yourself against the interest of those we are bound to protect, we can be of no further service to you. Your subscription is discontinued.

Mr. J. F. Freeman came to my place during the Fall of 1911, representing the Allen Nursery Co. of Rochester, N. Y., and sold my wife a bill of trees, and agreed to come and set them out and to keep them pruned for three years. Also added $5 worth of apple trees to the order that she never bought. C. F. T.
West Virginia.

The above corroborates previous complaints which have come to us about this agent Freeman, and in fact is typical of the methods of the agents. Farmers must not confuse this class of agents with the upright men selling trees in their own community year after year. Those selling "gnff" trees seldom visit a neighborhood the second time and don't ever deliver in person the trees they do sell. The court decision in the Batavia case upholds the advice we have often given tree agent victims, that they can not be compelled to pay for trees sold on the strength of false statements and should not be bluffed into doing so..

Some weeks back we referred to a scheme that was being worked by an agent of D. B. Cornell Co. of Great Barrington, Mass., in New York State. It was a scheme for selling farms or more properly a scheme to induce owners to pay for selling them whether the sale was effected or not. We have had slight modifications of the same scheme from other sources from Ostrander up and down. Now the New England papers are full of complaints arising out of the Cornell Company scheme and practice. There are many real estate agents willing to sell farms on a fair commission for their services. Why listen to specialized schemers? If you touch a red-hot iron, you are pretty sure to get burned.

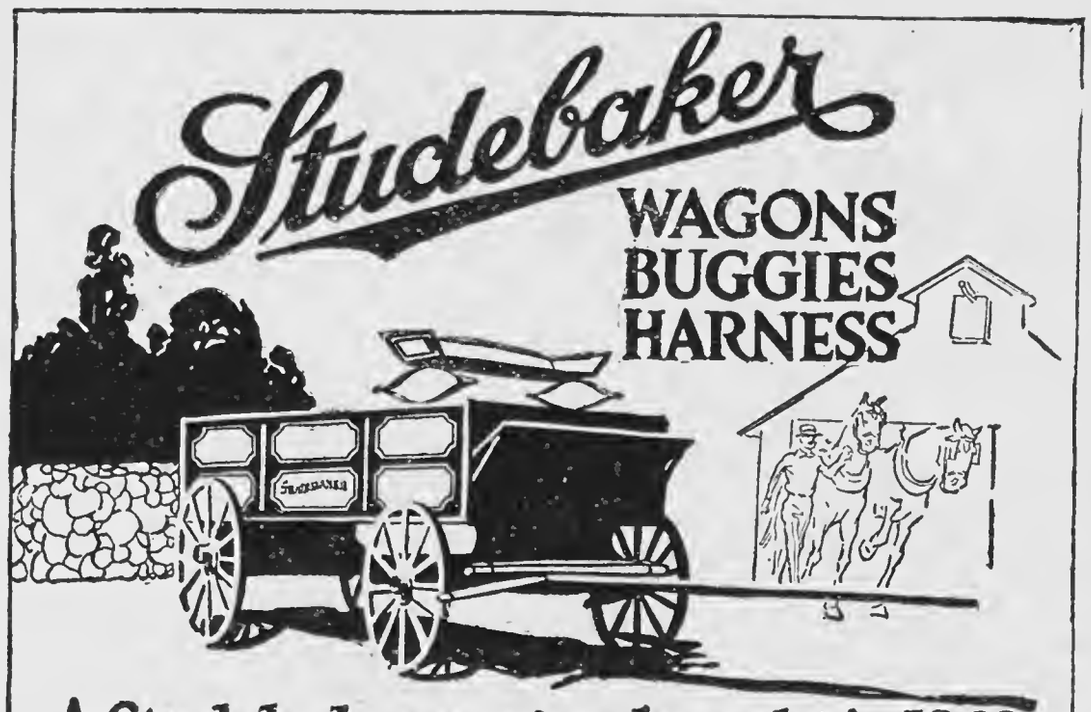
All over the country companies of capitalists and bankers are being formed with the alleged purpose of financing farm mortgages. In many instances they are called coöperative. Do not let any farmer be deceived by these representations. They are not coöperative. They are the direct opposite of coöperative principles. They are on the opposite side of the fence. In cooperative efforts the associations or companies are composed entirely of debtors. They sell their credit in land and get money to buy it or improve it. These companies are composed of and controlled by capitalists, large or small. It may be safe enough and well enough to negotiate with them for a mortgage, if the contract is definitely and carefully drawn to protect you by your own attorney, but such concerns have no right to masquerade under the pretense of coöperation.

Some time ago I received through the mail a package supposed to contain a razor from the Victor Razor Co., 412 Drexel Bldg., Chicago, Ill. There has been an epidemic of razors in our neighborhood. In the past two or three years I have received several such packages and returned them. I do not care to continue to open up such mail and take up my time re-addressing packages and returning them without pay and receive threatening letters from these people when they do not get the money promptly. Is there any way the practice can be stopped? I have not returned the last razor nor sent any money, as I do not intend to purchase the razor. Can the company compel payment or return of razor? J. R. V.
New Jersey.

We have numerous similar complaints. A surplus of this literature must be going out. A subscriber sent one of these razors to us some time ago, and we had it examined by an expert, who reported that it seemed about the quality which sold for 75 cents in retail stores. There doesn't seem to be any way to prevent them from sending out these razors and there is no obligation to return them. To do so may save some annoyance. Collection agencies will threaten to sue, but fake concerns of this sort never actually go into court. They only hope to bluff people into paying the money by threats. Our advice is to refuse to take the packages from the postoffice or complain to the Postoffice Department, Washington, D. C.

Is this a new scheme of the Thwing Co., or the Circle Magazine? Is it good or isn't it? H. D.
New York.

This inquiry is about lots at Demarest, New Jersey. It is away out in the country, where no trolleys run, and trains are not frequent. But Mr. Thwing says he has land there that he is to divide into lots. He attempts to tickle the vanity of his prospective dupes by distinguishing 100 of the first purchasers as founders; and promises them 100 per cent. profit. It is the old E. G. Lewis scheme, only Lewis promised 1,000 per cent. profit. In comparison Thwing is modest. A publisher should be tarred and feathered for exploiting the public in such a way through a paper and through the mails. J. J. D.



A Studebaker wagon bought in 1868 —and working today

AWAY back in 1868 Mitcheal Everman of Centerville, Ia. bought a Studebaker Farm Wagon for $110.00. The wagon has faithfully served *three generations* of farmers and C. H. Everman, grandson of the man who bought the wagon, writes "there is not a crack in the hubs." Perhaps you would like to read Mr. Everman's letter. It would be difficult to write a more convincing argument in favor of Studebaker Farm Wagons.

Here is the letter:

Studebaker, South Bend, Ind.—I have a Studebaker Regular Farm Wagon that was bought in Centerville, Ia. by my Grandfather, Mitcheal Everman, in the year 1868—and has been in constant use in the family ever since. The wagon cost my grandfather $110.00 and has the same wheels, axles, skeins and bolsters on it today as when it was bought and there is not a crack in the hubs. The wagon is in reasonably good repair and I have recently been hauling 1½-yard loads of sand in it.
C. H. EVERMAN, Mystic, Ia.

WHAT THIS PROVES

It proves that the wagon bought by Mr. Everman was made of the best material and workmanship—that's why it is still working—

It proves that it pays to buy the *best.*

Studebaker wagons are the best.

Even if a Studebaker wagon costs a little more at the time of your purchase—if it will last a lifetime, it is the best wagon to buy.

Studebaker Wagons today are built of the very best material and because of the improved method of manufacturing they are even better than they were in 1868—and the price is less.

Just remember that Studebaker has been building wagons for over sixty years and during all that time their one effort has been to build not the cheapest, but the best—that is the reason they are the largest wagon builders in the world.

Studebaker buggies are also built to last a lifetime and have no equal in style and finish.

PRODUCTS, PRICES AND TRADE.

Receipts of milk at New York continue unusually large for the season. Where possible the buyers are squeezing a 10-cent reduction from the producers, but there is still considerable business on the same basis as reported previously, $1.91 for B and $1.71 to $1.81 for C.

*

It is said that 40 cheese factories in Eastern Canada have gone out of business during the past few months. The raw milk and cream are shipped to the United States duty free, while butter and cheese from Canada are subject to a tax.

*

Another drop of four cents is noted in the butter market. This makes a total decline of 10 cents on top grades and six to eight on ordinary stock since the first of this year. A range of 25½ to 26½ covers most business in choice creamery. The best storage is held nearly as high, as speculators hope for a temporary advance. Some newspapers are printing ridiculous stories of the immense losses suffered by dealers because of this drop in prices. They figure that because butter is 10 cents lower, on the possible 5,000,000 pounds now held in New York, $500,000 has been lost. But this is one of the contingencies of trade for which provision is made. An occasional dealer may be hit harder than he can stand, but the rule is that the losses are distributed widely, and merely offset a portion of the profits. Another fallacy is that the retailers are charging as much as before the wholesale price fell. Exceptional cases of this sort may be found, but the majority of retailers dropped their price as soon as there was any warrant for it in the wholesale trade.

*

The egg market is weak and unsettled. Receipts are only moderate, but buyers are holding off, taking only enough for quick current needs, evidently expecting lower prices. The movement of storage eggs is a little more free, holders making good concessions to attract business. The white eggs from nearby are running too small to bring the top figures in current quotations, few going above 35 cents wholesale.

*

The apple market is in a healthy condition, demand being steady, taking up current arrivals quite readily. Barrel stock of standard varieties wholesales from $3.50 to $4.50; fancy Winesaps about $2 above this top figure, and Newtowns about the same. This includes the Albemarle, from Virginia. This is the season when York Imperial makes the best showing at New York, and some fine specimens are seen, both from the West and Old Dominion sections.

*

What is known as the "balance of trade" with foreign countries was $629,127,531 in our favor for 1913. Our exports were valued at $2,484,311,176, and imports, $1,792,183,645. We exported food stuffs, cotton and oil to the value of $120,716,004. By far the largest item of value was cotton, 636,088,718 pounds, worth $81,953,499. Breadstuffs amounted to $11,149,494; meats and dairy products, $12,003,536; cottonseed oil, $1,913,518, and mineral oil.

*

A shipment of 200 tons of dressed beef and 500 tons of butter from New Zealand is on the way to Vancouver, B. C. The distance is about 6,500 miles.

*

Here is an incident showing the jug-handled workings of some of our laws for the alleged safeguarding of health. A package of poultry arrived at a produce house, and before it was opened an inspector came in. He demanded to see the poultry, and sorted out and condemned a liberal quantity, sprinkling it with chloride of lime. As usual he gave the dealer a certificate showing the amount condemned and this was sent to the shipper with returns for the remainder which was sold. The shipper felt that it was an outrage and accused the commission man of making a plot with the inspector to swindle him. In two or three weeks the commission man was served with a court summons to answer the charge of having putrid meat in his possession. The case was adjourned, but there is strong probability that the dealer will be fined anywhere from $50 to $500, the latter not being an unusual sum for such violations, where no "mitigating circumstances" are visible to the powers that be. In some cases the man is convicted, but the violation termed a "technical offense" and fine suspended, though just what makes the difference is not visible to the layman. W. W. H.

CHAS. McNALL, Milton, Vt.

Sweet Peas

A Spray of Burpee's King Edward Spencer Sweet Pea

The Burpee Collections advertised below are the choicest yet offered. Such values would be impossible even with us, had we not increased our acreage in the Beautiful Lompoc ("Little Hills") Valley, California. Here, under the direct personal care of the Resident Manager at our FLORADALE FARM—"*The Home of Flowers*"—we had the past season *one hundred and eighty acres of* SWEET PEAS *alone!* We hold the largest stocks of SELECTED "SPENCERS" in the world.

Six "Superb Spencers"

For 25 Cts. we will mail one 15-cent packet of BURPEE'S ORCHID, the most beautiful helio-mauve, which alone sold last year at 12 seeds for 25c—one regular 10-cent packet (40 to 50 seeds) each of BEATRICE SPENCER, deep pink; GEORGE HERBERT, rosy carmine; MRS. C. W. BREADMORE, cream edged rose; STIRLING STENT, best glowing salmon-orange; also one large packet (90 to 100 seeds) of The New Burpee Blend of Surpassingly Superb Spencers for 1914, which is *absolutely unequaled*. With each collection we enclose our Leaflet on culture. Purchased separately, these 6 packets would cost 65 cents.

Six "Superfine Spencers"

For 25 Cts. we will mail one regular 10-cent packet (containing 40 to 50 seeds) each of APPLE BLOSSOM SPENCER, rosy-pink and white; DUPLEX SPENCER, cream-pink and apricot; ETHEL ROOSEVELT, primrose flaked rose; OTHELLO SPENCER, rich maroon; TENNANT SPENCER, beautiful mauve, and THOMAS STEVENSON, most glowing orange-scarlet.

For 50c we will mail both collections named above, and also a 15-cent packet of KING WHITE, our greatest novelty for 1914.

Eight "Elegant Spencers"

For 50 Cts. we will mail one regular packet (containing 40 to 50 seeds each and costing 10 and 15 cents per packet separately) of AURORA SPENCER, flaked orange-salmon on cream; DAINTY SPENCER, white edged rose-pink; FLORENCE NIGHTINGALE, clear soft lavender; IRISH BELLE, rich lilac flushed pink; KING EDWARD SPENCER (illustrated in this advertisement), magnificent crimson; MRS. ROUTZAHN, buff suffused light pink; QUEEN VICTORIA SPENCER, beautiful primrose, and VERMILION BRILLIANT, the best iridescent scarlet. These eight were all first named and introduced by us, and are shown painted from nature on the last cover page of Burpee's Annual for 1914.

For $1.00 we will mail all three collections as offered above, and also a 15-cent packet each of KING WHITE, our greatest novelty for 1914; and the new GIANT HERCULES, best of all warm pinks; TWENTY-TWO TESTED SPENCERS OF FINEST FLORADALE Stocks for a Dollar. This great offer could not be duplicated anywhere else in the world. When ordering it is sufficient to write for BURPEE'S SPECIAL DOLLAR BOX OF SPENCERS.

Burpee's "Seeds That Grow"

are supplied each season direct to many more planters than are the seeds of any other brand. BURPEE'S SEEDS are known the world over as the best it is possible to produce, and are acknowledged the American Standard of Excellence.

In thirty-seven years of successful seed selling we have introduced more Novelties that are now in general cultivation than have any three other firms. We produce Selected Stocks upon our own seed farms in Pennsylvania, New Jersey and California, while FORDHOOK FARMS are famous as the largest trial grounds in America. No Government Experimental Station attempts such complete trials each season, and the information here obtained is of incalculable benefit to planters everywhere. Simply send us your address plainly written and kindly name *Rural New-Yorker*. Then by first mail you will receive

The Burpee Annual for 1914

A BRIGHT NEW BOOK OF 182 PAGES—it is known as "THE SILENT SALESMAN" of the World's Largest Mail-Order Seed Trade. Bound with covers lithographed in nine colors, it shows Six Novelties and Specialties in unequaled Vegetables, and sixteen Beautiful New Flowers, including the most Superb "SPENCERS" as grown at BURPEE'S FLORADALE RANCH, the California "Home of Sweet Peas."

With hundreds of illustrations and carefully written descriptions it is a SAFE GUIDE to success in the garden, and should be consulted by every one who plants seeds, either for pleasure or profit. We are plased to mail it FREE to everyone who has a garden and asks for it. Shall we mail YOU a copy? If so, kindly mention *The Rural New-Yorker,* and write TO-DAY.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LXXIII., No. 4242. NEW YORK, FEBRUARY 14, 1914. WEEKLY $1.00 PER YEAR.

AN EXPERIENCE WITH A TRACTOR.

Good Where It Can Pull.

Here is something about my experience with a tractor engine, plow and harrow outfit. A slick salesman who promised everything sold to me on his claims for the rig two years ago last Fall. The 25-horse engine would not pull four plows in Alfalfa sod, set eight inches deep, and at seller's expense I sent it back, and was shipped a 45-horse double cylinder oil-burning engine. It will pull provided —and here is the kernel in the nut—it has a good solid, footing, as a sod, but if it is sandy land, or wet land, or if only a cover crop on soft soil, it will *not* pull—not even its own weight at times. It is a splendid machine, and we have had very little trouble with it as a piece of machinery. We cleaned up an old apple orchard in two days by hitching the tractor in the crotch of the trees; the largest trees were first given a light charge of dynamite to loosen up the ground around the big roots.

We hitched the tractor to a heavy road grader, and two rounds in March did several miles of gravel roads more good than you would believe, thus proving that every county ought to have such an outfit to keep the roads high in the center and the ditches open.

On my farm in Monmouth County, N. J., I have demonstrated that Alfalfa is a wonderful crop, making four crops a year if it gets fair rainfall and the first crop is taken off early. But plowing up the Alfalfa sod with us is like breaking new ground, the roots being so thick and heavy. Farmers near me refuse to grow Alfalfa because they cannot break it with horses, but with the tractor I walk through it. However, I have to lift two plows and use only four bottoms, for I want to plow deep. And here is another almost fatal weakness of the rig I got—the plows will not go deep, and there are no power gang-plows made which will go over eight inches and work well, whereas I want to plow 12 and 15 inches deep, and that takes power and lots of it.

The tractor outfit did fine work the first Fall on our old sod, except in depth. In the Spring we could not use it as early as we could horses, for where ground is rather soft the wheels of the giant machine dig a grave for itself. We succeeded, however, in doing one good job, which we had failed before to do with horses. As soon as the Timothy hay was off the tractor plow and harrow turned the sod over and made it ready for a cover crop of Crimson clover. At that time of the season we could not have spared the horses even if they could have plowed it, but it was too dry and hard for that. That plowing and the cover crop was certainly worth a coating of stable manure on the succeeding crop. But when we started to turn under a crop of cow peas on a field of sand, our tractor outfit failed us utterly—the wheels had no footing.

Where a farmer or an association of farmers has enough work to keep a tractor outfit busy 20 hours a day during the breaking seasons it will undoubtedly pay in this age of high prices for horses' feed and labor. But get a powerful machine and put headlights on it and run night and day. If I had it to do over I would get the new small-size caterpillar type of engine, for it will walk over sand, soft cover crops or mud, and pull its load. In oil and fuel they will in actual use consume about double what is held out to be sufficient by the slick salesmen. Though I feel stung, and have paid dear for my experience, yet I believe in the power plow, but I would want the caterpillar type, and I would want a small association of neighbors to share the cost, for it will plow 10 times more land than most eastern farmers have to break each year. For silage and wood sawing the tractor is great power. T. R. F.

R. N.-Y.—Here again is another side of the cooperation question. It is not only in buying supplies, but in buying power with which to utilize them, that the farmer will aid his economic conditions.

LOOK PLEASANT, BOSSY. FIG. 74.

ANGORA CATS AND RHEUMATISM.

A newspaper clipping received from a reader states that the German Minister to Haiti, recently arriving in this country, brought with him a large Angora cat which he permitted to sleep in his bed to relieve his rheumatism. It was said that the cat would gradually contract the disease, taking it from its master, and would eventually die of it. The reader wishes to know if there is "anything to this." I hope not, though I can sympathize with the German Minister, who is doubtless an estimable gentleman, and I am far from wishing our turbulent sister republic the infliction of a foreign diplomat with rheumatism. But I have possessed, or been possessed of, both rheumatism and Angora cats; together and separately, and I have never known one to react upon the other. Our finest Angora cat, a most beautiful "tortoiseshell" creature, died of old age at 13, though he lived in a family members of which have been almost helpless at times from rheumatism. It is an old belief that animals may "take" disease from their masters, and it is a well recognized fact that some diseases are transmitted to man only through the agency of lower animals. Unfortunately, however, the donor of disease does not rid himself of it; he only passes on a little of the seed, retaining the ripened fruit. Moreover, it is only the infectious diseases, or those that are transmitted through the agency of germs or parasites, that can be thus passed from one animal to another, and rheumatism probably does not belong in this class. No; this story is probably the offspring of a true American reporter's pen. The staid and scientific German mind never trifles with fact in this way, though the genial Dr. Friedmann almost convinced us at one time that some Yankee ways are catching. M. B. D.

MIXING LIME WITH MANURE.

Has Prof. Thorne, page 36, in his reply missed the point that R. J. L. will immediately spread the lime and manure after loading, and in such case would the lime be likely to act chemically upon the manure? We should like to know about this, for we are making a practice of spreading on top of the spreader load of manure a layer of cob ash—10 or 12% potash, 30% carbonate lime—before driving to the field. We have also planned to spread ground limestone in this manner, on land we eventually will seed to Alfalfa. W. A. W.

If manure and lime are mixed and at once plowed under the earth will probably arrest most of the ammonia that may be formed; but if the mixture of manure and lime is exposed to the air there will be considerable escape of ammonia into the atmosphere.

In the case of ashes, the lime is first in the form of oxide or quicklime, which reverts to the carbonate form on exposure to the atmosphere, so that fresh ashes would have the same effect as quicklime in liberating ammonia. Ground limestone would have less tendency in this direction, but we think the safest plan is to apply all kinds of lime or limestone separately from manure or fertilizers. In our experiments on the three-year rotation of corn, oats and clover, which has now been running nine years, when 1,000 pounds of quicklime has been applied to the surface, after plowing under manure, the yield is slightly smaller than when an equivalent amount of ground limestone has been applied in the same manner, although when the quicklime and ground limestone are used as direct applications to unmanured land, the quicklime is producing a greater increase than the ground stone. We suspect, however, that this larger increase is due to the liberation of nitrogen by the quicklime from the organic matter of the soil. If this is what is taking place the time will come when the soil nitrogen must be replaced.

Ohio Experiment Station. CHAS. E. THORNE,

WHAT SHALL THE LANDLORDS DO?

[We have had something of a discussion over the question of conservative father and progressive son, and also over the relations between landlord and tenant. Here is a new phase of it—presented in the following letter. What should be done with these boys?]

I have been a reader of your paper some few years, and as such, I would like to present to you a problem for solving. If you think it worth while present it to your readers for discussion. A few years ago a friend and myself purchased a 160-acre farm in one of the Central States, near a large and growing city. The farm had been under a cash rent for 15 years or more, hence much run down. We secured an excellent man (with a large family) to run the farm on shares, we furnishing the land as our half; he the work for his half. All stock and grains were to be held and paid for on this basis, and profits divided accordingly. We decided on dairying, bought a herd of cows, taking our farmer's note for his half of the cost of the cows. We were well satisfied; our man was very able and a hard worker. All money received as our share was put back into the place in shape of a new barn, imperishable silo, fences, and a new house with bathroom and furnace. But before the house was finished our man sickened and died, leaving a family, wife and 10 children. The three boys, oldest about 19 years, took up the work, but we soon noticed the difference; dirty stables, tools left out to rust, and a milk check about one-third of its usual size.

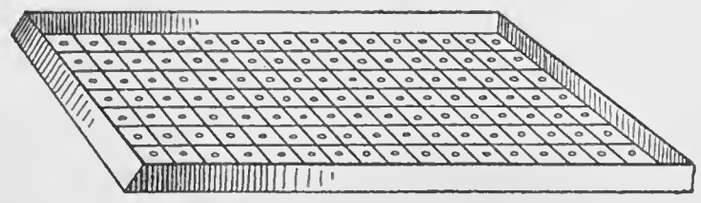
Now the question is what to do. A few more items may help in making up a decision. Neither my

Blocker—Hilling Hoe With Shank Straightened. Fig. 75.

partner nor myself need the income from the farm for our living. The farmers' note has been reduced by a few small payments (not by the boys, however). While the boys seem anxious to do the right thing, they do not seem to possess the right way. Our farm is rapidly being depleted, and the question is what to do. If you think this article with its question would interest your readers and cause some enlightenment I would be thankful to you for space in your paper. G. C. H.

CLOVER SEED IN 1913.

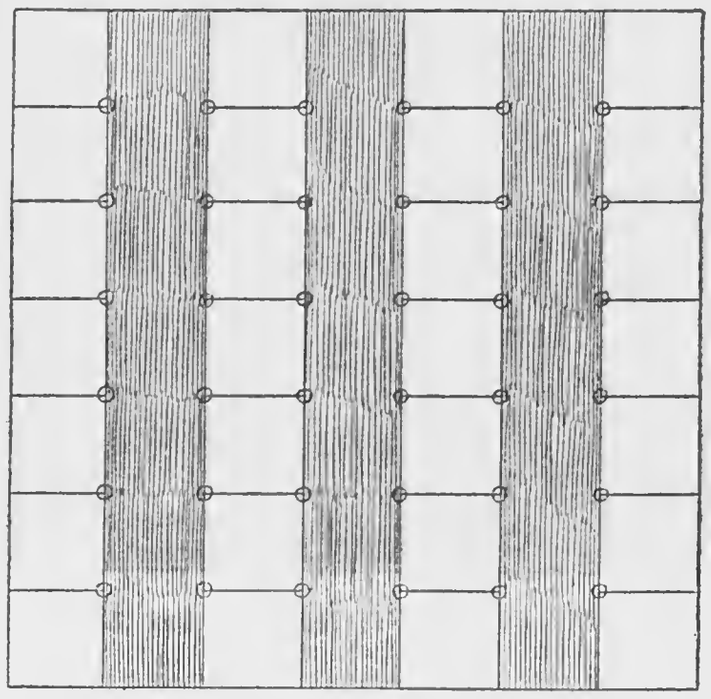
Mr. Edgerton, on page 35, wants to know "Why not tackle clover seed?" Why not, indeed? The writer, last season thrashed 25 acres of Medium clover, obtaining a fraction less than 45 bushels of prime seed. From a part of the field a crop of



How Soil and Manure Are Cut in Blocking. Fig. 76.

clover hay had been cut early, another portion had been cut 10 days later, while a third plot, owing to scarcity of labor was clipped, the hay being left as a mulch on the ground. The Summer being excessively dry and hot until a few days before seed cutting, the mulched part had far heavier bloom, and the seed was better filled than in either of the other sections. Several acres of thin land, top-dressed the Winter before with cattle manure, gave a better yield of both hay and seed than the lower fertile portions.

Before clipping we were told that the heavy top growth would certainly smother out the plants beneath, and in a wet season this might possibly occur, but we found only one or two little patches killed out. With clover selling at $3 to $4 an acre in the field, are we not better justified in clipping



Field With Plants Set at Circles. Fig. 77.

and returning to the soil rather than disposing of it and spending the Winter months in hauling manure a mile from town, and sometimes having to give straw in exchange for the manure? This clover would make two good loads per acre, and considering the humus added to the soil and the benefits to the following seed crop, we think we are justified in clipping.

Has anyone ever tried spring-toothing a light stand of Red clover to kill out weeds and grass—on the same plan as Alfalfa seedings? We had three or four acres that were partially killed out by a Winter overflow, and it grew up so thickly in grass we did not thrash it. Red clover, with a wider rooting system than Alfalfa, might not stand deep harrowing. We shall know about this before another year, as we have 10 acres of Mammoth clover that is about a two-thirds stand. The ground is thin on which it is growing, and we have planned to leave it for seed, using the light draft harrow with Alfalfa teeth to dig up the top two inches, after the clover plants start growing. If less than a two-thirds stand comes through the Winter we shall drill in a light seeding of oats early in Spring.

Montgomery Co., Ind. W. A. WITHROW.

FARMING IN NEW ENGLAND.

The case of "A. S. A.," as narrated on page 80, telling of a man of middle age, with an aged father, and no woman's counsel or help, seems to me to call first for a woman, either in the capacity of housekeeper or wife; and next, a modification of present management of the farm to meet existing conditions as to climate and markets. With a population for this New Hampshire town of 6,000 within seven miles distance, it is a fair presumption that the entire product of 10 acres of tillage land could find a ready home retail market if put into such crops as will withstand the conditions as to frost. If beans, cucumbers and tomatoes are too risky, these might still be hazarded as a catch-crop for favorable seasons, and other crops less susceptible to frost substituted for a dependence.

I believe that any New England town of 7,000 inhabitants would take care of a half acre of strawberries and a like area of asparagus, and these two crops are immune to destruction from frosts, although somewhat retarded to be sure; however, they are capable of producing large values on small areas. An acre in these two crops skilfully handled should be worth several times the area in such staples as corn and potatoes. When in Florida a few Winters ago, a freeze which destroyed the orange crop seemed to have merely a retarding effect upon the strawberry crop. This was on the last night of the year 1910, and strawberries were in full bloom, but much to my surprise, they were harvesting a good crop a few weeks later. This was the frost-proof Klondike variety, which is specially adapted to the far North as well as far South conditions.

As to asparagus, which requires one more year of waiting than strawberries for its first crop, the tender shoots are spoiled by freezing; but as the life of the plant is in the crowns, several inches below the surface, a few warm days suffice to bring on another lot of shoots.

Among annuals, lettuce, peas, beets and onions are semi-hardy and will go through cold weather which would utterly destroy the crops which "A. S. A." mentions. No mention was made of fruits. With 10 acres of tillable land, I should plant at least two acres to apple and plum trees, either using the plums as fillers between apple, or putting a solid block of plum and locating the poultry yards among them. Japan plums and their hybrids are adapted to our Eastern conditions. Immense crops of these are grown as far away as the Pacific States and sold in our New England towns. I believe that everything considered the plum is our most promising fruit for immediate consumption and canning. And as to apples, while planting our staple Baldwins, that call for a 10-year wait for cropping, we have plenty of early-bearing sorts for fillers, which begin to produce crops in one-half that time or less.

We have in populous New England one advantage which goes a long way to offset any defect of soil or climate, and that is the market that clamors at our doors. A location near a thriving village gives the producer a chance at the whole of the consumer's dollar, which no city market can rival. Our opportunities here are not yet half worked, although the fact that farm values here in the East have in many localities trebled within 15 years is significant. Probably the greatest of our lacks is the lack of farming capacity to grow and market crops to the limit of their possibilities. It is true of the town in which I live as well as of any locality with which I am acquainted, that the home market for fruits and vegetables is inadequately supplied, especially with that of the choicest quality. Such papers as THE R. N.-Y. are accomplishing more than any other agency to awaken among farmers a sense that only more skill is wanted to change many a comparative failure into a pronounced success.

Massachusetts. FRED W. PROCTOR.

"CO-OPERATIVE" silos are popular in Wisconsin. The name does not mean that several farmers feed out of one silo, but that several farmers combine and use the concrete forms furnished by the College of Agriculture. Such forms cost about $40 each, but through coöperative work farmers can obtain them for $10.

DETAILS OF EARLY TOMATO GROWING.

PART II.

BLOCKING.—About two weeks before plants are transferred to the field or after growth has well started they are "blocked." That is, the soil and manure in which the plants are set is cut clear through so as to have each plant in an individual cube of soil and manure 4½ inches square and five inches deep. The blocking or cutting is all done from above with a "blocker." The blocker (see illustration) is nothing more nor less than a large hilling hoe having a blade 10 inches wide, and straightened at the shank so the cutting edge is in a direct line with the handle. A nib is put on the handle about 18 inches from the top and when using is grasped by the right hand. When blocking, sashes are slipped off and the man doing the work stands on the rafters which usually support the sash, or if desired on a board placed across the frame. He cuts between the rows of plants, running crosswise of the bed first; then cuts as far as he can reach in the opposite direction (see diagram). He has the blocker sharp, and is careful that it cuts clear through the manure, thus leaving each individual plant in a square block of soil and manure all to itself. Two men working together do the blocking to best advantage, each taking one side of the bed. With experience this work is done rapidly; 15 to 20 thousand plants being considered a fair day's work for two men, although much more than that is often done by expert hands. Blocking is our substitute for paper pots or berry boxes. It eliminates that extra expense, and subsequent handling of plants is much easier than if pots are used.

SETTING OUT.—If growth in the cold frame has been regulated by judicious watering and careful attention by the fifth of May the plants will have a thick stout stem with little side branches starting at leaf joints, and the buds forming what is described as the crown setting will be partly opened. The night before plants are set in the field, the bed is given a good soaking. This permits the soil and manure to become settled over night. The next morning the plants are loaded in ordinary two-wheeled Jersey dump carts, or low wagons, and taken to the field. These carts hold from 80 to 100 plants. Some growers have extra large cart bodies that they put on for this purpose, holding 135 to 175 plants. Plants are lifted from the frame to the cart by forks or shovels. The whole block is taken with the plant standing upright and undisturbed in the middle of it. With a six-tined fork six to nine plants can be lifted at one time without crushing the blocks. After the cart is loaded it is driven to the field, plants taken out one at a time and placed where they are to stand. If everything has gone right there will be scarcely a crushed block in the cartload. All the plants will be standing up fresh and green, with their rootlets undisturbed, and ready to reach out for the abundance of plant food that has been supplied to stimulate the early growth which means so much in producing early tomatoes in quantity.

LATE PICKINGS OF EARLIANA TOMATOES FOR CAN HOUSE. WAGON HOLDS 180 BASKETS. FIG. 78.

PREPARING SOIL.—As earliness is the prime factor in determining profits, growers select the soil and location for their tomatoes with that in view. A rich, well-drained, sandy or gravelly loam with southern exposure and sheltered from heavy winds, makes an ideal location. However, such conditions are not always found, in which case growers select the best they have and make up in attention what they lack in location. That tomatoes can be made to succeed and produce early fruits on soil and under conditions not ideal has been fully demonstrated, but it requires more judgment on the part of the grower in the attention he bestows upon his plants. Tomatoes are grown in various truck-crop rotations, but the most popular is one covering four years, including first year clover, second year corn, melons or cantaloupes, third year sweet potatoes, fourth year tomatoes. Rye is sown as a cover crop after the potatoes. The rye has about 10 tons of manure to the acre spread on it in the Fall; the whole being turned under in the Spring before much growth is made. After plowing the ground is harrowed with an Acme to level the surface and conserve the moisture. This is repeated at intervals until the first of May, when the ground is marked.

MARKING.—When marking it is first decided which way the field is to be furrowed out for the plants. This determined, the marker, with hoes set 4½ feet apart, is run in that direction. Then it is run at right angles set at the same distance; leaving the field in checks 4½ feet each way, with the cross marks quite distinct. Plants are seldom given less than 4½ feet each way in the field, and recently there has been a tendency by some to increase this distance to five feet. Just before plants are set a two-horse plow set as deep as two horses can pull it, is run down the row just marked. This covers up the marks on one side of the row, but leaves the other side plain enough for setting plants, so they will be in line both ways of the field (see diagram). I will say in passing, however, that on some soils deep furrowing would be a disadvantage but on sandy soils that dry out quickly it is a distinct advantage; especially in a season of drought such as we have just been through. It is also advantageous to have rows furrowed out only a short while before setting plants, so that the soil will not become too dry. After furrowing a large handful of a quick-acting high grade fertilizer is thrown with a scattering motion "in" and "on" the side of the furrow opposite each cross or check where the plant is to stand, and all is ready for the plants. It will be seen from the above that extra heavy fertilization is not practiced. No plant food is used except that from the manure turned under with the rye and the fertilizer put in the hill. That placed in the hill gives the plant a quick start, and the manure maintains a steady healthy growth. Subsequent applications of fertilizer are seldom made, as a heavy vine growth would be stimulated, and tend to retard ripening and setting of early fruits. If the question of earliness were eliminated and a large crop the end in view, then heavier fertilization would pay.

SETTING.—Plants are set in the field with the first nice days after May 1. There is some danger from frost, but growers are willing to take chances with at least a portion of their crop, for a two day's start at time of setting often means a difference of as many weeks when picking time arrives. As stated in the previous article plants are brought from the cold frame to the field in carts. One man does the setting; he uses a small narrow spade to remove the plants from the cart and puts one in each cross, (point where the furrow and cross marks intersect) being careful to place them exact, so that they will be in line across the field. A second man follows the first, and covers the "block" with enough soil to make a good hill. Where several thousand plants are set, three carts are used to best advantage. One man loads at the bed, two men drive carts and set plants, and two men hill up.

INSECTS AND DISEASES.—Cutworms are often troublesome; if their presence is suspected growers use poisoned bran, placed about *four inches from the base of the plants* after each day's setting. If placed against the stem of the plant the poison will be as harmful, in effect, as the worms. Few growers spray thoroughly for blight, but from start to finish a continual fight must be put up against the potato beetle. Formerly Paris green was the poison used, but because of frequent damage by burning, growers are substituting arsenate of lead with better results. The first dose is given in the cold frame just before plants are taken to the field.

CULTIVATION begins as soon as plants are set, and a rapid thrifty growth depends upon it. It is practically all done with the ordinary five-tooth horse-drawn hoe-harrow. This harrow keeps the surface soil well stirred close to the plants and levels off the ridges. As harrowing is done both ways there is need of little work with the hand hoes, but in order to conserve moisture and have the tomato plants free from grass at picking time, harrowing is done regularly and often. As vines grow the harrow is not run so close to the plant and the teeth are set more shallow so that the small feeding roots will not be cut off.

PICKING.—This commences near the middle of June, and continues until August 10 or 15. Italians are employed for this work, and receive 2½ cents for a 20-quart basket. All early tomatoes are sent in baskets to Philadelphia and nearby markets, or packed in crates and sold to dealers who ship to New York, Boston and even to Canada. Last year thousands of crates of tomatoes were picked green and shipped to Canada. Two grades are made—primes and culls. Grading and packing is, in most cases, carefully done; but perfection along this line has not yet been reached. Each year's experience demonstrates anew the value and demand for better packing; and past experience of growers shows that it pays to put up tomatoes as the market demands. Last year many growers commenced picking before June 20, at which time they netted $3 and above a 26-quart crate. As tomatoes become more plentiful the price falls gradually, but usually remains above $1 a crate until after the middle of July. Canners usually commence buying the last of July and pay from 10 to 30 cents a basket. By August 15 the crop is practically all gathered, and in good time for plowing the fields and getting a good catch of clover. The picture shows a big load of tomatoes. These tomatoes were loaded on boats and shipped to Baltimore canners. The great and increasing demand for tomatoes in cans has created an outlet for even the last pickings of our early tomatoes. The Earliana makes an excellent canning tomato, and late in the season thousands of baskets are sold daily to agents buying for can factories. While they cannot pay the high prices received earlier in the season, still it all helps in making the crop a profitable one.

PROFITS from the system of tomato growing as outlined above are no more uniform from year to year than profits from other truck crops. But that they average high is clearly shown in the increasing interest taken in the crop by those who grow them each year: and in the care and attention they bestow upon the plants in their various stages of growth; and in the steadily increasing acreage. The past year witnessed some failures because of the exceptionally dry weather and the Southern wilt which struck this section for the first time. But those who had a crop did exceedingly well, with receipts in many instances above $200 an acre. In other years some have reported receipts as high as $400 an acre. The crop generally is both profitable and popular, and growers are continually putting forth their best efforts preparing for the next year's crop. It has been hinted that tomato growing may be overdone, but the many styles of serving and the wide distribution made possible by canning favors an enormous consumption. While the crop may not always be highly profitable, still present indications seem to justify growers in maintaining that the future production of first-class early tomatoes promises more in the way of possibilities and profits than ever before. TRUCKER, JR.

Refrigeration by Electricity.

I would like some practical information as regards refrigeration by electricity. I am a fruit grower and understand that there is a system of automatic refrigeration by using the electric current and ammonia. If you could give me any light on building such a plant—say 600 pound capacity—I would be pleased. I want only practical plans as regards construction, installation, cost of maintenance, etc. A. E.

So far as I know there is no system of refrigeration where the electric current plays any important part. Of course, the machinery is often driven by means of electric motors, in place of a steam or gas engine. The Automatic Refrigerating Company of Hartford, Conn., advertise that they are manufacturers of the only automatic refrigerating plants and the they are the only manufacturers who use electric power solely. They refer, however, to the use of electric power for operating the machinery in place of using steam power and the automatic feature refers only to the fact that the refrigerating plants are automatically shut down when the demand for electricity for the use of other customers is all that can be taken care of by the power house. This automatic feature is only of interest to central power stations making ice as a by-product. Their catalogues and booklets and those of Carbondale Machine Co., Carbondale, Pa., and United Ice Improvement Co., Marbridge Bldg., New York, may be of interest to you. R. P. C.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Pruning Plum and Cherry Trees.

We planted a few cherry and plum trees, last Fall. They were about six feet in height, each having between four and five branches. I would like to know how and when to prune them; would like to have them medium height. G. G.
Warren, R. I.

These trees should have been cut back severely when planted to prevent too much evaporation of the sap during the Winter. They may have been injured already from this cause, but it is not too late to help them by pruning. The new growth should be cut back half way or a little more if the trees are two years old and the branches are very long. If the trees are one year old they should be cut back to about 2½ feet from the ground. This will be the place to start the head, and care should be given when the new growth is starting to allow only such new branches to form as are needed.
H. E. VAN DEMAN.

More About the Apple Maggot.

I would like more information about several varieties of apples as to their susceptibility to the inroads of the maggot, the so-called "railroad worm." In a recent issue of THE R. N.-Y. we were told that, owing to being within the fruit from the time of the hatching of the eggs, spraying fails to reach them. The only available remedy for this pest in infected localities lies in the selection of varieties which are resistant to their ravages. Such fine old varieties as Porter, Sops of Wine, Garden Royal, in short the tender-fleshed, thin-skinned sorts are now a thing of the past because of this pest. Winter apples, generally speaking, are immune, their hardness up to the advent of cold weather protecting them from puncture by the egg-laying fly. Who can tell us the complete life history of this fly? Upon what form of vegetation does it feed as a mature insect, and is it a determined fact that spraying is positively without advantage in keeping it in check? In setting an acre to apples this coming Spring, I wish to plant a certain number of early varieties as fillers. I have in mind to try some comparatively new sorts for this purpose, as the Liveland Raspberry, Melon, Wilson, Red June, etc. Am I to know, short of expensive experimenting, whether these will eventually prove resistant to the maggot, or as complete a failure as the old varieties I mentioned? It would seem to me a very proper thing for nurserymen to do would be to publish such facts for the guidance of the buying public. Who can make us wise in this matter? I have found the Red Astrachan comparatively immune to the maggot. Is the Yellow Transparent as much so? The prevalence of this pest has well nigh destroyed the market for all early apples in this section. There are claims that spraying has proved beneficial in spite of our positive knowledge that the maggot does its work out of the reach of poisons sprayed.
Massachusetts. F. W. P.

There are few, if any, varieties of apples that are not infested by the apple maggot or railroad worm. Prof. Harvey compiled a list of apples in 1889 showing the relative infestation of varieties in Maine. Mr. Illingworth in his bulletin on the apple maggot has made some additions to this, either from his own observations or from the observations of Prof. Fletcher of Ottawa. The following varieties are sparingly infested: Alexander, Bailey's Sweet, Baldwin, Bullock, Calvert, Canada Baldwin, Catshead, Chenango, Danvers, Dayton, Derby, Detroit Red, Diana, Dyer, Golden Ball, Golden Sweet, Grimes, Haley, Irish Peach, Lady Sweet, Maiden Blush, Mexico, Munson, Ramsdell, Rhode Island, Ribston, Rolfe, Somerset, Swaar, Sweet Russel, Westfield, Williams. The following varieties are badly infested: Benoni, Bough, Early Harvest, Esopus, Fall Jenneting, Fall Pippin, Famense, Franklin Sweet, Garden Royal, Golden Russel, Gravenstein, Henderson, Hightop Sweet, Hurlburt, Jersey Sweet, Jewett Red, King Pippin, Mother, New York Sweet, Northern Spy, Oldenburg, Paradise Sweet, Porter, Pound Sweet, Primate, Pumpkin Sweet, Red Astrachan, Russel, Shiawassee, Sops of Wine, Tetofski, Tolman, Tompkins King, Twenty Ounce, Wagner, Wealthy, Winesap, Winthrop Greening, Yellow Bellflower. It would be an excellent idea for the readers of THE R. N.-Y. to make additions to this list of such varieties as have come under their observation. B.

Big Western Fruit Stories.

There are not quite so many fairy tales about fruit growing floating about this season, but there are still a few big ones from the Northwest. It is well enough to give the other side from our readers in Oregon:

In one of the leading fruit-growing sections of the West a man sold a small orchard. He said he sold so much fruit the year before (of course he raised it on his orchard) that the farm sold on the strength of the large yield. The next year the new owner had a larger crop and better apples, so the neighbors said, but he did not have near as many as the former owner said he sold. He went to the former owner and said: "How is this? I have a larger crop than you had last year, and yet I have not near as many as you said you sold." The other man said: "I sold the apples, and showed the books." He also said: "You buy your neighbor's crop and sell your farm." He sold two crops and it was supposed to be one crop only, and hence he received an extra price for the orchard.

A man bought a small tract. After the transfer he asked: "What can I raise on that land to pay interest on the investment?" The other man said: "I do not know, unless it is to raise the price." There is a man reported to have received $1,000 an acre for his pear crop. He is digging up his pear orchard and planting Alfalfa on the same land. Why would a man dig up an orchard that would bring in $1,000 an acre and sow Alfalfa on the same land, that will not bring $100 an acre?

Hedges and Windbreaks.

I wish to set out a hedgerow or something for a border between my garden and yard. I am thinking of Japanese barberry, or Althæa. Which do you think would be the better, and how far apart should they be set? I wish to set out a wind-break of evergreens west of the house. Which would be the better, Norway spruce or arbor vitæ (White cedar)? How far apart should they be set and how tall should they be for best results? Can you tell me where I can get them and about what they will cost?
Wurtsboro, N. Y. E. E. S.

Either Japanese barberry or Althæa would make an excellent hedge; choice must depend entirely on personal preference. The barberry is neat and compact at all times, needs very little trimming, and is beautiful when the foliage turns in Autumn, followed by cheerful red fruits on bare branches in Winter. It remains low, reaching with full growth a height of about four feet. It endures partial shade, and prefers a dry situation. The Althæa gives a blooming hedge at a time when other shrubs are not flowering, and is very handsome; it will grow taller and may be kept narrower than the barberry. You will find directions for setting a hedge in article on how to plant a place, page 70. You may set the Althæa 15 inches apart, the barberry 18 inches. Hedge plants are often set closer, but we must remember that we are planting a permanency. Cut the Althæa back as described on page 70.

We prefer hemlock spruce to all other trees for a wind-break. It is very hardy, beautiful in growth, and retains its rich green throughout the Winter. If desired it may be set in a hedge and clipped, or it may be grouped without hindering natural growth. The arbor-vitæ is handsome, but loses freshness of color during cold weather. The Norway spruce is good, but unless carefully pruned it becomes unsightly in a hedge. If this windbreak is to take the form of a hedge, avoid too close planting; Prof. Maynard advises setting a hemlock hedge five feet apart, and though such hedges are often set closer, there is no doubt that this gives good results. Any nurseryman will supply such shrubs; prices run about as follows: Althæa and Thunberg's barberry, 25 to 50 cents each (this does not include extra fine or new varieties of Althæa); hemlock spruce, 50 cents to $1. Let the wind-break grow as tall as it will, unless you fear shade damage to other plants.

Yellow Newtowns $1.25 to $1.40 per box; Spitzenburgs $1 to $1.25; Jonathans 75 to $1; Ben Davis 60 to 90; Comice pears $1.75 to $2; Bosc $1.40 to $1.75; Anjou $1.75 to $2; Winter Nelis $1.75 to $1.90. Strawberries in season brought $1.25 to $1.50 per crate 15 boxes (short); blackcaps $1.25 to $1.50; Phenomenal and Mammoth blackberries $1 to $1.25. Red raspberries $1 to $1.25. Loganberries 75 to $1. Dairy cows $60 to $90; butterfat at present time 30 cents. Alfalfa $10 to $12 per ton; grain hay $14; corn $20 per ton in the ear; wheat 90; barley $30 per ton; potatoes $1 per sack (about 100 pounds); tomatoes one cent to three per pound. F. E. U.
Central Point, Ore.

FRUIT TREES

SELL THEM as our representative in your territory. You are sure to be unusually successful because the quality and reliability of our trees bring repeat orders and make satisfied customers. We have been in business 81 years and stand back of you in a practical, helpful way. Write today for Local Representative Plan—part time or whole time. Ask for Plan A.

BUY THEM direct from us if you prefer. Prices are right; we protect you against nursery carelessness and subsequent loss. Scores of the largest, most successful growers buy our trees year after year. Write for valuable Catalog.

THE BARNES BROS. NURSERY CO.
BOX 8, :: :: YALESVILLE, CONN.

FRUIT TREES
AT
HALF AGENTS' PRICES.

We have no agents—we sell direct to you. Our prices one-half agents' prices. Why? Because we save you the agents' profits. That's dollars in *your* pocket, Mr. Fruit Grower.
All our trees are absolutely the finest stock. If any tree is not true to name and healthy, we replace it. Apple, Peach, Pear, Plum, Cherry, Quince, Shade and Ornamental Trees; shrubs, berry bushes and plants—all at money saving prices.
We pay freight on all orders of $7.50 or over.
Our catalogue is brimful of practical, valuable information—how to plant and care for all kinds of fruit trees. It will pay you to get it—absolutely free. Write today.

The Home Acre.

BEHAVIOR OF JAPAN PLUMS.

On page 45 I notice answer from W. S., Beaver Falls, about Japanese plums. As this is only a short distance from the district in which I have spent the last two years, I venture to criticise the answer. In Allegheny county the Japanese plum is a failure. They bloom too early. About one-half of the time they will bloom the last week in March or the first week in April, being put out of business by the frosts, so that I would not advise planting them. Most growers about here use the German and Italian prunes, Lombard, Green or Blue Magnum and the Damson. P. T. B.

Pittsburgh, Pa.

R. N.-Y.—We want such suggestions. The behavior of varieties is often so peculiar that only personal experience can decide.

BROOM CORN FOR GARDEN BORDER.

Various suggestions are made from time to time relative to what I term commuters' gardens; small plots ranging from one-quarter to an acre of ground, on which after the labors of the day, the rural commuter can find profit, pleasure and relaxation from the care and turmoil of "trade," and enjoy healthful relaxation with a hoe. With the one exception of horseback riding, there is nothing which is equal to that same homely utensil, the hoe, as a health preserver, and physical recreator. The man who knows how to use it as it should be used, exercises every muscle of his body and, if corpulent, will find his waist measure reduced without the aid of patent nostrums or deleterious drugs. The real hoe man is an artist, he can shave the surface, digging deeper, loosen the soil, and deeper still, turn up three inches from darkness to sunlight. He can clip a weed within a quarter of an inch of a plant, or thin out a row with equal dexterity. I did not start out, however, to expatiate on the merits of the hoe, but rather to tell of a beautiful border for any garden, which I have never seen used by any other commuter than myself. Each year across the rear of my garden or along the footpaths I plant a row of broom corn, planting the seeds in drill, and thinning out (with the hoe) to four inches. In the Fall the stalk has reached the height of eight or 10 feet (last year some of my stalks were 12 feet) and its seeded tassel has a very picturesque effect. When fully ripened the top should be bent over about three feet, and allowed to hang down, so that the weight of the seed will straighten the splints. When fully ripened and hardened, cut off the seeded stalk, thrash out the seed, and make the splints into hearth brooms. For this purpose take eight stalks, fasten with small copper wire, cut off the stalk to within two inches of the broom and the thing is done. Last year I made 40 hearth brooms from my row 100 feet long, and gave one of the brooms to each of my neighbors. I found hearth brooms not so good as mine selling in the city for 25 cents apiece. Let some of your subscribers try this broom corn border and I think they will repeat the experiment.

Garden City, N. Y. W. J. Y.

Fertilizer for Garden Crop.

I have a small garden plot which has a clay soil. The top soil had been graded off several years ago when the house was built. I have manured it well, and it produced a splendid crop of vegetables the first year, but last year it was a little off, particularly the corn, which leads me to believe that it is deficient in either potash or phosphorus, or probably both. We had a good many beans, which did well, and these vines will be plowed along with the other remains of last year's crop. Half of the plot was spaded and sown in turnips last Fall. A good many are still there to be plowed under, along with a good layer of rotted horse manure. Beets have grown on the ground last year,

Memphis, Tenn. H. B.

If this soil is to have manure each year, and still fails to grow suitable vegetables the indications are that potash and phosphoric acid are lacking. The usual suggestion is to mix three parts of acid phosphate with one part muriate of potash, and apply 400 pounds or a little more per acre. In some places it is difficult to obtain these chemicals. In such cases a mixed fertilizer high in potash and phosphoric acid will answer.

Ashes and Strawberries.

I have a fertile acre that four years ago got four or five tons of hard wood ashes, and has grown Alfalfa and been heavily manured every year since. Is it safe to plant it with strawberries this Spring, because of the ashes? A. P.

Crosby, Pa.

There will be little trouble from the effect of the ashes on the strawberries after four years. The advice against using lime or ashes means that they should not be applied at the time of planting, or within a year before. After four years, however, there would be practically no danger.

Hen Manure for Fruit Trees.

As I clean my chicken house every week, I take the manure and spread about a bushel of it to the tree, around peach trees set out a year last Fall. If I use wood ashes with this when is the best time to use the ashes, now or early Spring, before plowing under? How much ashes per tree? Would you advise using anything else and what? Trees made just a fair growth, 18 inches to 2½ feet; soil sandy loam. It is out of the question to keep this chicken manure in a dry place till Spring, as I have no place to store it, so spread it on ground as hauled out. H. S. T.

Vineland, N. J.

Under the circumstances this practice will answer. Leave the manure around the trees until Spring and then plow it under. After plowing scatter five or six pounds of wood ashes and rake or harrow in. This ought to give them a good start on that kind of soil.

Bark Bursting.

Last November we set out about 20 two-year-old apple and pear trees. Many of these trees seem to have small slits in the bark, though none seem to be dead. We have scraped these slits and applied white lead. Can you tell us if this is a serious condition and if we have treated it correctly? W. F.

Valley Stream, N. Y.

The trouble with these trees is what is called "bark-bursting" and is caused by their being in a flush condition and not well ripened when there came one or more cold spells. The contraction and expansion of the bark caused it to crack open. The painting with white lead is all right, but a coating of wax, put on with a brush while hot, would be better. This is easily and quickly done. Melt together five pounds of rosin, one of beeswax and one of tallow or linseed oil, and apply while warm. This is good for wounds made in pruning or as grafting wax. M. E. VAN DEMAN.

Hen Manure on Sandy Land.

What would you advise to use on land that has a good deal of hen manure? I have about one acre and keep 600 hens. Is there any danger of using too much? The land is sandy. H. H. R.

Merchantville, N. J.

Hen manure is rich in nitrogen. This is the element which induces a quick, strong growth of leaf and stem. The best crops to grow where there is an abundance of nitrogen are those which make most of their growth above ground—like grass, corn, cabbage, etc. Too much nitrogen will drive the crops into such a quick growth that they will "lodge" or fall down through weakness of the stems. One way to overcome this is to use chemicals with the hen manure. Three parts by weight of acid phosphate to one part of muriate of potash is a good mixture to use with the hen manure.

Destroying Poison Sumach.

Will you advise me how I can dispose of a poison sumach tree, which I have growing on my place? A. B.

Mountainside, N. J.

The bad reputation of the poison sumach, (Rhus venenata) make it an object that is carefully avoided by everyone who is familiar with it. It is commonly supposed or believed that it contains so virulent a sap, that it will cause fever and severe inflamation in any one who cuts it down, or for any other purpose comes in close contact with it. It is probable its inoculating power is considerably over-estimated, for it is no common thing to hear of anyone being severely poisoned by it. All the sumach family have a habit of sending up sprouts from creeping roots, and to get effectually rid of them, they must be pretty thoroughly uprooted by the use of grub-hoe or plow. When there are only a few to be exterminated, it can be accomplished by heavy applications of salt to the roots.

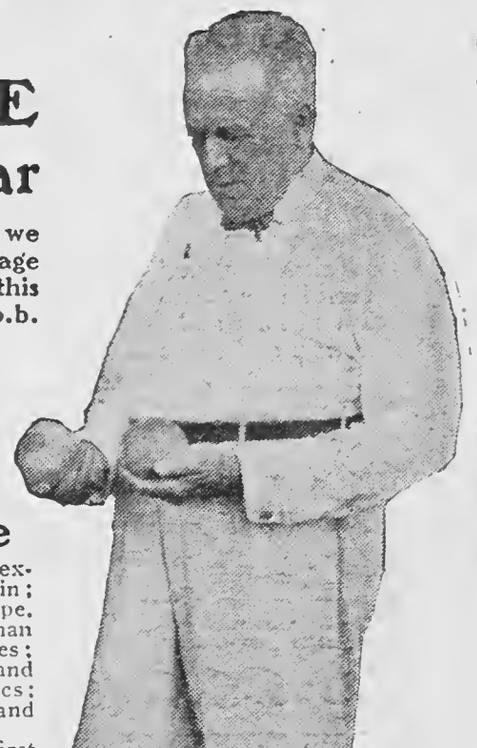
K.

$1420
from 133 J. H. HALE Peach Trees This Year

". . . from one measured acre of 133 trees we picked, September 14th, 748 bushels, or an average of 5½ bushels or 8 crates per tree, over 95% of this fruit being high class merchantable fruit, selling f.o.b. at the farm at $2.00 to $2.50 per bushel . . ."

(Signed) J. H. HALE—in his report on his 1913 crop.

(Figuring on the basis of 95% of the crop from this acre, at the lower price of $2.00 per bushel, the figures quoted above are had.)



J. H. HALE, "The Peach King" Note the enormous size of the peaches in Mr. Hale's hands

Why Such Profits are Possible

The J. H. Hale peach is ½ to ¾ larger than Elberta; extremely juicy; golden yellow flesh, brilliant carmine skin; meat is solid as a cling, yet a perfect freestone; round shape, excellent for preserving; stands shipping much better than Elberta; ripens a week earlier and hangs longer on trees; skin smooth and thick—*almost fuzzless;* hardier in wood and bud than Elberta, Georgia Belle or other hardy peaches; healthy, vigorous grower, withstands severe drouths and still fruits enormously.

And these features, embraced in one peach for the first time in horticultural history, have made the J. H. HALE the greatest commercial peach of America.

You can obtain genuine J. H. HALE peach trees, propagated from buds cut from Mr. Hale's bearing orchards only from William P. Stark Nurseries, Stark City, Mo.

To be *sure* of your trees order now. Hundreds waited last spring until we were oversold. Don't let *yourself* be among the disappointed this year.

Save ½—Buy Direct—No Agents

We have no agents, no salesmen. Every tree is sold direct to you from our great nurseries at Stark City, Mo. Thus you save 30% to 50% in agents' commissions.

Our catalog is our only representative. Prices are in plain figures—lower than you expected to pay. Note the saving under what tree-salesmen ask you. And you get better trees.

EVENTS OF THE WEEK.

DOMESTIC.—Investment bankers were gratified Jan. 29, by the news that the "blue sky" law of Michigan had been held unconstitutional by the Federal Court for the Eastern District of Michigan, Judges Dennison, Sessions and Tuttle deciding unanimously. Three New York firms, N. W. Halsey & Co., Lee, Higginson & Co. and A. B. Leach & Co., were among the several plaintiffs who tested the law. Caldwell, Masslich & Reed, counsel for the Investment Bankers Association, which entered the suit, said that the decision held the law to be an unwarranted interference with the freedom of the individual and beyond the police power of the State.

Warren B. Hutchinson, a patent lawer, of 141 Broadway; William L. Tucker, a promoter, of 135 Broadway, and Morris San, an inventor, were indicted by the Federal Grand Jury in New York, Jan. 29, for nsing the mails to defraud in the promotion of a company for manufacturing childproof matches. The East Jersey Match Company of Garfield, N. J., in which the defendants are said to have sold $140,000 worth of bonds, according to the literature it sent out describing San's scheme was to make "non-sulphurous, non-poisonous matches that could not be lighted save by an adult."

Sylvestro, the Sicilian, was convicted in four minutes, Jan. 29, of attempting to dynamite a tenement house occupied by 25 families, in New York, on August 31, 1913. He was sentenced to imprisonment for three and a half to seven years, but a bill was introduced in the Legislature later making such crimes punishable by forty years imprisonment.

The Old Dominion steamship Monroe, northbound to this port from Norfolk, Va., was rammed and sunk in a thick fog off the Winter Quarter Shoals Lightship on the Virginia coast Jan. 30, by the Merchants and Miners' steamship Nantucket, bound to Baltimore from Boston. Forty-one persons on the Monroe lost their lives. There was no loss of life on the Nantucket. Many of those lost had no opportunity to save themselves, as the Monroe did not stand up more than 12 minutes after she was raked. The vessels came together in the mist. The Nantucket practically sliced the Monroe in two. The survivors say there was no confusion on board either steamship during the brief interval the Monroe remained afloat after the impact. Ferdinand J. Kuehn, the wireless operator on the sinking vessel, sacrificed his chances for life to save a woman passenger. The property loss exclusive of freight and baggage, is estimated at $225,000.

Several thousand barrels of oil and several large tanks of oils, with part of the plant of the Valvoline Oil Company, were destroyed in a spectacular fire at Edgewater, N. J., Feb. 1. The flames, which caused about $300,000 damage, started in the plant opposite 110th street.

The Panama-Pacific Exposition has invited the aviators of the world to circumnavigate the globe. Ninety days will be permitted them in which to make the flight, and the man who wins will get $100,000 for his pains. Then there will be $50,000 additional for other prizes, according to present plans, although it is expected that when the times comes for the start $150,000 more will be added to the prize money.

Joseph Cassidy, political "boss" of the Borough of Queens and Louis T. Walter, Jr., were convicted in the Brooklyn Supreme Court February 2. The charge is conspiracy in having sold to William Willett, Jr., his nomination to the Supreme Court bench in 1911. The maximum penalty is two years imprisonment and $3,000 fine. The case against Cassidy, Walter and Willett arises out of an editorial printed in October, 1911, in the Brooklyn *Standard Union*. Charges were made that one of the Democratic candidates for the Supreme Court bench had bought his nomination. William Berri, owner of the *Standard Union*, was accused of criminal libel, whereupon he set out to prove the allegations in the editorial. The libel suit was dropped, but John Doe proceedings were brought in Queens county before Justice Sendder, sitting as Magistrate, to determine the truth of the allegations. These proceedings resulted in no indictments, and District Attorney Whitman sent his assistant, William A. De Ford, to investigate the matter. Eventually indictments against Willett, Cassidy and Walter were handed down.

The New Jersey House passed, Feb. 3, 49 to 4, the resolution for a State constitutional amendment extending the right of suffrage to women. The resolution now goes to the Senate. If that body adopts it the resolution will have to be passed again by the next Legislature before it can be put to a referendum vote.

President Wilson issued a proclamation, Feb. 3, lifting the embargo on shipments of arms from the United States into Mexico. The President's order contains a word of encouragement for the Constitutionalists and the recognition of Carranza by the United States is expected to follow. The Executive order became effective at once. Arms and ammunition for 15,000 troops are in New Orleans warehouses ready to be shipped to the rebels.

FARM AND GARDEN.—A bill providing for the establishment of a national farm land bank system was introduced in Congress Jan. 29. This measure is tentatively the Administration bill for the establishment of a national rural credit system. It represents the result of the labors of a United States commission appointed by President Wilson last April to investigate the rural credit system in European countries and report thereon. The bill in the form introduced has not the unqualified indorsement of the House Banking and Currency Committee. It represents in the main the view of the committee and so far as the measure's general principles are concerned it has the approval of President Wilson. President Wilson has been positive upon one point in regard to a rural credit system for the United States. He is opposed to any scheme by which the United States Government would become directly the creditor of the farmer. This view is in entire accord with the views of the majority members of the House Committee on Banking and Currency.

Urging the necessity for a division of rural hygiene in the State Department of Health, Dr. Hermann M. Biggs, State Commissioner of Health, points out that the up-State death rate increased last year from 15.5 to 15.8 per 1,000 population, while the death rate in New York city fell from 14.1 to 13.7. The figures show that if the death rate in the rural districts had been as low as the New York city death rate there would have been 7,975 fewer deaths up-State. At Gov. Glynn's recent conference on agriculture and allied matters Dr. Biggs said that rural dwellers have as much right as city residents to the best health protection that modern science affords. He added that the country districts have received little attention from sanitary authorities.

Twenty-one horses, belonging to A. Henry Higginson, were lost in a fire which destroyed the big racing stable on the Higginson country estate at Lincoln, Mass., Jan. 31. Only four horses were saved. The loss is estimated at $60,000.

Prof. Walter Mulford, head of Cornell University forestry department, has accepted the appointment of chief of the new department of forestry in the University of California. His resignation at Cornell will take effect at the end of the present college year and he will begin his duties at Berkeley on August 1.

Prof. Mulford is a graduate of Cornell in both agriculture (1889) and forestry (1901). He was appointed to his professorship here in 1910, when he was a member of the faculty of the University of Michigan.

THE OHIO APPLE SHOW.

The fifth annual Ohio Apple Show, held in connection with the annual meeting of the State Horticultural Society, was the biggest and best ever seen in the Buckeye State. It was held in the commodious Central Armory of Cleveland—a building admirably adapted to the purpose. Apples were exhibited on plates, in baskets of various sizes, in cartons for shipping by parcel post, in trays, in boxes, and in barrels. They were all well colored and free from insect injury or blemish of any kind. There were booth exhibits where artistic effect in arrangement as well as variety and quality was taken into effect. There were also exhibits by countries. Altogether it was a great exhibition of a world-renowned fruit. It established beyond a doubt the continued capacity of Ohio to produce good apples, even in an unfavorable season, and could scarcely fail to invite to the planting of new orchards and the renovation of old ones. One feature that attracted much attention and left a lasting impression, was an immense apple map of Ohio. This map was about 25 feet square, and was a perfect outline of not only the State, but of each of the 88 counties into which it is divided. It took nearly 80 bushels, or about two tons of apples to make the map. It called attention in a new and novel way to the fact that Ohio as a whole is a good average apple producing State, and that good apples can be successfully grown in some parts of every county of the State. It said to those who saw it, "Use the Ohio apple." There is no doubt that the people of Ohio, like those of other States, eat apples too sparingly, and of the apples they buy too large a percentage are grown outside of the State. It said also that no one need apologize for the Ohio apple, except on the score of its rarity, or too often on the score of lack of grading, and to our shame be it said, dishonest packing. There is something wrong when good apples cost more than good oranges, as they do in many if not most of the markets of Ohio. It has been said that the farm orchards in Ohio have been disappearing at the rate of 10,000 acres a year. If this is true it is a deplorable situation. While the loss of farm orchards is being partially balanced by the establishment of large commercial orchards, is there any good reason why the farm orchard should go? There is urgent necessity of treating it better, of making very great improvements in its management. Too often we who have small orchards do little or nothing for them, and are disappointed if the orchard does not do much for us. We do not seem to have learned the lesson that as a rule it is only work thoroughly well done that is generously rewarded. Raising apples is no exception to this stern but salutary law. We may be lacking in the knowledge and skill necessary to good orchard management, but we cannot clear our eyes to the fact that the best orchard management is that which is morally sure to give us the largest and most certain reward. While we rejoice that the apple orchard is sometimes a profitable corner of the farm, the rapid decrease in farm orchards show that too often they are little more than waste land yielding neither satisfaction nor revenue.

In viewing the apple situation in Ohio I have been puzzled by this question: "Would more apples be eaten if more were raised, or would more be raised if more were eaten?" This relation of cause and effect may not be readily determined, but the fact remains that too few are raised and too few eaten. I believe the apple show will tend to correct both of these failures. In connection with the show there was an unusually complete exhibit of horticultural implements, tools and appliances of various kinds. To many this was quite as instructive as the apple show itself, and was a splendid opportunity for manufacturers, dealers and users to get together.

By far the larger part of the premiums awarded were captured by the growers of the northeastern and southwestern parts of the State. This seems to prove that as far as injury by late Spring frost is concerned the lake region in the north, and the higher hills in the south, are the most nearly exempt. The apples that came from other sections of the State were from orchards of unusually good location regarding cold air drainage, or those that were protected by artificial heat.

Among the resolutions adopted was one opposing the 90-day limit of cold storage on apples, and one asking for relief from the game laws that are protecting rabbits, so that they are becoming one of the worst pests in orchard and nursery.

WILLIAM R. LAZENBY.

NEW YORK STATE GRANGE.

The 41st annual session of the New York State Grange was held February 3-6, at Poughkeepsie. It was the largest in respect to voting delegates present ever held, 570. Visitors included, there were probably 1200 in attendance on Thursday when the sixth degree was conferred. State Master Vary's annual address was a clear presentation of the politics of the order as he has attempted to promulgate them during the past two years, and of the conditions and prospects as he views them. A large part of the address was devoted to the trade cooperative efforts of the Grange with specific reference to the State Grange Purchasing Agencies, which he said had done a business of $392,000 the past year, although considerably less than one half of the Granges of the State had patronized it. State legislation was reviewed, and the activities of the Grange as related to our agricultural institutions, the Department of Agriculture, the State Experiment Station, State fair, etc., were recounted. The Secretary's report showed that the total membership of the order in the State on Oct. 1, 1913, was 109,293 and at the present time it is about 110,000. On January 1, 1914, the total number of Subordinate Granges was 838. The receipts of the office were $31,441.49. The treasurer's report showed receipts for the year, including the balance on hand Jan. 1, 1913, to have been about $59,000. It appears from this report that the expenses of the State Grange session last year at Buffalo, were over $11,000. Among the strong Grange counties of the State, Jefferson leads with a membership of about 7,900, Chautauqua closely following with perhaps 100 less. The total net gain in membership for the fiscal year was 4,321.

The following officers were elected: Master, W. H. Vary, Watertown; overseer, S. J. Lowell, Fredonia; lecturer, F. E. Alexander, Pulaski; steward, F. J. Riley, Sennett; chaplain, S. L. Strivings, Castile; treasurer, W. S. Bean, McGraw; secretary, W. N. Giles, Skaneateles.

COMING FARMERS' MEETINGS.

Sixth National Corn Exhibition, State Fair Grounds, Dallas, Texas, February 10-24.

Granite State Dairymen's Association, Concord, N. H., February 12.

Massachusetts Agricultural College, Amherst, ten-weeks' Winter course, January 6 to March 13.

Thirty-ninth annual meeting of the American Association of Nurserymen, Cleveland, O., January 24-26.

A KINDERGARTEN teacher had been very strict in requiring written excuses from the mothers in cases of absence. Willie's mother was quite annoyed. It seemed to her that anyone with the slightest pretensions to gray matter ought to know the reason for his absence. The next morning he arrived all rosy with the cold and handed the teacher his excuse. It read: "Dear Miss C.——, —Little Willie's legs are fourteen inches long. The snow was two feet deep. Very truly your, Mrs. J——."—Credit Lost

Overland $950

Completely equipped
f. o. b. Toledo

Costs You 30% Less—

THE man who buys without comparing or analyzing only succeeds in grossly fooling himself. The better you acquaint yourself with values the more intelligently and economically you can buy.

If, in one car, you can get a longer wheelbase for less money then *that* car offers a greater value.

If, in one car, you get a more powerful motor for less money then *that* car offers you still greater value.

If, in one car, you get larger tires for less money then again in *that* car you get an additional value.

And so on throughout the entire car. If the fundamentals are larger, better and more powerful and the purchase price is less, which does it seem reasonable to buy?

The closer you make such an investigation the better the Overland shows up—and the harder it is on our competitors. Why is it you seldom see any of our competitors advertising their specifications? Are they afraid or ashamed?

Be that as it may, here are the facts:

The $950 Overland has a motor that is as large and as powerful as in most $1200 cars. *Compare and see.*

The $950 Overland has a wheelbase as long as on most $1200 cars. *Compare and see.*

The $950 Overland is roomier, has greater leg stretch and more actual comfort than most $1200 cars. *Compare and see.*

The $950 Overland has tires as large as on most $1200 cars. *Compare and see.*

The $950 Overland has electric lights throughout, the same as $3000 to $5000 cars. *Compare and see.*

The $950 Overland has just as complete and just as expensive equipment as most $1500 cars. *Compare and see.*

The $950 Overland is just as superbly and richly finished as any $1500 car. *Compare and see.*

The $950 Overland is manufactured just as carefully as any car. *Compare and see.*

And such greater value for less money is possible on account of our enormous and therefore economical production methods, because we are the largest manufacturers in the world of this type of car.

Why hesitate? There are more Overlands being sold today than any other competing car made. And this is because we continue to give more standard car for less actual money.

The purchase of an Overland will save you a clear 30%.

Get in touch with the nearest Overland dealer. Handsome catalogue on request.

The Home Acre.

NOTES FROM A MARYLAND GARDEN.

The garden has been heavily covered all over with old rotten manure, both on the vacant ground and between the rows of the Winter crops of onions, spinach and kale, and now this will be supplemented with an application of 1,000 pounds an acre of a mixture of eight per cent phosphoric acid and 10 per cent potash, for my sandy soil needs the potash. And right here is where a great many people fail with their gardens. I had two letters this week from people asking advice about their gardens. Both of them said that the garden was very rich, and they have been covering it with stable manure every Spring for years. But they said that Irish potatoes make tops of immense size and no potatoes; that Lima beans made wonderful vines and set full of pods which shrivelled and dropped, and onions all went to scallions. They had been dosing the garden with nitrogenous matter with very little of the seed-forming and bulb and tuber-making mineral matters. That is, they had got the soil rich in nitrogen, and had for years been using up the phosphorus and potassium.

I try to keep up a balance in the plant food, and have no such difficulty. My Irish potatoes make immense vines, and make potatoes too. My Lima beans grow wonderfully, and bear loads of well-filled pods, simply because the plant foods that are needed for the making of starch are there, and starch is an essential thing in making seed and potatoes. We are getting now lettuce from the frames on which I have the double-glazed sashes, which need no mats. Then outside we are getting salsify, spinach, leeks, kale and carrots, all of which I leave in the ground where they grew, and lift them as wanted. Leeks we are fond of, and they take the place of the green onions until we get the onions in March.

I have two varieties of onions planted last Fall. The earliest green onions we get from the Norfolk Queen. This is a flat white onion, larger than the Queen of the northern catalogues, and makes the earliest green onions. In mild Winters they are often large enough here to use in February and always in March. The other variety is the Yellow Potato onion. These make no seed, but increase by offsets. These can be pulled in April for green onions, and they make a fine succession to the Norfolk Queen, while the main bulbs will ripen into very large onions. The Norfolk kale is better than the green Curled Scotch in eating quality, and I now grow it only, though the Scotch will make the heaviest crop. Part of my spinach was sown in late August, and has been giving us fine cuttings all the Fall. The remainder was not sown till October, as we wanted it simply to get large enough to winter over and make growth in the Spring. I never sow spinach in the Spring, but sow chard as a Summer substitute. We can pull the leaves of the chard as soon as they are as large as ordinary spinach leaves, and it is hard to distinguish these young leaves from spinach when cooked. But I always sow plenty, in rows like beets, for the plants that are allowed to develop full-sized leaves make long leaf stalks, and these are pulled off like rhubarb and trimmed and cooked and dressed like asparagus, and make a very fine dish.

Down here the large White Lima bean is never very productive, and for a climbing bean we use the Small Lima or Sieva, which in fact I consider a better table bean than the large ones. But we have the largest of the large ones in the Fordhook Bush Lima, which bears the thick or potato Lima beans, and is very productive. But it will not do to crowd them in the rows like the string beans. They make stout plants, and productive ones only when given a foot in the row. The crop now being planted in the frames, or rather crops, are the Prize-taker onions, for transplanting in March. Then under the double-glazed sashes we sow radishes and beets in alternate rows six inches apart, and the radishes come out before the beets need the room, and in March the beets are hardened and the sashes removed to other frames, in which the tomato plants are spotted out from the greenhouse.

My rule for sowing early tomato seed anywhere is 10 weeks before it is usually safe to set them in the open ground, which means here from 15th to 20th of February. But last Spring we came near having a disaster with them, for we had a freeze May 11. It was Sunday night, and returning from church I found that there was sure to be frost, and with shovel and lantern I went to work and bent the tomato plants over carefully and shovelled the soil over them, and saved them, though the mercury in the morning stood at 28, a most unprecedented thing here in May. One row of string beans was saved also.

In the flower garden I find that Dahlias keep safer buried outside. I dig a shallow pit, cover the bottom with straw, and pack the roots in, and cover them thickly with old newspapers, and then mound the soil over them in a sharp heap to shed the rain. Last Spring when I removed the earth and the papers I found them all started with shoots five inches long. Cannas need a little more heat, and I keep these in the cellar in the farther corner from the hot-water boiler, and I keep thousands of Gladioli in the same cellar, as far away from the boiler as possible. My main crop of Fall-planted bulbs is the Candidum lily. These are planted in September, as it is necessary for them to make a rosette of green leaves for the Winter.

My first planting of Sweet peas was made on the 21st of January. A trench a spit deep was dug along a wire netting fence, and filled half full of old rotten manure, covered slightly, and the peas sown and covered about five inches deep. More are yet to be sown as soon as there is a favorable spell, for we must get these in early, so as to get them in bloom before the weather gets too hot.

Maryland. W. F. MASSEY.

EBELING'S HARDY SEEDS

Greater vitality because grown in a colder climate.
Imported AUSTRIAN 2-ROW BARLEY. Weight 56 lbs. to measured bu. Stiff straw. No lodging. Each kernel stools 3 to 6 stalks. Sow 1½ bu. to acre. 1913, an "off" year grew 55 meas. bu. to acre. Equal to nearly 65 bu. weight. Price $2 bu.
WINNIPEG CLUSTER SEED OATS—Canada grown. kernel very fat, 46 lbs. to bu. World's greatest yielder, $2 bu. Other tested seeds of high germinating qualities. Telephone Peas and Garden Seeds at special prices. American-grown Alfalfa, tested in Washington — 99.94 pure. Genuine Eureka Ensilage Corn, Pedigree Pride of North, Leaming, Iowa Gold Mine, Spring Wheat, Rye, Vetches, Green Soy Beans, Maine-grown Seed Potatoes, Timothy, Clover and Alsike of the highest purity. All freight prepaid. Special quantity prices on application. Write for free illustrated 90-page catalog—everything for the farm. Pkts. of Pansy and Alyssum for 5c.

DIBBLE'S SEED OATS

Northern grown and thoroughly recleaned are the kind to grow for profitable crops.
Dibble's New Heavyweight introduced by us as the most productive variety with heaviest grain grown in America, has made good. A Connecticut customer writes: "grain weighs 44-46 lbs." One from Vermont: "Over 117 bushels per acre." And one from Ohio says: "Heavyweight yielded just twice the amount of other kinds."
We offer for seed just 6,000 bushels. One crop from a field that produced 118 bushels by weight, grain weighing 43½ lbs. per bushel.
100-lb. bag, $3.00; 10 bushels, $9.00; 100 bushels, $80.00. Bags free.
Dibble's Twentieth Century. On our own farms for past nine years growing 100-200 acres each season, has produced over twice the average yield for the United States for the same period.
2½ bu. bag $2.50; 10 bu. $8.00; 100 bu. $70.00. Bags free.
HEADQUARTERS FOR FARM SEEDS. Dibble's Farm Seed Catalogue and ten samples Dibble's Farm Seeds mailed FREE to every Farmer. Address

Fowler's Solution of Arsenic.

I see you advise frequently the use of Fowler's solution. What is Fowler's solution and how does it operate? Is it ever used for human ailments and which if any? M. N. G.

New York, N. Y.

Fowler's solution is a liquid preparation of arsenic; chemically it is a solution of the arsenite of potassium. It has the properties of arsenic, and is a convenient means of administration of that drug. It is a valuable drug, much used in medicine, but is a powerful irritant and depressant poison in overdose, and should never be taken or given except under the direction of a competent physician. Its chief field in human medicine is in certain skin diseases, in some nervous affections, and, combined with iron, as a tonic, or tissue builder. Given to horses with heaves, in proper dose, it relieves the symptoms of that disease.

M. B. D.

Bearing Age of Apples.

What are the relative ages at which the principal commercial varieties of apples come into bearing? Of course I understand that the actual ages at which they come into bearing depend a great deal on the locality, soil, care, etc., and perhaps this is true to some extent of the relative ages also, but generally speaking, I suppose it may be said that certain kinds are early bearers, other kinds medium, others late. Some of the varieties I should like specially to know about are Winesap, Stayman, Arkansas, Rome Beauty, York Imperial, Jonathan, Grimes, Newtown, Hoover, Bonum, Ben Davis, Delicious, King David, Senator, Paragon, Wealthy, McIntosh and Hubbardston. Will you arrange the above varieties approximately in the order of the ages at which they may be expected to come into bearing in this climate, under reasonably good care? R. P. J.

Almost any variety of apple or other fruit will vary in the time of coming into bearing according to the conditions under which it is grown, but, as R. P. J. states, there are well-established records of the behavior of most of the principal apples at least. It is very well proven by many years of testing that all varieties of the apple begin to bear earlier in the regions beyond the Rocky Mountains than anywhere east of them by about two or three years. In the prairie regions of the Central States the apple trees come into bearing a year or two earlier than in the regions from Ohio and Michigan eastward. The particular varieties mentioned in this list are nearly all about medium in point of time of bearing age. The Wealthy is the only very precocious one, and the Newtown the only really tardy one. Without consulting a recorded list from actual experience they will stand as follows in the Central States: Four years from planting, Wealthy; six years from planting, Winesap, Stayman, Arkansas, Paragon, Rome Beauty, Bonum, Delicious, King David, Senator, McIntosh, Grimes, Jonathan; eight years from planting, Ben Davis, Hubbardston, York Imperial; 10 years from planting, Newtown. From these figures anyone can calculate that they will bear two years earlier in the western regions and that much later to the eastward. By these estimates it must not be understood that there are not many minor variations and that there will be a few specimens borne at earlier dates. That there may be light commercial crops about at the times indicated is reasonable to be expected.

H. E. VAN DEMAN.

Diseased Cauliflower Plants.

Will you give the cause and remedy for cauliflower plants stopping growth, the edges of the leaf turning brown? I sow seed in a well-prepared ground outside from the 10th to the 25th of May, and usually have to sow more seed than is necessary, because the affected plants cannot be depended upon. Different parts of the bed are usually affected, while the rest of bed are as nice as could be wished for. L. W. J.

Solon, O.

From the description given of the diseased plants it appears they were attacked by stem-rot. This disease has been more or less destructive in Ohio and several other States for over 20 years. During that time it has become pretty well distributed throughout the State. The spores are usually distributed by crawling insects (slugs being the principal offender) carrying the spores on their bodies from the diseased plants to the nearby healthy plants, which accounts for the disease appearing in patches instead of rapidly spreading to all parts of the bed, as would be the case in the attacks of most fungus diseases in plants. So far no sure method of controlling this disease has been discovered; nothing but clean soil and manure should be used in the seed bed, and as an extra precautionary measure, either the seed or soil or both should be disinfected before sowing. The following method of soil sterilization in the seed bed, is recommended by the Ohio Agricultural Experiment Station, for the successful control of the disease. Treat the seed bed immediately after sowing the seed with a solution of Bordeaux mixture (4-4-50 mixture) at the rate of one gallon to 10 square feet of surface. In addition to this the beds should be sprayed with Bordeaux about two weeks before and again just preceding transplanting into the field. K.

Whole-root or Piece-root Trees.

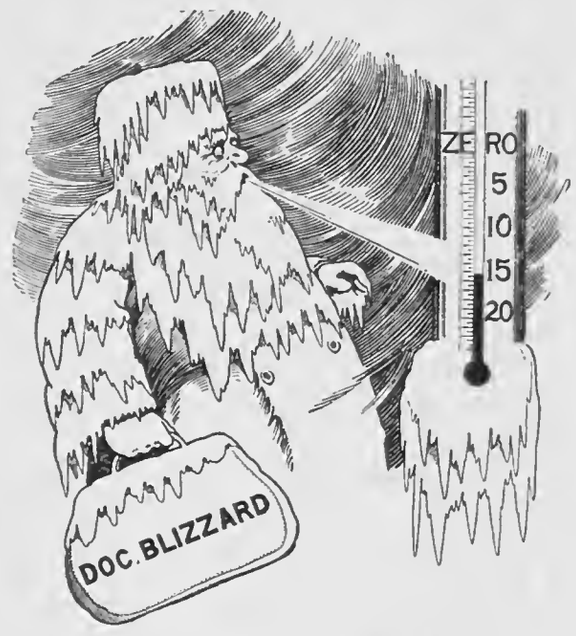
I am intending to plant an apple orchard, and would like your opinion as to the best trees to plant, whether whole-root or piece-root. R. S.

Kevil, Ky.

There has not been much said lately about the whole and piece-root theories. It is true according to my own experience that the better trees are grown from grafts put on the upper six inches of good seedlings than from the ordinary piece-root grafts. I tried this out in Kansas many years ago, by making up a lot of root-grafts on pieces of roots from two inches to 12 inches long. The trees produced from the upper six inches were decidedly better than those from the lower six inches, or from any other length or part of the same grade of seedlings. The trees grown from the full-length roots or those a foot long were no better than those from the upper six inches of the same grade. Nurserymen do not grow trees from full-length roots, or at least not many do so commercially and I really doubt if any do. They usually call the trees they grow from the upper cuts of the seedlings about six inches long "whole-root trees" and those who really grow them in this way may justly claim that such trees are superior to ordinary piece-root trees. Trees grown by budding on seedlings in the nursery rows are whole-rooted, and are often considered superior to ordinary trees as sold by nurserymen. H. E. VAN DEMAN.

Heat that defeats blizzards!

When the blustering blizzards of old winter force the mercury below the zero line and attack the windward sides of your home, if you have placed your trust in old-fashioned ways of heating you sadly discover how non-dependable they are! Even while rough winter buffets your house with bleak blasts—you can stop the affliction (in a very short time and without disturbance) by putting in a blizzard-defying outfit of



The test time of good heating!

AMERICAN RADIATORS & IDEAL BOILERS

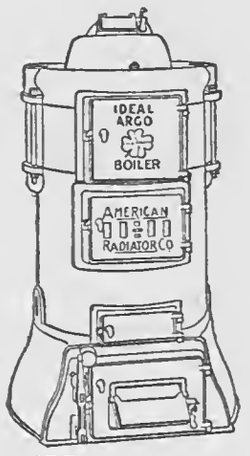
IDEAL Boilers and AMERICAN Radiators are carried in our warehouses in all the large shipping centers of the United States. An outfit can be quickly installed without interfering with old stoves or heater, which remain in service until the IDEAL Boiler is fired up and making your home delightful all over. *Act now, before the zero days and high winds!*

The operation of an IDEAL-AMERICAN outfit is not affected by outside weather conditions; for, be there calm or storm, there is a constant circulation of heat within the piping and radiators, which is *positive*—as sure to carry steady heat to the windward side of the home as to protected rooms; all rooms, halls, bath-rooms, bays and corners are uniformly comfortable.

In IDEAL Boilers the rich coal-gases are burned and turned into heat for the rooms, rather than escaping up the chimney (which means fuel-waste.) No dust and dirt thrown into the rooms; much cleaning labor is saved to the women. A century of use will not wear out these heating outfits. Once kindled, the fire lasts all winter—8 to 16 hours between coalings, according to weather conditions. Need not be connected to water supply, as same water is used over and over for many years.

A No. 4121 IDEAL Boiler and 420 sq. ft. of 38-in. AMERICAN Radiators, costing the owner $210, were used to heat this cottage. At this price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which are extra, and vary according to climatic and other conditions.

The blizzard-defying, reliable character of IDEAL-AMERICAN heating, its fuel-economies and long-wearing qualities, make the purchase a solid investment. Drop us a line today and tell us the needs of *any* building in which you are interested—farm or town—cottage, church, school, store, etc. Booklets and special information are free—you incur no obligations by asking us questions.



IDEAL Boilers have no parts to wear out; give sure heat control and save heavily in fuel.

LITTLE GIANT SPRAYERS

Light
Rigs With Lots of Power

WE make a complete line of Sprayers for Orchard, Field and Vineyard, both Hand and Power Types. Built to stand up under hard work, and so constructed that they put the spray where you want it, and combine maximum power and strength with minimum draft weight, so that they won't kill horses on rough, heavy ground.

Little Giant Orchard Power Sprayers

are built in two sizes with tanks of 200 gallons and 100 gallons capacity. Both are equipped with a special pump of our own make, especially powerful, easy working, and so simply constructed that every part is accessible.

The Pump With The Clutch

is a Little Giant feature. By throwing out the clutch the pump may be stopped without stopping engine or interfering with agitator. It's a great advantage to be able to crank the engine without having the pump attached. You can also mix your solution thoroughly before starting spraying.

Little Giants are giving extra satisfactory service to many growers. It will be worth your while to write for our catalog and prices.

THE RURAL NEW-YORKER,
333 West 30th Street, New York City.

The Home Acre.

BEAUTIFY THE RURAL HOME GROUNDS.

In the beautifying of the rural home grounds, the development should be conducted along lines that will produce a harmonious and pleasing effect. The style of development will depend much on the size of the area to be improved, the character of the soil, climate and the amount one can afford to expend for the purpose. Three styles of improvement are employed in landscape work, formal, informal or natural, and a combination of both. The size of the ground to be improved, together with the other important features mentioned, will in a great measure determine the style of improvement that can be most appropriately employed. For small places of less than an acre, particularly when situated among others of like dimensions, the formal style will in most cases be the more appropriate, whereas estates of larger dimensions should have the informal style of treatment, or a combination of both styles may be employed as seems best suited to the circumstances. When the home grounds are undergoing improvement, it should be the aim of those in charge of the work to arrange the planting of trees, shrubs, etc., as harmoniously as possible, making the contrast between the different species of trees, shrubs and flowering plants show to the best advantage, as it is the habit of growth, color of foliage or flowers, that serve in bringing out prominently the individual beauty of each, when grown together. Therefore they should be so arranged, whether planted in groups or singly, that a group or individual of any species of tree, shrub or flowering plant will not be out of harmony with its associates, or out of adjustment with the contour of the place.

Nature is our best teacher, and in the arrangement of the various plantings, etc., nature should be imitated as closely as possible, particularly when the area is large enough to admit of the informal style of improvement. Small places, on account of their limited area, will make the formal style of treatment necessary, in most cases, as the limited room will not admit of curved driveways, walks or irregular outline to the margins of the shrub and hardy herbaceous flowering plant borders. However, beautiful and pleasing effects can be produced, even on a town lot, though the lines of drive, walk and plantings are straight; therefore let not the smallness of the ground act as a deterrent to their improvement. The expense of improvement would be so small as to seem almost unworthy of consideration, when compared with the great pleasure that will be enjoyed by the owner, and the greatly enhanced value of the property, because of the improvement. Every rural home should be surrounded by as many trees, shrubs, vines and hardy plants as can be appropriately used in the adornment of the grounds. Harmonious and pleasing arrangement of the home surroundings will go far in maintaining harmony in the home. No home should be without either. K.

We have just had an old-fashioned January thaw, which has taken our sleighing, leaving wheatfields and meadows quite bare. A large number of logs have been hauled to mill during sleighing. Icemen have cut a good quality of ice. Stock is doing well. Cabbage has not been very renumerative when we consider the light yield per acre of Danish. Apples are not keeping very well. Hens are on strike, giving but few eggs on good feed. The most senseless and unjust law that has been introduced in the Senate is that in 1917 all sleighs shall be altered to four feet eight inches in width, just to accommodate the autos. Won't that be a blessing to the poor man? We have had to alter our wagons to wide tires, and they have taken the breakwaters off the hills, which should never have been done, as the heavy rains are washing the roads badly. We old hayseeds have always had to ride over them, why not the auto? What will they want next? We certainly have high taxes out of the operation and road graft put in for filler. When will the farmer have justice? E. F. B.

GREAT CROPS OF
STRAWBERRIES
AND HOW TO GROW THEM

IS the title of a beautifully illustrated book of expert information written in every-day language by America's most successful strawberry grower. It explains how the Kellogg Pedigree plants are grown on the great Kellogg plant farms in Oregon, Idaho and Michigan. It contains pictures of the best varieties of strawberries, including fall-bearing kinds, and gives full descriptions. It tells how to grow big crops of fancy berries, and how to market them at big prices. Explains in detail The Kellogg Way.

OUR FAMILY STRAWBERRY GARDEN

Whether you have a small garden only or a big farm, you should grow your own strawberries. Kellogg's Big Red Strawberry Garden will produce all the delicious strawberries your entire family can eat, summer and winter. You can have shortcake, strawberries and cream, preserves, jam and canned berries, the year 'round for less than one cent per gallon. Our Book gives full information.

Strawberries yield more dollars per acre and give quicker returns than any other crop. Set one acre to Kellogg's Pedigree plants this year, and put from $500 to $800 in the bank next year. Our Book tells you how. IT IS FREE.

Summer and Fall Bearing

Headquarters for Strawberries and Small Fruit Plants of all kinds. Raspberries, Blackberries, Currants, Gooseberries, Grapes, Fruit Trees, Roses, Shrubs, Eggs for Hatching, Crates, Baskets. Catalog.
L. J. Farmer, Box 420, Pulaski, N. Y.

Grow This Berry for big profits and sure yields. It is hardy and wonderfully productive, coal black and very large, almost as thick through as long. In luscious flavor it surpasses by far all others I have ever grown. In my long experience with this berry its canes have never been affected, even slightly, by orange rust or other fungus disease, and I believe it immune to them.

The "JOY" BLACKBERRY

brings joy to all who grow, sell or eat it. It is immensely profitable to the market grower, and "a joy forever" to the amateur gardener. The canes are of iron-clad hardihood, need no staking, and are literally loaded with fruit every year. I know this berry thoroughly and willingly stake my reputation upon it. Illustrated catalog replete with cultural instructions, free to everybody. Established 1878. 200 acres. Quality unsurpassed, prices low.

J. T. LOVETT Box 162 LITTLE SILVER, N. J.

What to Do With "Hard" Water.

I would like to know what I can do to soften "hard" water. My artesian well has good drinking water, but for washing and bathing purposes it is too "hard." My wife uses soda, ammonia and numerous softening agents without much benefit, and the use of these agents has "cut" her hands and fingers considerably. This latter feature I am more desirous of eliminating than anything else. Can you help me? A. H. K.
Bound Brook, N. J.

The "hardness" of water is usually caused by the sulphates and carbonates of lime and magnesia. It is due, in the case of well water, almost entirely to the absorption from the limy or chalky strata through which the water flows. Deep well waters are more often affected than shallow wells, because the water of deep wells frequently flows for many miles through such a chalky layer, while the water of shallow wells has not, as a rule, flowed underground for any great distance. Much of the hardness—that called "temporary" hardness—may be removed by boiling and filtering or straining. It may also be removed by adding lime water and allowing to stand a while and then filtering or straining. If, however, the hardness is "permanent," there can be nothing done other than what you have already done. That is, carbonate of soda (washing soda), borax or ammonia must be added and the water then boiled and filtered. You may have stopped after adding these things, in which case not much benefit is found. The addition of soda, borax or ammonia merely changes the sulphates to carbonates and these carbonates must then be removed by boiling and filtering or by adding lime water and filtering. If large quantities of the water are used, instead of filtering, leave the water standing in a barrel or other container for 24 hours, allowing the precipitate to settle at the bottom. R. P. C.

Fire Extinguishers.

Can you give the formula for a fire extinguishing solution using carbon tetrachloride as a component part? Was this the solution (used in bottles) that was so much advertised a number of years ago? T. S. B.
Hammondsport, N. Y.

Although I am acquainted with the formulæ and construction of about 50 different fire extinguishers, I do not know of any containing carbon tetrachloride. Your inquiry concerning a much advertised solution of some years ago is too indefinite for a certain answer. The Babcock extinguisher was much advertised, but so were many others. Perhaps the Babcock was more spoken of and pushed than any other, so I will give its construction. There are two substances contained within the reservoir, an acid, usually sulphuric acid, and a second chemical, usually a solution of bicarbonate of soda in water. These are kept separate normally, but upon inverting the reservoir, the acid flows upon the bicarbonate and carbonic acid gas is generated, giving sufficient pressure to throw the whole contents from the nozzle of the little hose, with a great deal of force. Carbonated water is always a splendid substance for fire extinguishing purposes, because it has not only the effect of water in general, but it also liberates carbon dioxide which, of itself, is efficient. The idea back of almost all of the extinguishers, whether solutions or grenades, is to liberate gas which does not support combustion. That is, the supply of oxygen is choked off from the fire. That is really the only way of stopping a fire. It is the purpose of water, but when water is thrown on oil, for example, the oil floats on the water and still burns because it has access to the oxygen of the air, but if sand or earth is thrown upon the oil, air supply is cut off and the burning ceases. R. P. C.

How to Tan a Hide.

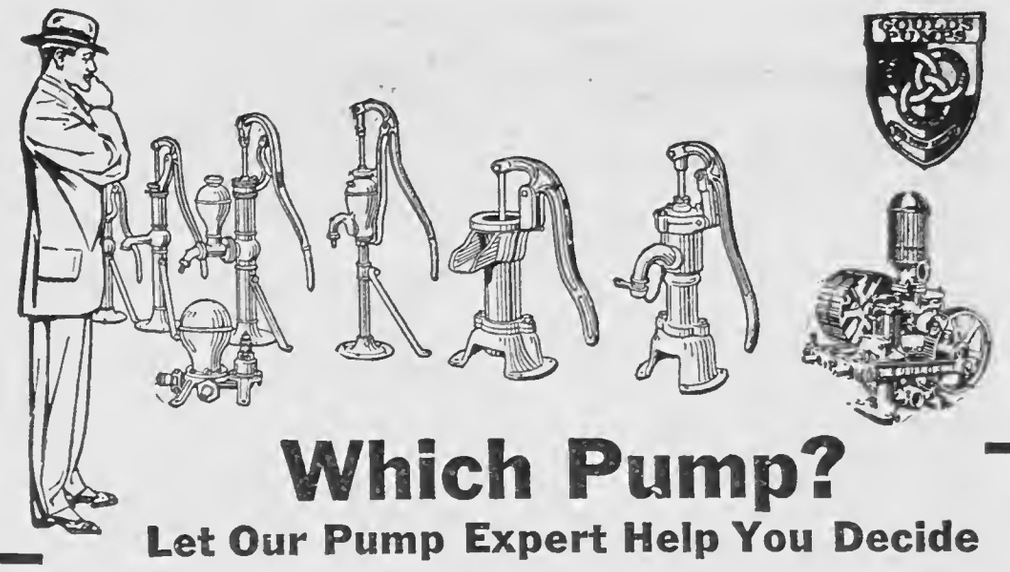
Will you give me the proper method in preparing muskrat skins and pelts of that nature for a coat lining? C. W. M.
Methuen, Mass.

The following method has given satisfaction to many of our readers: It is a method applicable to all skins with the fur on. First trim off all useless parts, then remove all fatty matter from the inside. (If the skin is dry, it must first be softened by soaking.) Next soak the skin for an hour in warm water. After this, spread over the inside of the skin, by means of a brush, a coating of the following mixture: One ounce borax, one ounce saltpetre, one ounce glauber salts (sulphate of soda). Water sufficient to make a thin paste. The coating should be heavier on the thicker parts of the skin; double the skin together, coated side inwards, and put it away in a cool place. At the end of 24 hours apply, in the same manner as before, a coating of a mixture consisting of one ounce sal soda, one half ounce borax, two ounces hard white soap. Melt these together slowly by heat, without allowing the mixture to boil. After coating the skin with the above, fold it together again as before, and put it in a warm place for another 24 hours. At the expiration of this time, take four ounces alum, eight ounces salt, two ounces saleratus. Dissolve these in hot water sufficient in quantity to saturate the skin; when cool enough not to scald the hands, soak the skin in it for 12 hours; then wring it out, and hang it up to dry. The soaking and drying must be repeated two or three times, until the skin is sufficiently soft. Lastly, smooth the inside with fine sand-paper and pumice stone.

Handling Crimson Clover.

Do you think it will pay us to sow Crimson clover with oats early in April? The oats are to be cut just as soon as fit for hay, the clover later, to be plowed in, so that we can grow turnips or other root crops. We would top-dress the oats lightly with stable manure. The land is fairly loaded with humus now. J. I. N.
New Jersey.

No, it will not pay to sow Crimson clover in the Spring. You would hardly get the value of your seed back. This is not a Spring clover. It should be seeded in late Summer if at all. When seeded in Spring it will stop growing, head up and die when hot weather comes. Sow Canada field peas with your oats, cut the combined crop for hay or green fodder, and plow under the stubble for your later crops.



Which Pump?

Let Our Pump Expert Help You Decide

Out of 300 different types of pumps it's hard to pick the very one you need. Get expert advice. Write our Mr. Gould, in charge of our Consultation Department. He will gladly help you, without charge, without obligation. His experience will surely save you money and vexation. Before you buy any pump or water system, find out about

GOULDS RELIABLE PUMPS

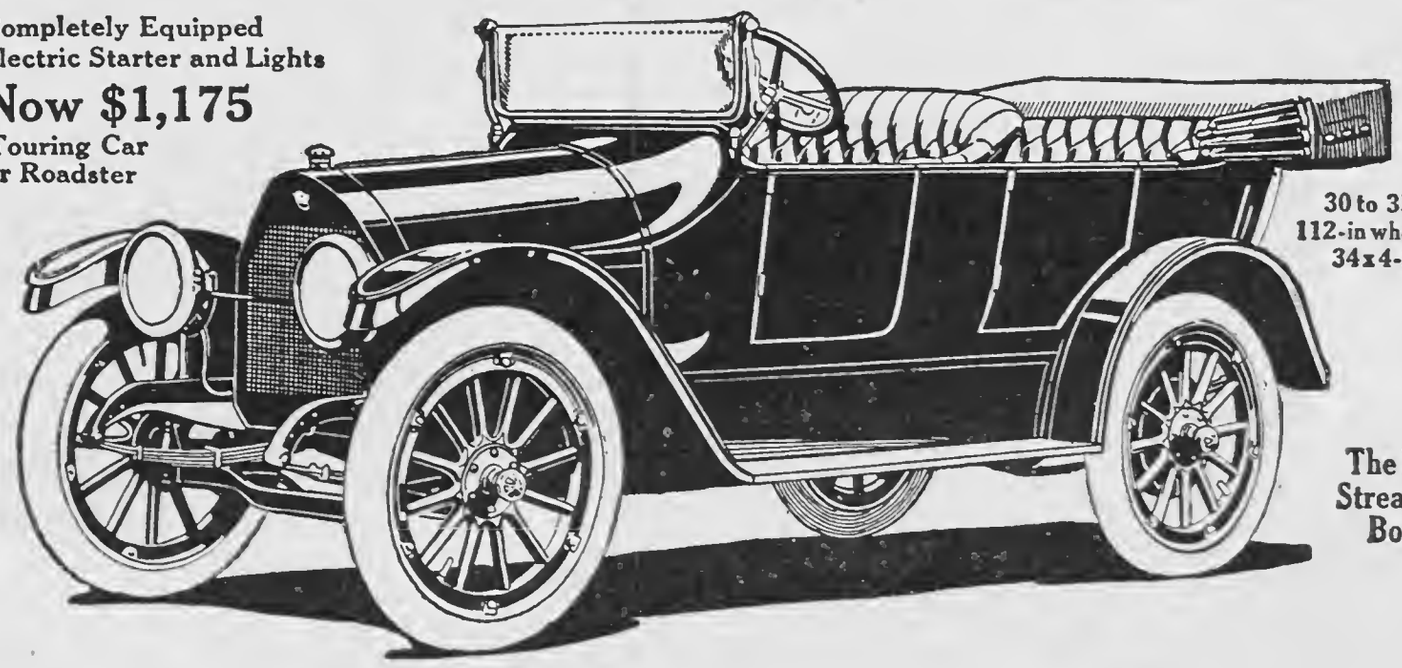
Reo the Fifth 1914 Summer Series $220 Less

Completely Equipped
Electric Starter and Lights
Now $1,175
Touring Car or Roadster



30 to 35 h. p.
112-in wheel base
34x4-in. tires

The New Streamline Body

Mr. R. E. Olds has now done what he aimed at when he brought out this final car. By confining his output for years to one model, he has brought down the cost over 16 per cent.

Up to this season, Reo the Fifth sold for $1,395 completely equipped, with electric starter and electric lights. Now, with this new streamline body, with better equipment, with 36 improvements, the price is $1,175 equipped.

How He Did It

Three years ago Mr. R. E. Olds brought out Reo the Fifth as his 24th model. He then announced—after 25 years of car building—that this car marked his limit.

This new chassis, like every new chassis, required an immense investment. New automatic machinery, new jigs and tools. And against each car a charge was made to cover this expense.

This Car jumped at once to an enormous sale, and that machinery investment has been all wiped out. Now this charge is deducted from the price. Also the lower tire cost. Also the lower cost of electric equipment. As a result, we now announce this $220 reduction.

The New Things

This year we adopt the beautiful streamline body. All the leading cars, both in Europe and here, are now coming to this type.

All instruments and gauges are set flush with the dash. We use a ventilating, rain-vision windshield. The car comes equipped with electric starter, electric lights and electric horn. The searchlights have dimming attachment.

There are in all 36 new features, most of them in beauty and equipment.

An Honest Car

Reo the Fifth has stood among all men as the highest type of an honest car. All the steel is made to formula. All is analyzed twice. Every driving part, as a margin of safety, is given 50 per cent over-capacity.

The gears are tested in a crushing machine for 75,000 pounds per tooth. The springs are tested for 100,000 vibrations. The car has 15 roller bearings, costing five times as much as common ball bearings. It has 190 drop forgings to avoid the risk of flaws.

It is built slowly and carefully, with countless tests and inspections. Each car is built as though Mr. Olds were building it for himself. So the car stays new. The upkeep is very small. Year after year, when other cars grow troublesome and noisy, Reo the Fifth keeps new.

It is built for men who want the utmost in a car. Men who want low cost of upkeep. Men who buy the car to keep. It could be built for about $200 less without all these precautions.

And it has our exclusive one-rod control. No levers in the way.

A thousand dealers sell Reo the Fifth. Write for name of nearest dealer. Also our new catalog.

Reo Motor Car Company, Lansing, Mich.

Canadian Factory, St. Catharines, Ont. Canadian Price, $1,575.

LEGAL NOTES.

Specific Performance of Contract.

An aged man and wife, know as A, bought a tract of land from a party known as B. A paid for the land last July, but never received a deed, being put off from time to time. A has erected and paid for a house and home on said land, which is in New Jersey, and now resides there. A does not believe any wrong is intended by B. What, if any, action could A's sons take to secure their parents the deed, they having discovered the state of affairs? B. C.

It is not stated whether the contract for the purchase of this land was oral or in writing. If it was an oral contract for the purchase of property, it was not good in New Jersey, unless performance on the part of A has taken it outside the statute, and if A has taken possession and made payment and erected a house, he is then in a position to compel B to perform his part of the contract and deliver a deed, and this should be done by an action in which A is plaintiff and B is party defendant, to compel B to deliver a deed to A. Of course, if it is a family affair, it would be much better if it could be settled up without beginning an action, and this method should be tried first.

Telephone Rates.

Some time ago I read in some paper that the Bell Telephone Company had brought suit against a person who had a telephone in his office or residence, and had made an extension to the same for his own use, which the telephone company objected to. The matter was taken into court, and I believe was carried to the higher courts, and finally decided in favor of the subscriber, with the remarks that "the subscriber had paid for the use of the 'phone on his premises and he had the right to make extensions for his own use if he so desires." Can you give me any information along this line, and cite me to any case of the kind that has been decided in the courts? C. C. T.

Pennsylvania.

Careful search and inquiry does not reveal any case holding as this subscriber sets forth. It would seem hardly fair to the telephone company to allow a subscriber in reality to have two 'phones when he is only paying for one. Inquiry at the head office of the telephone trust in regard to decisions of this kind was made, and was met by the statement that no such decision had been given anywhere in the country, and that if such a decision had been made, it would be known by them immediately. They made the statement that if an extension of this character were put in, the contract of the subscriber would be violated and both 'phones would be taken out.

Claim of Judgment Creditor Under Foreclosure.

1. When a party sues another to recover a sum of money, and the court grants judgment to the plaintiff (a), is the judgment recorded, and who records the judgment? (b) Must the plaintiff who has secured judgment record it at his own expense. I understand that when there is a judgment against a property, if said property is sold, the party selling cannot give a clear title until the judgment against it is paid. I have a judgment against a party whose property is already encumbered with two mortgages. I have learned that one of the mortgagees has foreclosed, and bought the farm in, but I have received no information regarding the judgment, nor check to cover it from the court. 2. A property on which I have a judgment has been sold; what steps must I take to look after my own interests, and secure the cash granted me by the court? I also took out a lien on the property.

New Jersey. M. O. N.

1. (a) The judgment is recorded and it is done by the plaintiff. (b) He must record it at his own expense primarily, but the costs may be taxed against the defendant and will by that much increase the judgment. In the event that the property is sold under foreclosure of the first mortgage, of course the first mortgagee is entitled to his pay first because his lien is first and then the second mortgagee and the judgment creditors in the order of priority of their liens, and if there is sufficient money left after the sale to pay the second mortgage and the various judgment creditors, of which yours is one, you will receive your money, but if there is not and the other liens are ahead of yours, you of course will not receive any. If there are two mortgages on the property there is very little chance that the judgment creditors will receive anything from the property.

2. The above answers your second question. You must be made a party defendant and you would participate in the surplus money proceedings if there is any surplus after paying off the mortgages and the costs of the foreclosure proceedings. If there are two mortgages on the property there will probably not be anything left for the judgment creditors.

NEW YORK STATE NEWS.

THE TILDEN MEMORIAL CELEBRATION.—In accordance with the special act of the legislature the Tilden Memorial Commission prepared a fitting program for the occasion. The dates were February 8-10. Outline of program follows: Sunday, February 8, members of the commission visit the Tilden home in New Lebanon, N. Y. and place floral emblem on tomb, after which ceremonies in the Congregational church, with addresses by commissioners. On Monday, the date of Tilden's birth, joint session of the two branches of the legislature, presided over by Gov. Glynn, concluding ceremonies at Carnegie hall, New York city, on Tuesday evening with addresses by Herman Ridder, Gov. Baldwin of Connecticut and others. Unveiling a full length portrait of Samuel J. Tilden painted for the occasion by Franklin Barber Clark.

THE WHOLE THING.—That is what Thos. H. Bussey of Wyoming was when the senate convened on Jan. 30. He was the only senator present, consequently he presided, was majority and minority leader and the whole house. In calling himself to order he said: "It gives me infinite pleasure to see so many of the members of the senate present on this, the last legislative day of the week. It is an indication of their appreciation of the great honors which have been thrust upon them and an indication of their desire to uphold the honor and dignity of the Empire State." After the clerk had read the minutes, the lone senator moved their approval and carried the motion. He then recognized himself and introduced five bills affecting the New York city police department, referred them to committees, moved the senate "do now adjourn," carried it and walked out.

BULLETIN 54.—Again we call attention to a valuable bulletin just issued by the Department of Agriculture for the farmers of the State. It relates to the dairy industry and has nearly 400 pages, many illustrations. It treats of every phase of the industry in 34 articles written by men competent to speak on the subjects assigned them. It was compiled by Edw. Van Alstyne, Superintendent of Farmers' Institutes. Another bulletin which every farmer should possess is No. 51, relating to the duties of the Commissioner of Agriculture. In it we also learn that the agents of the department made, during the last three months of last year, inspections at 830 different places, and separate inspections as follows: Food, 10,735; milk, 11,978; veal, 3,188; sanitary, 772; feed, 1,624; oleo, 4,825; stables 427, and many others making a total of 34,317.

DAIRYMEN'S LEAGUE.—Secretary Manning of the Dairymen's League says it now has 10,200 stockholders representing 158,000 cows, in 300 local branches. John Y. Gerow is president.

EASTERN MEETING OF FRUIT GROWERS.—The annual meeting of the State Fruit Growers' Association will be held in Poughkeepsie on Feb. 19 and 20. There is a good list of speakers and many practical questions are on the program for discussion. One half day will be devoted to dscussions of blackberries, raspberries, currants, strawberries, etc. There will be a banquet on Thursday evening. The State Experiment Station will have a fine exhibit of apples grown at the station, many of them new varieties originated there. The College of Agriculture at Ithaca will have an interesting educational exhibit. Horticultural apparatus will also be shown.

TEACHERS' RETIREMENT FUND.—A bill has been introduced in the Assembly which requires that all cities and school districts of the State shall contribute to the fund for the teachers who are on the retired list. These districts shall pay an amount equal to the payments made by the teachers in the city or district. Under the present law the teachers have to pay one per cent of their annual salaries. This, it appears, is not adequate for the maintenance of the fund. It is the judgment of the Education Department that the teachers should not be required to increase their assessments.

HYDRO-ELECTRIC BILLS.—The Conservation Commission has prepared and had introduced in the Legislature, three hydro-electric bills, the first of a series the Commission is preparing for the development of hydro-electric power in the State. The first of these bills is a redraft of the Bayne bill of 1912 and its purpose is to conserve the natural resources of the State and institute a policy of progressive development of electrical energy from water power under State ownership, control and supervision. It is believed that this plan will bring large revenues to the State and harness these great hydraulic resources for the public use and benefit. The so-called Capital District bill has been redrafted and applies only to the utilization of surplus canal waters for hydraulic power. The bill carries an appropriation of $650,000 of which $282,000 is to be made available in 1914. The other bill authorizes the commission to construct a hydraulic-electric plant at any point along the canal the commission may select. For this purpose an appropriation of $700,000 is proposed of which $300,000 is to be made available this year. J. W. D.

"DEATH, TAXES AND The Mapes Manures Are the Only Three Things in This World I Am Sure of"

WROTE AN OLD CUSTOMER OF OURS

Passing by the first two, he and every other farmer certainly has every right to be sure of THE MAPES MANURES. They have been used for fifty years by the most intelligent, the solidest and most successful farmers, who have banked absolutely on

I. THE RECORD OF MAPES IN THE FIELD.

Our record in the field for the past fifty years is too well-known to require more than a mere reference. In this connection, "lest we forget," in the American Agriculturist's Prize Contest, open to the entire United States, the largest crops of Potatoes and Corn grown on commercial fertilizer alone were grown with Mapes; 669 bushels of Potatoes on one measured acre with the Mapes Potato Manure, and 213 bushels Shelled Corn on one measured acre with the Mapes Corn Manure.

II. THE MAPES RECORD WITH THE EXPERIMENT STATIONS.

We are equally proud of our record with the Stations. There may at times have been an occasional chance analysis which was not quite what we would have liked, and not fairly representative of our goods, but on the grand average, year in and year out, our record has been something to be justly proud of.

III. SAME FAMILY MANAGEMENT FOR THREE GENERATIONS.

Not only have the Mapeses continued successively in the business for three generations—grandfather, father and son—but the Lanes, who have been associated with the Mapeses from the start, follow the same identical record in the business, grandfather, father and son, successively. Could there be a better guarantee than this family management, with the element of family pride deeply involved, that everything has been done and will continue to be done to make the Mapes Manures as good as the knowledge of fertilizer science permits for the crops for which they are intended.

The Mapes Manures have never stood still but have been constantly improving as the knowledge of scientific plant feeding broadened and progressed.

"The Mapes business had its inception in the scientific research and experiments of Professor James Jay Mapes, and scientific research and experiment, coupled with the most exact practical experience, have been the dominating factors in the Mapes business to the present day."—The Florida Grower.

Weedy Land for Potatoes.

I have an acre of ground, formerly producing good crops, but now covered with plantain and sorrel, which I am thinking of putting into potatoes this Spring. Is it advisable to do so and if so, what would be the best preparation of the ground for them? If not, what other crop would you suggest which could be kept under cultivation? E. S.

Honesdale, Pa.

It is doubtful if this piece of land will produce a successful potato crop. We should prefer to plant corn in hills the first year, and give thorough cultivation, so as to kill out as much of this foul growth as possible. We should plow early, and then if possible use a disk harrow to chop up the sod thoroughly. Then mark both ways and plant corn, using about 300 pounds of a corn fertilizer in the hill. Give the most careful cultivation, and hand hoeing, and at the last cultivation sow rye and Crimson clover in the corn. Another year by carrying out this plan the ground will be in much better shape for potato culture.

Cover Crop in Corn.

I wish to sow something between the corn at last cultivation which will make a rank growth to turn under in the Fall for green manure, and then seed to Timothy and Red clover. I had thought of cow peas and Cow-horn turnips. Would Dwarf Essex rape be of value? Would such crops have a tendency to lessen the corn crop? What could I sow on rye stubble to turn under in September and then seed down to grass? M. H.

Simsbury, Conn.

For such a crop as you require, you should sow in the corn at the last cultivation, three pecks of either cow peas or field beans, and in addition, one pound of Cow-horn turnip seed, and two pounds of Essex rape. All these crops will make a fair growth in the shape of corn. This can be plowed under in late September or early October, ready for grass seeding. You should use a dressing of lime when sowing the grass seed. The field beans will not give you as rank a growth of vine as the cow peas, but they are a surer crop. In a dry season, this cover crop will interfere somewhat with the corn, by taking moisture which belongs to the corn crop. With plenty of rainfall there will be moisture enough for both crops. For the rye stubble you should plow under after harvest and seed to each acre, six pecks of buckwheat and 12 pounds of Crimson clover. This will make a fair growth before late September, and add considerably more than the cost of seed and labor to the soil.

Earthworms in Well.

Do you think earth or angle-worms would contaminate the water in a well if, as in time of a drought, the worms fell into the water? If so, what would you recommend to prevent such an occurrence? I have sprinkled the earth in the carriage road with salted water to destroy weeds, and it has brought the worms to the surface in myriads. There are chemicals used on lawn and golf links that produce like results and kill the worms. Would these dead worms be dangerous in the water or to to poultry? There must be conditions of the earth favorable or vice versa to these worms, as you will probably have noticed when digging bait for fishing, when you could get a cupful of worms without changing your position, and then again, you might dig over an acre and not get a worm.

Litchfield, Conn. F.

While not an authority on earthworms, I can see no reason for considering their presence in wells deleterious unless they occur in such numbers as to cause appreciable pollution of the water through decay of their bodies. The food of earthworms is vegetable matter mixed with a certain amount of earth, which they swallow while burrowing their way through the soil. It is their habit to come to the surface at night to feed and discharge their excreta, but the flooding of their burrows with water will cause them to emerge at any time, and if this water has been charged with substances poisonous to them, they would naturally die at the surface. It would not seem probable that they would absorb enough of this poisonous material to render them injurious to chickens in the small numbers which would be eaten. The upper two or three feet of well curbing could easily be rendered imprevious to earthwarms by digging a narrow trench about it and filling that trench with cement grout, or by plastering the inner surface with the same material. M. B. D.

Scraping Bark Off Fruit Trees.

When is the best time to scrape the old bark off apple and pear trees? The trees are old but have borne fruit this last year, only it was small and knotty.

Robbinsville, N. J.

You can scrape the bark now or anytime before Spring. Scraping off and burning of this rough coating will destroy many eggs of insects which are buried under these rough scales. A good wash with a lime-sulphur mixture after scraping will help.

Cement Wall.

I wish to build a barn 30x35 feet, wish to put a cement wall about three feet deep and 10 inches wide. How much cement and gravel will it take to build this, and what proportion of cement?

Warren, O. W. E. S.

A foundation wall of the dimensions you give would contain 317½ cubic feet, and if built of cement, sand, and gravel, in the proportions of one part cement to 2½ parts of sand and five parts of gravel, it would require 15½ barrels of cement, 5½ cubic yards of sand, and 11 cubic yards of gravel. An ordinary team load of sand or gravel contains 1½ cubic yards. The gravel from some banks contains sufficient sand to make the natural mixture as it comes from the bank suitable for use in walls. Small rough stones bedded in the wall as the concrete is put into place in the forms save concrete. Do not let such stones rest against the forms where they will be exposed to view when the forms are removed. M. B. D.

Cement Slab.

Will you give directions for making a slab composed of cement, sand and marble dust? We have these things, and want to make a slab for the kitchen sink.

Torrington, Conn. C. E. R.

For such a slab make a wooden frame, or form, of the desired size and as high as the slab is to be thick. Place this upon a smooth surface where it can remain until the concrete has thoroughly set, and within it place a second form of the size of the space that the iron sink is to occupy. Fill the space between these two forms to about half its depth with a concrete mixture composed of one part cement to two parts of clean, sharp, sand. Upon this layer of concrete place the reinforcing wire mesh. This may be the heavy half-inch mesh wire netting, such as is used to protect cellar windows. Having covered the surface with this wire netting, continue the filling of the form with a mixture of Kean cement and marble dust, about half and half. If it is desired that the exposed edges of the slab shall have the marble finish, plaster the inside surface of the form with the marble-cement mixture before putting the sand-cement foundation in place. Make both mixtures of about the consistency of heavy mortar. The surface of the slab may be troweled smooth, and later, may be polished if desired. Wet the wooden forms thoroughly before filling. Make the slab under cover where neither wind nor sun can strike it so that it will set slowly. If to be supported upon brackets, you will probably want the slab about two inches thick; if it is to be thicker than this, fill the form to within about one inch of the top with the foundation mixture of cement and sand, and it might be well to embed more than one layer of reinforcing mesh. M. B. D.

"Mrs. Brown has the kleptomania." "Indeed; what is she taking for it?" "Anything that looks good to her."—New York Times.

Goodrich Unit Molding was the original Safety First tire idea

The quality of Goodrich Tires today is the standard by which all high grade tires must be judged. This is because they represent the perfection of tire-making and tire-knowledge—which gives Goodrich Tires their leadership.

Every layer of the finest fabric, the livest, best rubber—the whole tire—tread, side strips, bead and all—becomes one piece in Goodrich Unit Molding—the original Safety First idea in tire building.

All this backs up the Goodrich Safety Tread—the group of bars and the crosstie that form the Safety First symbol for the motorist.

Goodrich Safety Tread Tires

Best in the Long Run

Here are the lowered prices on Goodrich Safety Treads that make them the best quality tire values motorists ever received. Your dealer can supply you:

Size	Smooth Tread Prices	Safety Tread Prices	Size	Smooth Tread Prices	Safety Tread Prices
30x3	$11.70	$12.65	34x4½	$33.00	$35.00
30x3½	15.75	17.00	35x4½	34.00	36.05
32x3½	16.75	18.10	36x4½	35.00	37.10

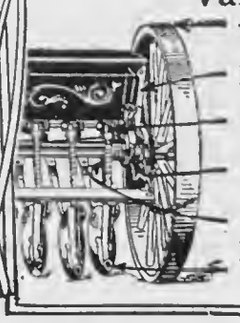
Bigger Crops-Better Grain-Less Seed

VAN BRUNT DRILLS

Famous for accurate feed, correct covering, light draft, light weight and durability.

These features made Van Brunt famous



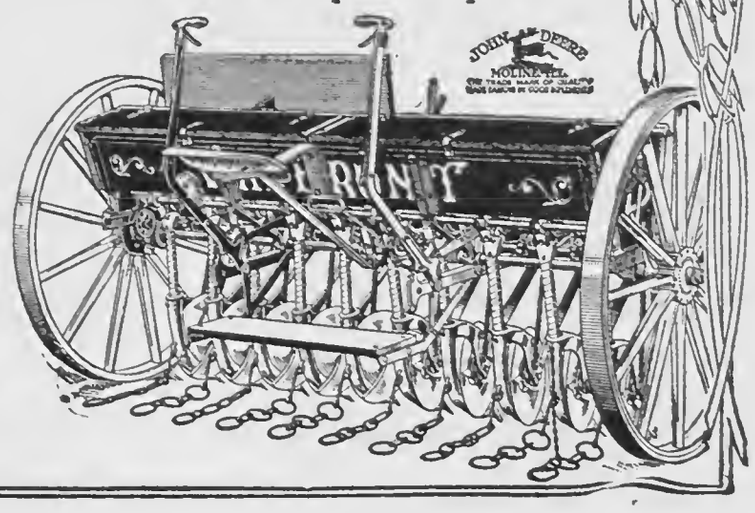
- Wheels always stand true.
- Hopper trussed—don't sag.
- Adjustable gate force feed.
- Bearings extend under frame.
- Adjustable spring pressure.
- Every seed at bottom of furrow.

Every grain grower should investigate the new and improved features of Van Brunt drills. The adjustable gate force feed, the successful fertilizer feed, the non-chokeable disc openers, the trussed hoppers, the light weight, the light draft,—all of these features combine to make the Van Brunt famous wherever introduced. Don't seed another crop with a poor drill.

Book Free

Every grain grower should have our new drill book. The improved features of Van Brunt drills make them most desirable. Write and ask for package No. VB 33

JOHN DEERE
MOLINE, ILLINOIS



AN INEXPENSIVE GREENHOUSE.

Part I.

Advantages of Greenhouse.—Do you have a few sash under which you grow vegetable plants for Spring sales, or possibly a few early vegetables for the home table? Did it ever occur to you while digging a trench a few feet deep to accommodate manure, or afterwards while wading through mud to ventilate, make and care for same, or repairing sash blown round by a sudden gust of wind, that it would be much more pleasant to work inside or under the sash on the outside?

Building With Sash.—Anyone having to 6 to 12 or more sash can easily and cheaply convert them into a small, though satisfactory greenhouse in which a much larger variety of plants can be grown, and grown in a better and more sturdy manner, as conditions are more under control of the operator and the work can be done at odd times when the other work is not pressing. With the hotbed you must work when the weather permits, and there are some seasons that have a few suitable days for sitting above a hotbed to transplant plants, etc. The greenhouse has one drawback, though. When the hotbed is covered with rye-straw mats, or shutters, it is usually safe for the night. The greenhouse on the other hand, must have a good heating arrangement, so that attention to same is not too binding, and of sufficient size to carry fairly uniform heat seven to eight hours without attention. Even considering this feature as an objection, I feel sure that after a few weeks' experience with heating, watering and ventilating the greenhouse, you would not of your own volition go back to the very much limited hotbed, especially when the wide range of utility of the former over the latter is considered. In using sash for greenhouse constructive purposes we set good-sized posts in the ground five feet four inches, centers of height wished, and nail rough hemlock boards inside of posts.

Frame Used.—Having a lot of sash, and becoming tired of the continuous and unpleasant attention they required, and their limitations as to usefulness, we constructed a house 10½ feet wide by 160 feet long of them. We find this much more practical, economical, and easily managed. Our conditions though, are different from the average small property owner with a small hotbed, as we had steam heat available, and run one two-inch flow pipe to far end and returned with five 1¼-inch returns. This gives us all the heat required for crops growing in carnation temperature, such as lettuce, radish, most vegetable plants, etc. Our posts are about two feet above ground level, and two hemlock boards are nailed inside, and earth banked up on outside near top edge. This allows sash supports placed directly in notches cut in top edge of board between each, as under each sash joint, and earth being banked up on outside holds entire weight of roof without spreading, and without posts inside. Under ridge we dug out a walk of sufficient depth to allow comfortable head room.

Ventilation.—We also had a lot of old ventilation sash 24 inches wide that had been used along ridge of a greenhouse, which we used for ventilation at top of this house. If you wish to transform a lot of sash into a sash house and do not care to purchase narrow sash (even a 12-inch opening would do) to place at top for ventilation, the house would then be about eight to 8½ feet wide, and every third or fourth sash would have to be hinged at bottom so as to allow raising at top to ventilate. At top edge in each side inside we nailed an ordinary roofing lath 1x2½ inch; on south side, for rafters every six feet we used a 2x4, and used two pieces 2x4 for ridge, one nailed flat on top of other. The top piece has a rabbet on each edge, under side, which allowed top of sash to project ¾-inch under same. It does not matter how hard it rains or blows, no water can enter at that point.

The sash in each side are hinged to this ridge cap. The rafters on north side are 1x3-inch under each sash joint. The narrow ventilation sashes close down on sash rest about two inches from top, and lower 3x6 sash are hinged to this leader. This arrangement allows a sash anywhere to be raised at lower edge, on warm days for additional ventilation, or removing plants, or renewing soil.

Heating.—Now I have said this house is satisfactory *but I do not wish it to appear that I advocate the purchase of sash with the construction of such a house in view.* The construction of a small house from new material will be treated separately. Next and more important than the construction is the heating of this small sash house. If in size it is less than 10x20 feet it can be heated safely and very satisfactory by a good-sized cheap stove. Dig out a pit several feet deep in north side of walk near center or a few feet farther toward end from which your cold prevailing winds blow. If house is built north and south put heater at north end. Around this stove place a piece of sheet iron without openings except a foot or more at bottom, and allowing it to extend well up toward roof top of stove. Allow 10 to 12 inches clear inside round stove. You will find this will make a remarkable difference in causing an air circulation, over the exposed stove in house. When heated you can test this circulation by burning tobacco stems, or making any other smoke over stove. You will find it go to far end of house and back at lowest point to base of stove in a short time. This shield also protects nearby plants from direct drying heat of stove, which is deleterious to healthy plant growth. As an additional help the above pipe can run from wherever stove is placed to far end of house overhead, or under bench if benches are used and stove is placed low enough. In a house 30 to 40 feet long a stove could be placed at, or near each end, preferably in the house, so all the heat would be available. Beyond these limits a hot-water system would be more desirable and reliable, and will be discussed later.

Preparing For Radishes.—A house of above description will lend itself to many uses and a wide variety of crops can be grown, especially plants, radishes, lettuce, and as a fallow crop, tomatoes. If your location is near a small town you could grow radishes and Grand Rapids lettuce, and in a very short time build up an excellent trade for same. Icicle is possibly the best white forcing radish and Cardinal Globe the best scarlet. Icicle should be sown in rows four to five inches apart and thinned to 1½ inch in rows. Cardinal Globe can be sown three inch rows and thinned 1½ inch. The latter matures earlier than Icicle, but in our market does not sell as well. Radishes require a very rich soil, one-fourth manure, and a high-grade fertilizer at rate of nearly one ton per acre is not too much of an application for this crop. The manure should be well rotted and thoroughly incorporated with the soil in preparation for seed. The fertilizer can be applied when plants are an inch or two high, and watered or cultivated in. A mixture of 100 pounds nitrate of soda, 300 pounds dissolved bone and 100 pounds sulphate of potash gives a good quick-acting manure. Water should be used freely as radish is nearly all water, chemically, and when beds are kept saturated toward finish of crop maturity is very rapid. A crop should mature in about six weeks; 48 deg. at night and 65 deg. on bright days is about right for temperature; 55 deg. is proper for cloudy days.

The Lettuce Crop.—Grand Rapids lettuce should be given same soil and temperature, but not quite as much water, and should be planted 6x8 to 8x8 inches each way. In growing lettuce it is necessary to have good strong plants ready to plant in beds as soon as a crop is off, as no time should be wasted after plants are set in beds. Great care must be exercised to keep lettuce clear of green fly or aphis. Many growers mulch heavily with fresh tobacco stems between plants for each crop, or use tobacco stems to fumigate. This can be done in an old galvanized iron bucket with large holes punched in bottom for draft, or by burning paper in walls and placing a pile of wet stems on same. Care must be taken not to make application too strong. A safer way would be to purchase some tobacco solution from your seedsman and spray according to directions.

To Maple Sugar Makers

One of the most successful of twenty-one Vermont Maple Sugar Makers' Conventions has been put on record, and with it, the Grimm Utensils were placed at the head of the list.

THE HIGHEST SCORE on Maple Syrup was 99 points, and the highest Score on Sugar, 98 1-2 points, and all were **Made with the GRIMM Apparatus**

This little pleasantry has been going on for twenty-one consecutive years. It is conceded by those who know that if all the Maple Syrup and Sugar produced in the United States were made with Grimm Utensils, the extra quality would **increase its value over $2,000,000,00** annually, and the saving in time and fuel would be an additional large item.

"ASK FOR CATALOG E"

Assuming that Grimm Sap Spouts were exclusively used for tapping next season, the increased production of sugar would amount to 25,000,000 pounds, one-fourth of the approximate total of 100,000,000 pounds. At a low estimate of 10c per lb., there would be a **net gain of $2,500,000.00.** This being a fact, can we afford to cling to the old methods, considering, too, that there is an unlimited demand for a pure maple product, and that no other farm crop pays a better dividend? Valuable information and **Sample Spout Free.**

HUBBARD'S BONE BASE CONNECTICUT FERTILIZERS

1914 Crops

Every progressive farmer is planning *NOW* for this year's crops. No individual or farm can *stand still.* Your Farm will go *Forward,* and the lands become more and more productive—or they will deteriorate and produce less bountiful and less profitable crops. *Which will it be in YOUR case?*

Make This a FORWARD Year

Use Hubbard's BONE BASE Fertilizers

They are the result of *Scientific Research,* and contain a Maximum amount of *Plant Food* per dollar invested. Let us co-operate with you, to the end that the *Science of Fertilizers* may be applied to the *Business of Farming.*

Write today for our booklets **"Soil Fertility," "The Grass Crop," "The Apple"** and **Hubbard's Bone Base 1914 Almanac,** which contains much valuable information about soil, fertilizers and other farm subjects. Sent free to any address.

Walnut Timber.

I have two walnut trees on my place measuring 18 feet before they branch. They measure 16 and 21 inches thick. I wrote to a mill near here asking what they paid for timber. They write saying they are paying $25 per 1,000 feet for logs of this sort. This would bring the price of each tree very low—it would almost be better to utilize it for firewood. But when I price walnut furniture I find it very costly and there is said to be an extreme scarcity of this wood. I am told the smallest pieces are utilized for veneering, etc. Is not the price quoted me entirely too low, and what would be a fair price? M. S.

Johnsville, Pa.

There is no standard price for such small lots of timber. In our own case we have been obliged to take what the buyers offer. Where you have a lot large enough to invite competition you can say something about the price, but with only a few trees the buyer has all the advantage. We have been all through this. Of course good Black walnut is worth more than $25, but you will have no way of dictating the price if you have only two trees.

Market for Maple Syrup.

I have a lot of maple trees on the farm, and before I waste my labor in tapping them, I would like to know if there is anybody who buys raw maple syrup and what is the market price per gallon? B. C.

New York.

If you don't find a ready market for good maple syrup in your neighborhood, there is something wrong with the people. It has sold readily in my section, for as many years as I can remember, at from $1 to $1.25 per gallon; standard legal weight of 11 pounds to the gallon. There is always a market for it in the cities, though what is done with it there is a mystery. I have frequently found it upon the bill of fare at good restaurants, but never on the table. Pure maple syrup is a luxury always in demand, and most farmers are able to dispose of all that they can make, selling directly to the consumer, and getting all of the dollar. If you can make the syrup, don't worry about the market. M. B. D.

Fertilizer Value of Coal Ashes.

Tell me what value, if any, coal ashes have mixed with nitrate of soda or potash, as a top-dressing for meadows? E. J. P.

There is no plant food value in coal ashes. Unlike wood ashes, they do not contain profitable quantities of lime, potash, or phosphoric acid. They have a value as absorbents, and for helping the mechanical condition of the soil. They make what is called a carrier of plant food. Sifted coal ashes can be used for distributing nitrate of soda and potash. Probably the best way to use them would be to dissolve the nitrate and potash and sprinkle the solution over a good sized pile of sifted coal ashes. Mix this solution thoroughly through the ashes. Then let it dry, and broadcast as you would any other fertilizer. As the pile dries, the water evaporates, and leaves the plant food in the nitrate and potash thoroughly distributed all through the ashes. Then if these are kept dry they make a good application for handling the plant food.

Pruning Apples in Idaho.

At what age can one expect an apple tree to bear, and how should a tree be pruned to bring it into bearing as early as possible? Should the new growth be cut back each year, or after, say the third year, would you simply thin out the branches and let the main limbs grow? I have in mind Jonathan and Rome Beauty. J. W. A.

Boise, Idaho.

1. Apple trees and all other kinds of fruit trees bear very early in Idaho, and all of the Western regions. It is very seldom that an apple tree there fails to produce some fruit at four years from planting and I have seen many at that age holding about a bushel of apples, or even more. While this is too early in the life of a tree to produce such heavy crops without some injury or the retarding of their normal growth it brings quick returns. There is a general tendency to precocity rather than tardiness in bearing in all of the Western country. Jonathan and Rome Beauty are not as early bearers as some few other varieties, but they usually bear soon enough. The trees are not likely to need any special pruning to bring them into bearing. If they are well shaped while in the first three or four years of their growth they will not need much more pruning for several years. It is not well to thin out the branches severely, for as they begin to bear loads of fruit they will be spread by its weight and the tops thus be made more open than might be thought at first. There should be no severe cutting back of the tops while the trees are very young, for the more this is done the more nature will try to replace the parts cut away and bushy tops are apt to result. Be moderate with the pruning tools and use plenty of common sense rather than to follow set notions about the supposed great need of a lot of pruning. H. E. VAN DEMAN.

Pickles on Sour Soil.

I have four acres of loam land; cut a small crop of hay last season. In the early Fall I plowed it, harrowed once. Immediately the sorrel started to grow and in about a month the field looked like a spinach patch from a distance. My intention is to spread this field with manure and plant to pickles about June 1. Do you think the conditions that cause this growth of sorrel will be injurious to the pickle crop, and if so can you suggest a remedy? R. F. S.

Deer Park, N. Y.

The sorrel indicates a sour soil. The pickles will not do their best in such a soil, but will be much better if you use lime. The usual remedy for land badly run to sorrel is to plow it and harrow in a ton of air-slaked lime to the acre. This will fit that soil better for the pickles.

WELLS IN FLORIDA.—The State Geological Survey of Florida has begun a very good thing in calling for records of drilled wells in that State. Many wells are being drilled, some of them to considerable depth, and the geologists asked the well drillers to keep accurate accounts of the depth of the well, and the character of the under soil through which the well goes. Thus this is the best way of learning about the underside of Florida soil, and such data would be of great importance in the conservation of water. This is a good thing for all well drillers to work out. We shall come to a time when the under soil, for the water there may be in it, will be almost as important as the surface soil.

TOMMY (explaining his late arrival at Sunday-school): "I wanted to go fishin', but father wouldn't let me." The Minister: "I'm delighted to hear you have a parent with such excellent principles regarding the Sabbath. Did your father explain his reasons?" Tommy: "Yessir. 'E said there wasn't enough bait for two."—London Sketch.

MRS. BRIGGS: "So there's not going to be a postal strike after all, Mrs. Johnson?" Mrs. Johnson (remembering the coal strike): "Well, you never can tell but what it may come at any moment; so I shall lay in a good stock of stamps now."—Punch.

An inquisitive young gentleman read this advertisement in a local paper—"Young man, some woman dearly loves you. Would you know who she is? Send postal order for ten shillings to Occult Diviner, address as below, and learn who she is." He sent the money and received this answer—"Your mother!"—Credit Lost.

"I'll Pay $1.00 for Every Knot"

That's My 1914 Challenge To Every Man Who Buys or Sells Lumber

"I'll pay $1.00 per knot for every knot any customer can find in our Red Cedar Siding shipped from Bay City. I stand ready to prove to you in this way that the lumber in Aladdin houses is higher grade throughout than is regularly carried by any seller of lumber in America. Clear Siding, Clear Flooring, Clear Interior Finish and Clear Shingles are furnished for every Aladdin dwelling house." O. E. SOVEREIGN, *Gen. Mgr.*

ALADDIN Quality Excels

Shrewd buyers quickly understand the great advantage of the Aladdin System. It cuts out the waste. You pay for only the lumber that goes into the house—not what goes into the waste pile. The lumber that's wasted costs just as much as the lumber that's used. The Aladdin system saves $18.00 on every $100.00 in material waste alone. Then, too, the price of lumber is 30% less than the average dealer's price. The Aladdin Readi-Cut System of construction—all lumber cut to fit—saves proportionately on labor. These facts make the below price possible—five room house complete $298.00.

Clear Siding—Clear Flooring—Clear Finish

We positively go on record and guarantee that the material in Aladdin houses, framing, siding, flooring, finish, doors, millwork, paints and hardware, are all of higher grade than any other manufacture of houses in America—we stand ready to prove it. And it's far better than the average grades carried by any lumber dealers anywhere.

Cut Out the Middlemen and Builder's Profits

The timber for Aladdin houses is cut from the logs, piled, dried and manufactured under one roof and shipped direct to you. No other manufacturer in America completes all these operations in one plant. No middlemen between the timber and the finished complete house when you own an Aladdin house. The Aladdin catalog tells the story.

Save $200.00 to $900.00 On Your House

Consider carefully the completeness of the following list of material which is furnished with each Aladdin house. All framing lumber cut to fit; siding cut to fit; sheathing cut to fit; flooring cut to fit; all inside and outside finish cut to fit; windows, frames, casings, stairways, glass, hardware, locks, nails, paint and varnish for the outside and inside, shingles, plasterboard for all the rooms, or lath and plaster, complete instructions and illustrations for erection, eliminating the necessity of skilled labor—a complete house.

Aladdin construction passes successfully the strictest regulations of the big cities. This means they are built according to the most approved building laws. Send today for catalog.

Your Best Working Partners Are a Pair of Helpful

Hansen's Gloves

This "Glad Hand" Gauntlet is a fine example of how Hansen's Gloves are built to share your work and make it easy and fast.

Their perfect protection proves that rough work does *not* mean rough hands. It is also the truest economy—a saving in time, labor and *hand-health*. Price, $1.25 up.

The 500 styles include the right glove for driving, motoring, cycling and all sports. For lighter chores, heavy work, threshing, lumbering, etc.

Book Free

Specially tanned leather, cannot shrink or shrivel, harden, stiffen or peel. Easily cleaned in gasoline. Gloves for the boys, too. If your dealer is not a Hansen man, write us for book and full information.

O. C. Hansen Mfg. Co.
136 Detroit St., Milwaukee, Wis.

RIEMER'S
WOOD SOLE
Shoes or Boots

PATENTED

Just the thing for farmers! Light, durable, sanitary, waterproof—way ahead of leather or metal soles for all farm and dairy work. Try a pair and be convinced. Send money and state size wanted. SHOES, $2.50 BOOTS, $2.75, Delivered by Parcel Post, free, direct to your door. Satisfaction or money back.

FREE! For a limited time we will give absolutely free a can of Riemer's "Shoe Life" with every pair of our wood sole shoes or boots. It's a perfect dressing for work shoes, boots or harness.

Illustrated booklet free.

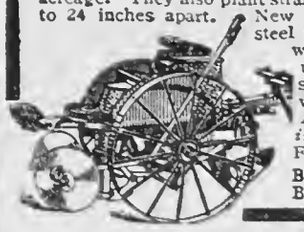
A. H. RIEMER SHOE CO. (Established 1887)
2911 Vliet St., MILWAUKEE, Wis.

Potato Profits

depend largely on how the crop is planted. Every skipped hill is a loss in time, fertilizer and soil. Every double wastes valuable seed. It means $5 to $50 per acre extra profit if all hills are planted, one piece in each. That is why

IRON AGE 100 Per Cent Planters

often pay for themselves in one season on small acreage. They also plant straight, at right depth, 12 to 24 inches apart. New angle steel frame and steel seed hopper. With or without fertilizer distributor. Ask your dealer to show you this Planter and write us for booklet, "*100 Per Cent Potato Planting*" and copy of Iron Age Farm and Garden News.



BATEMAN M'F'G CO.

The Rural New-Yorker, 333 W. 30th St., N. Y. City.

Injured Maple.

We have a nice maple tree in front of our house about 19 inches at butt. It is cracked or checked from base to first limb, which is about 12 feet and on the opposite side from top of trunk down nearly to bottom. Will you let us know what we can do to save tree, and what is the cause? A. S.
Oswego, N. Y.

It is not always possible to tell the exact cause of such injuries, but it is extremely probable that in this case it was caused by hard freezing and sudden thawing of the wood. Maples and other sap-producing trees are often injured in this manner, especially in latter part of Winter. I have seen good-sized trees split to the heart from this cause, and remember in my boyhood in the mountains of Western Pennsylvania when the Winter used to be of long duration and continuously severe, from November to March, that when a sudden warm spell came on while the trunks of the forest trees were full of frost, the sudden thawing would cause many of them to split with a report that often could be heard for a half mile. If the bark is dead near the edges of the cracks, it should be removed back to the live bark, cutting away every sign of decay, and all decayed wood, if any, should also be removed with a gouge and mallet, and all cavities filled to prevent the entering of moisture and insects. A three to one sand cement is mostly used for this purpose, but I prefer the following: Take coal tar and thoroughly mix with it by stirring about three or four times its weight of powdered slate, known as slate flour. This mixture is also known as plastic slate, and is used for roofing purposes. It is easily applied with a small trowel, and though it hardens on the surface it will remain soft and elastic underneath. The heat of the sun will not melt it. Nor do the coldest days of Winter cause it to crack, neither does it peel off. After the cavities have been neatly filled with the plastic slate, paint over with coal tar or asphalt all the surface from which the bark has been removed. K.

Is the Manure Sour?

My hog pen is on a slope; in the lower corner I scraped out a small reservoir two years ago. It has washed full of manure and decaying corn cobs, but is very sour. I wish to use the manure. THE R. N.-Y.'s theory would be to pile with lime or ashes and let rot awhile. Would it not be just as well to spread on ground and then spread ashes or lime on top of manure before plowing?
Jonesboro, Ark. E. W. C.

Are you sure this manure is sour? We should be inclined to doubt it without a test. We should get little strips of blue litmus paper, take fair samples of this decayed manure, and put the litmus paper down into it. If it turned red or pink it is sour, and needs lime. We believe, however, that this is not as sour as you think. Your plan of hauling the manure, spreading on top of the ground, and then putting lime or wood ashes over, it before plowing, is not a wise one. If you do this the lime or ashes will cause more or less of the ammonia to be set free in the form of gas, and on top of the ground this will be lost. If, however, you spread the manure, and plow it under, then spread the ashes or lime and harrow in, you will have the effect of breaking up the organic matter under ground. The ammonia thus set free will be held in the soil and not lost.

Growing Budding Stocks.

Tell us how to grow budding or grafting stocks of fruit trees from the seeds.
J. L.

Apple, pear and quince are grown from stratified seeds sown in early Spring. Seeds of these fruits should be placed in flat boxes about four inches deep, with an equal bulk of fine soil or sand well mixed together as soon as ripe, or gathered, and the boxes buried in the ground 12 to 18 inches deep, where drainage is good, to preserve moisture. The boxes are to remain so buried until Spring, when the seed must be sown in the seed bed as early as possible, in rows 12 inches apart, and about one inch apart in the row. Good cultivation should be given the young seedlings from the start. The following Spring the seedlings are lifted, graded, and planted in nursery rows 3½ or four feet apart, and six to eight inches apart in the row, each grade being planted together. Give good clean cultivation and quite all will be large enough to bud by latter part of July or first week in August.

Stone fruits, the seeds of peach and plum, should be buried in bulk in the ground where drainage is good, in the Fall. Mix soil through them to maintain even moisture, cover six or eight inches deep. The following Spring, as soon as the seeds begin to sprout, dig them out and plant in nursery rows 3½ feet apart, and four to six inches apart in the row. After the young seedlings attain a height of three or four inches cultivation should begin and be maintained until the budding season comes on, when cultivation may be discontinued for the season, but keep all strong growing weeds pulled out at all times. Budding may begin in July and be continued until September if necessary. Any seed the frost and moisture failed to open, may be carefully cracked with a hammer and planted with the sprouted ones in the nursery row. K.

Soil for Baldwin Apple.

Does the Baldwin apple do well on heavy soil? S. D.
Oak Hill, N. Y.

By nature the Baldwin does best on the lighter type of soils. On the heavier soils it makes too much wood growth, matures later and usually gives a lighter colored fruit.

Lime on Alfalfa.

I have one acre of Alfalfa, which looks well. Would it be good if I put some lime over it now, with well-rotted manure? F. K.

You would not obtain full value of the lime by spreading it on top of the Alfalfa. Lime ought to be worked into the soil at seeding time. This lime would help somewhat, but this is not the best way to use it.

Oats on Millet Sod.

The middle of July I turned over one acre of Timothy sod, which had been seeded three years. I fitted well and put on 600 pounds of fertilizer sown broadcast, seeded it to millet, but owing to the drought did not get millet over three inches high at frost. Could I, next Spring, sow this piece to oats for fodder without any more fertilizing? Soil is light sandy loam. B. P. H.

Yes. This soil should now be strong enough to produce a good crop of fodder. We should seed Canada field peas with the oats for fodder. This combination will make stronger feed and more of it than oats alone.

WORN-OUT BATTERY.—On page 107 I. A. B. asks, "Will you tell me what is used and in what proportions in a dry battery to make it react?" Whenever I had a worn-out dry battery, I dug the filling out, about half way down and filled it up with common table salt, and then poured enough water on to cover the salt. In this way the battery will last just as long again. When the water evaporates put more on. Keep the salt covered with water. H. V.
Hillsdale, N. J.

THE PROFESSOR'S WIFE (to the professor, who has just come in from a walk): "What have you done with your umbrella and Fido?" The Professor (trying to remember): "What—h'm—wait a minute—oh yes, precisely. You see, my hat blew off, and I didn't want to have the poor little beast run with me after it, so I stuck the umbrella in the ground somewhere and tied Fido to it I suppose they are still there."—Credit Lost.

E. Frank Coe Fertilizers

1857 THE BUSINESS FARMERS' STANDARD FOR OVER FIFTY-FIVE YEARS 1913

Do You Raise 300 Bushels of Potatoes per Acre?

THREE hundred bushels per acre is not an unusual yield by any means, but did you get it this year?

¶If you were planning to raise 300 bushels of potatoes to the acre how far apart would you space your rows? How far apart would you drop the seed pieces in the row?

¶How much fertilizer would you use to grow 300 bushels of potatoes per acre? How would you apply it?

¶Are you sure that your seed potatoes are true to name and true to type?

¶What are you doing to prevent "scab" and early and late blight?

¶Did you have a short crop of potatoes because of dry weather? Have you decided how you will overcome this trouble in the future?

¶All these practical points, and many more, are fully covered in our new book

"Potatoes: A Money Crop"

which will be sent free to every potato grower who requests a copy, and mentions this paper.

¶This book is written by a man who himself has had years of experience as a potato grower, and who has made a careful study of the best methods of other growers.

¶If you read this book you will keep it for future reference. It is a "worth while" publication.

Farm Management.

Tools for Small Farms.

Could you start some discussion as to what implements would be necessary for a small farm, 40 to 60 acres, where one intended keeping a few cows, 200 or 300 hens, some hogs and maybe a few sheep. The object would be to have an orchard of eight or 10 acres, and most of the land in Alfalfa and clover, and to seed a cover crop every time there was a possible chance. One could not afford to have all the implements one sees recommended; a sulky plow, because one can do better and deeper work, a weeder (an implement that I think has been overlooked), a spike-tooth harrow and a disk (and while on this subject, what advantage has a cutaway over a disk?) and several others. I would hire grain cut and rent a spreader as I don't believe $200 or $225 tied up in this would be a paying investment. I know you like to get at the root of things, and I do too, but I don't see how a small farmer working three horses (one of which he might rent) can afford to be buried under the mass of implements that some of them have. I would rather do without some of them and have water in the house, steam heat, a gasoline engine and some of the conveniences that go to make life pleasant and work easier (I mean the everyday work). H. H.

Indiana.

R. N.-Y.—Let us consider the discussion started. This is a good part of farm management, for an idle tool eaten up by rust is as bad as a useless horse standing still in the stable. Let us have a full discussion of this point.

Sewage Disposal.

By Col. Waring's system for the sanitary disposal of sewage by siphonage, it is claimed that the solids liquefy and pass freely through the distributing pipes, etc. How long a period does it require to dissolve the solids and can the result be hastened by the use of chemicals? Can I add a dissolvent solid sewage to hasten the fluid character, so it would run off through drainage? A. F.

Litchfield, Conn.

If, as I presume, you refer to the system of sewage disposal by means of a septic tank, this should be large enough to hold at least 24 hours' accumulation of sewage from the house which it serves, and preferably larger. The solids in such a tank are liquefied by bacterial action, the amount of time required being variable, and dependent upon the character of the solid matter; ordinarily, several days being required. As the solids become liquefied they flow away with the fluid contents of the tank. I know of no chemical which would hasten this action, and none is needed, as the very principle upon which the tank works is based upon liquefication of the solids in sewage by bacterial action. I judge that your vault is not constructed on the true septic tank principle. M. B. D.

Equipment for Unloading Hay.

With regard to the questions on page 128 by J. F. T. I would say that having used both, I prefer the steel track to the wooden. The cost differs but little, and both work equally well, but the steel track is practically indestructible, and should any breakage occur a section is easily replaced. A reversable combination car can be obtained that will carry the hay to either mow without removing the car from the track, and which can be used with either of the different types of forks, or with the slings. It is necessary to go up to the track to place the rope through the pulley at the end of barn whenever the direction is changed, and a ladder built permanently to the end of the barn is probably the safest way to reach the track. However, I offer the following suggestion: While the mow is full place through the end pulley a light rope or sash-cord long enough for both ends to reach nearly to the floor. When the mow is empty one end of the light rope or cord can be attached to the end of the hay-fork rope, and the latter pulled over through the pulley.

The best kind of fork to use with clover hay is the grapple fork. This fork has curved tines which come together like ice tongs, and hold the hay very firmly. These tines may be of various lengths, and run from four to eight in number, the latter handling the finest material, even manure.

The sling is about the most satisfactory way of unloading hay or grain that you can imagine, as the slingful is taken up clean and dropped in the mow as it lay on the wagon, making the labor of spreading around much easier. The sling can be adjusted for any length of rack, and will handle any kind of hay or grain, loose or in bundles. It may be locked to the car at any height from the rack to the track, and taken to the mow at that height, thus lessening the distance for the horses to travel, and the height for the hay to drop; quite an item, as a slingful often weighs from 800 to 1,000 pounds. The load is usually taken off in three slingfuls, and due to the heavy weight, it is advisable use a somewhat heavier track and car with the sling than with the various forks. The sling has the disadvantage of taking a little more time in loading, and in hanging lower from the track, so that the mow cannot be filled quite so full as with the forks. However, the first is more than balanced by the speed with which the load can be taken off, and by using the combination car a fork can be substituted to put in the last load.

Last season I put in 75 tons of Alfalfa with a gasoline engine and hoisting machine, and found it very satisfactory. The hoist has two drums on the same shaft, one hauling the hay up and along the track, and the other returning the car to the stop over the wagon. The hoist can be operated from the wagon, the whole operation of unloading being done by two men. It will probably require an engine of at least six horsepower. I used a two-cycle eight-horse engine, and at the moment when the forkful was pulling loose from the load the engine had just about all it could handle.

New Jersey. I. L. O.

CLARIFYING VINEGAR.—If you have some vinegar that is muddy or off color try putting about a teaspoonful of cream of tartar to each half gallon of vinegar. S. T. W.

Trees Grow Faster in Blasted Holes

Trees planted in blasted holes averaged 1207 inches new growth the first year; trees in spade-dug holes grew only 555 inches, the New Jersey Experiment Station found. You get bearing orchards two years sooner and have bigger, thriftier, stronger-rooted trees when you plant them in holes blasted with

Atlas Farm Powder
THE SAFEST EXPLOSIVE

A small charge digs the hole and breaks up the subsoil for several feet in every direction, putting it in condition to promote rapid growth. It costs less than hand-digging, and is easy, and efficient—does its work instantly.

Atlas Farm Powder is made especially for farm purposes and is sold by dealers near you. It is safe, convenient, and most economical for you to use in planting your trees, blasting stumps and clearing land, digging ditches, etc.

Hope Farm Notes

I know two men, both close to the period of life when they may be said to live on "borrowed time." One of them is as sour as a pickle. I think this man had opportunities when he was younger, but he never seemed to grow into any of them. They tell me that he took up one thing after another, until it got a little hard and monotonous, and then dropped it and took something else. Thus when the bloom of youth had been rubbed off this man found himself only able to tinker at a few inferior jobs. He was master of nothing, because he had not dug down to fundamental principles, and could put no spirit into his work. You should hear this man complain about the condition into which life has crowded him.

The other man has, all his life, done what most of us call inferior work. Yet there is a curious thing about it. Does anyone in town want a garden spaded up, a front yard cleaned, a path dug through the snow or a cord of wood cut up, there is competition and demand for this man's services, as there would be for service from the leading lawyer or the expert doctor. For this man always does a clean, neat job, and is good-natured and accommodating. I never hear him growl about conditions. I have seen him walking about on Sunday afternoons looking with some show of pride at the work he has done in garden or yard. Ask him how he is able to be content with his humble lot, and how he can put pride and reputation into such "inferior" work, and he will tell you something like this:

"I know that I am better qualified (with my age and powers) to do this kind of work than any other. I made up my mind I would do it better than any other man in town. I have been able to do that because *I take joy in my job.*"

As I write this I glance at a book shelf on which I can see 50 volumes of Dr. Eliot's "Harvard Classies." Here we are supposed to have the wisdom of the ages—the words which should not die—sifted out through a mesh so large that only the gigantic thought would not pass through. For example, out of all the Bible Dr. Eliot has selected the Book of Job, the Book of Psalms, Ecclesiastes, the Acts, the Gospel of St. Luke and the two Epistles to the Corinthians! Yet, in all the nearly 2,000,000 words of this sifted classic wisdom I find no lesson of life truer to human nature than these seven words of the humble worker—"I take joy in my job."

There you have the whole story. The man who takes joy in his job puts spirit and love into it, and these are the unconscious things which make the job living and vital. I have seen a fisherman hauling up his nets and lobster traps—wet and tired, with torn and bleeding hands—looking off over the boiling ocean as the sun comes up out of the east with a look on his face which showed the "joy in the job"—for he was working for home and family. I have seen the same look on the face of a farmer who stopped the plow for a moment to look across the valley to the farmhouse among the trees or on the face of a workman on a high city building looking over the country where he hoped some day to have a home. It is the "joy in the job" which lifts the man and his work out of discontent and drudgery.

The man I spoke of who has grown sour and bitter as the years went by has made all his jobs joyless and dry because he has put no spirit or personality into them. Any one of half a dozen jobs which he has taken up offered him the chance for taking joy in it, but he couldn't find the joy. You cannot find any so-called "great" man or any fair approach to a happy man, who did not find his greatness or his happiness in "the joy in the job." I might go on for an hour with illustrations or arguments to prove this, but it is one of the things which men must think and work out for themselves. *Take joy in your job.*

FRUIT BUDS.—The mercury touched about eight degrees below at Hope Farm. Under ordinary conditions this would not put the peach buds over the danger line, but this year conditions are not ordinary. The warm Fall and early Winter induced some of our buds to take a little too much "joy in the job" and they were soft and tender. There may be some damage on the eastern slopes, but not much, I hope. On the western slopes the buds seem to be in better condition, and we still expect a fair crop. In some other localities much more damage has been done. In parts of New England Jack Frost certainly took "joy in the job" and rubbed the joy in. However, those Yankee peach growers can try the homeopathic cure on such troubles. They usually have such joy in their job that it will offset Jack Frost's mirth, and so they keep good natured. Except for this danger to peach buds the Winter has gone well at Hope Farm, and the time has actually come for developing the next season's campaign.

BELGIAN HARES.—A number of good friends seem to regard the Hope Farm man as a "back number" because he does not try to "boom" the Belgian hare business. My scrub hens require more "booming" than I can develop to make them lay. One thing at a time. These "back numbers" are not all candidates for the scrap heap. Not long ago a man was willing to pay $10 for a certain back number of THE R. N.-Y. I never could develop any "joy in the job" over Belgian hares. The children have kept rabbits from time to time, but beyond the pleasure of keeping pets there was nothing to it. Several people have told me about the great profits in these hares. To prove it they gave names of parties who bought the animals. I wrote these dealers and this is what I get from one of them:

The handling of these rabbits by us is not for market use, and there is very little demand for rabbits for market use, but they are used for experimental work with various laboratories throughout the country. However, just now the demand is on the decline, and the prices have very much declined on the same. While no doubt the demand will keep up for the coming year, I doubt whether they will bring over 15 cents a pound.

J. HOPE.

That is about what I expected. The meat markets here indicate no particular demand for rabbit meat. The "joy of the job" seems to come in selling these hares for breeding stock, with a limited demand at that. I shall stick to my scrub hens.

H. W. C.

Orchard Trees on Cleared Land.

I have a tract of land from which I have cut the timber. It is high and rolling, real hard-wood forest land. I am thinking of putting it out in fruit trees, such as apples, cherries, pears, plums and peaches. Do you think by keeping the brush cut down and grubbing the trees I can keep them growing until I have the small stuff killed out, and can plow and cultivate? How would sawdust do as a mulch the first year on the young trees? Would it be policy to plant apples 24 feet apart and keep them cut back? How would leaf mold do as a mulch? W. C.

Brunswick, O.

It is possible to follow a plan of this kind and obtain fair growth to the tree, but you cannot hope to make your trees grow as fast as you could if they were given thorough culture from the beginning. Our own plan is to cut off the timber and burn the brush. Then mark out lines 20 feet apart through the cleared field. Blow, or dig out the stumps on these lines, so as to leave a clear space four or five feet wide. Set the trees 20 feet apart on these lines, sighting, so as to have even rows each way. We plant "fillers," so that when they are finally cut out, there will be an orchard of standard apple trees, 40 feet apart each way. By clearing out these lines, you can give a little cultivation by plowing a couple of furrows on each side of the road, and keep at work with a cultivator. Do not use fresh sawdust, as a mulch around the trees, unless you add lime also. The sawdust and also the leaf mold are too sour to use when fresh. Clean up the middle between the rows of trees, as you get opportunity, keeping up the cultivator on these narrow strips each year, or hoeing around the tree. By the time the trees come in bearing, the ground will be reasonably clear, and you can handle it as you please. This plan, with modification to suit conditions, will work out fairly well. The great danger is from fire. In a dry time, such a fire would sweep through the woods and do a great damage to the young trees. This is not an ideal way to grow trees. It is a makeshift which may give fair satisfaction.

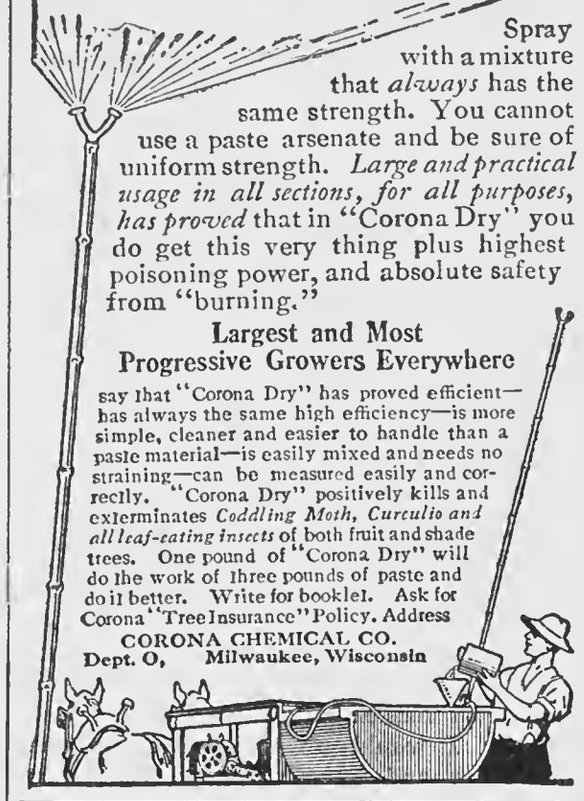
THE "EVER-READY" JR.
POWER SPRAYER

is just what many orchardists have been looking for—it is just the Sprayer for the fruit grower who has not enough trees to afford a large power sprayer and too many for a hand pump. **"Ever-Ready" Jr.** will spray the top of a 40-foot tree without use of tower or ladder. Can be mounted on any wagon, truck, etc. Our **Spray Nozzle** which we furnish with this rig is a **wonder.**

Write us and get full information about **"Ever-Ready" Jr.** whether you are in the market this season or not. Prices will surprise you.

VAN NOUHUYS' MACHINE WORKS
40-46 Liberty St. :: :: Albany, N. Y.

"CORONA DRY"
Arsenate of Lead
Patented June 10th, 1913
Eliminates guesswork. Standardizes the strength of the spray mixture. Saves work in mixing—no straining needed.



Spray with a mixture that *always* has the same strength. You cannot use a paste arsenate and be sure of uniform strength. *Large and practical usage in all sections, for all purposes, has proved* that in "Corona Dry" you do get this very thing plus highest poisoning power, and absolute safety from "burning."

Largest and Most Progressive Growers Everywhere say that "Corona Dry" has proved efficient—has always the same high efficiency—is more simple, cleaner and easier to handle than a paste material—is easily mixed and needs no straining—can be measured easily and correctly. "Corona Dry" positively kills and exterminates *Codding Moth, Curculio and all leaf-eating insects* of both fruit and shade trees. One pound of "Corona Dry" will do the work of three pounds of paste and do it better. Write for booklet. Ask for Corona "Tree Insurance" Policy. Address

Ruralisms

THE SHALLOT.

I was interested in your reply to the query regarding the shallot, on page 75. In English and European gardens, small holdings, and allotments, the shallot is one of the crops that is never absent. The bulbs are so easy to manage; indeed it might be said with truth that they manage themselves. The ground is merely well dug and then somewhat firmed, and the little offsets or bulbils are pressed with the fingers into the surface of the soil to half their depth. This operation is done in the southern half of England in January, for the Winter there is rarely so severe that outdoor operations are altogether stopped even then. In any case the planting is done at the earliest opportunity after the second or third week in January. Ten or twelve degrees of frost (20 to 22 deg. above zero) will not injure them. In the Atlantic States the end of March would possibly be early enough to plant them, and they would mature faster than in England. July is the month for harvesting, by which time the one original bulb will have developed half a dozen others around it in a cluster. Quite a large crop can thus be got off a tiny plot of ground, as the rows are only one foot apart, and the bulbils 6 inches apart in the row. When nearly ripe they are lifted and spread on the soil to dry and are then roped or stored in a cool dry loft or cellar until wanted. Being no larger than walnuts, they are suitable for pickling or for flavoring. The common shallot and the Russian or Large Red are the sorts chiefly grown.

LONG ISLANDER.

APPLES ON LONG ISLAND.

I was much interested in what you had to say of apple growing on Long Island. Having been judging fruit on Long Island, at Mineola, for over 25 years, and at Riverhead for 15 years, I can fully agree with you that Long Island can and does grow the best of apples and peaches. The improvement of the apples has been very marked in the last four or five years and new exhibitors like Peter E. Nostrand have come in. His exhibits have been of the highest standard. They show at their best at the Mineola Fair, where they are entered as a collection. At Riverhead there are no collections shown, but single plates. His situation is peculiar, at the extreme end of the island, surrounded so by water, it may be said that it is not a fair expression of what Long Island can do. I would call your attention to an orchard near Roslyn, L. I., set some 12 years ago. This is owned by a daughter of the late Samuel Taber, and has been under her sole direction. I was asked by her to select trees to plant a certain space. This at 40 feet each way took 84 trees. They were to be selected not as a commercial plant, but for private use, early to latest. There were 24 varieties, as my judgment as to the quality, etc., dictated. I thought no more of trees for several years. The next I heard, the owner came to me at the Mineola Fair, in great spirits, saying that she had taken second prize in 20 varieties, first for best 10, first for best five varieties, first for each single plate variety exhibited—a pretty good show for a beginner.

"Now I want thee to come see the trees that thee got for me." I could not resist. I found the finest 12-year orchard it has been my privilege to visit. The lady said: "I have had the whole directing of them, from the planting. The first seven years they were tilled and well fertilized, then the grass was allowed to grow and all cut and used as mulch, none removed. The trees had been trained low. I could sit on a milking stool and pick a bushel of as fine Fall Pippins as is seldom seen these days, so with all. A six-foot step-ladder would reach the highest." This is near the center of the island, and there are hundreds of acres which with the same care will do as well. The scale seems to have met an enemy that has made it easy to control. The west end of the island has been so demoralized by the high cost of land that people have sold, and it is in the hands of speculators. Suffolk County has a great future in fruit growing if they will follow the example of Mr. Nostrand, or F. A. Sirrine, who has done fine missionary work there. May they be followed by others!

N. H.

Azaleas from Seed.

I would like to raise Azaleas from seed. Will you advise what is the best method to follow in the glass-house and then in the open when the seedlings are transplanted? I have reference to the Azalea mollis, which is considered fairly hardy, and choice varieties of A. Indica. L. K.

Stamford, Conn.

The hardy Azaleas are usually increased by seed sown as soon as ripe, or in early Spring, in boxes placed in greenhouse or frame. The soil is sandy peat; the seeds are scattered on the surface, and a little soil sifted over them, then well-watered. Seed may also be sown in live sphagnum moss where it germinates promptly, but the seedlings must be moved as soon as they can be handled. As soon as the little plants appear, they need plenty of air, and a daily syringing. In Fall they are transplanted into boxes or frames, the proper soil being sandy peat. The second year, in Spring, they are planted out in well-prepared beds, with space for two years' growth; long and ungainly shoots should be pinched back to form a compact plant. The tender Indian Azaleas are rarely grown from seed, the usual practice being to propagate from cuttings of half-ripened wood taken in August, and placed in sand with gentle bottom heat. Seed may be treated, however, like that of the hardy sorts, only of course the young seedlings would be given greenhouse treatment, instead of being planted out in beds.

Tariff on Gladiolus.

Will you let me know what the rate of duty on Gladiolus bulbs is under the new tariff schedule, also the rate on Gladiolus bulblets? E. P. W.

Ohio.

Here are the sections of the new tariff bill which relate to flowers and nursery stock:

215. Orchids, palms, Azalea indica, and cut flowers, preserved or fresh, 25 per centum ad valorem; lily of the valley pips, tulips, narcissus, begonia, and gloxinia bulbs, $1 per thousand; hyacinth bulbs, astilbe, dielytra, and lily of the valley clumps, $2.50 per thousand; lily bulbs and calla bulbs or corms, $5 per thousand; herbaceous peony, Iris Kaempferi or Germanica, canna, dahlia, and amaryllis bulbs, $10 per thousand; all other bulbs, roots, root stocks, corms and tubers which are cultivated for their flowers, or foliage, 50 cents per thousand: Provided that all mature mother flowering bulbs imported exclusively for propagating purposes shall be admitted free of duty.

216. Stocks, cuttings, or seedlings of Myrobalan plum, Mahaleb or Mazzard cherry, Manetti, multiflora and briar rose, Rosa rugosa three years old or less, $1 per thousand plants; stocks, cuttings, or seedlings of pear, apple, quince, and the Saint Julien plum, three years old or less, $1 per thousand plants; rose plants, budded, grafted, or grown on their own roots, 4 cents each; stocks, cuttings and seedlings of all fruit and ornamental trees, deciduous and evergreen shrubs and vines and all trees, shrubs, plants and vines commonly known as nursery or greenhouse stock, not specially provided for in this section, 15 per centum ad valorem.

THE HARDIE SPRAYERS

are noted for their

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

FOR the past few years we have been talking of increased corn production in New England. As a result much more corn is now grown than formerly. Now comes Kansas preaching "a rival of corn growing." It seems that the boom in wheat and Alfalfa has actually reduced the production of corn!

*

THE most important house in this country is the farm home. The most important inmate is the farmer's wife. Her most important room is the farm kitchen. The most important asset for the equipment of that kitchen is an unlimited supply of dry fuel and pure water. Now gentlemen, you know how to touch the most important things of life with your own hands.

*

WHENEVER you sow clover seed in soil which you feel is likely to be acid we advise mixing seed of Alsike with Red. On our own soil the Alsike is a surer crop, as the land is naturally sour. The Alsike does not give as heavy a crop as the Red or the Mammoth, but it grows in well with the other sorts and adds to the feeding value. Mixing in Alsike in this way is much like adding Red-top to a seeding of Timothy. Both Alsike and Red-top are acid-soil plants.

*

WE may get this egg-laying contest into the line of sport yet. The Hope Farm man now hears of a breeder who says he will back a pen of his birds against any other pen in the country for $1,000. We will try to hunt him up and see what strings are tied to that offer. Another man offers to hatch 50 eggs from blue-ribbon, high-scoring stock and enter a pen of the pullets. Our object is to bring out pens of definite breeding and definite methods of handling, so that the results will teach us all definite things.

*

WE are experimenting in every possible way with parcel post—chiefly in buying farm-raised food. Thus far we have bought a great variety in this way. The quality has been excellent, and the price is such as to give an average saving of at least 20 per cent over retail prices. The farmers who ship the food claim to obtain more for it than from ordinary trade. Those who have sent us food thus far surely seem to have what the Hope Farm man calls "joy in the job." We believe that this direct trade in certain kinds of food is sure to grow into a tremendous volume as time goes on.

*

FOR a current topic Mr. Harry Demarest talked about the problem of the farmer, the two spears of grass, and the consumer's dollar. When a man pays a dollar for something produced on the farm it appears that only 35 cents of the amount gets into the pocket of the farmer. Where the other 65 cents goes to is not clear. It also appears that the farmer reaps no advantage from a large crop of anything; he gets just as much money for small crop; and the consumer pays a high price in any event. There was some discussion by Mr. J. H. Crissey, Mr. Henry Pelton, and others, but the hole in the skimmer was not discovered by all present.

That is taken from a local paper printed in the Warwick Valley, N. Y. It is part of the report of a meeting of a local club. We print it to show how this question of the 35-cent dollar is being torn apart and analyzed, while five years ago few people would pay any attention to it. Now you cannot find a gathering of country people at which the 35-cent dollar is not discussed. And in all this discussion no one is able to prove that this clipped dollar is not a real thing. This is what we have called making the 35-cent dollar "a part of popular thought." That is the only way to doctor this dollar, for when people really *think* about it they will find a way to change conditions.

*

MANY of our readers must be of an inventive turn of mind, for we have hundreds of questions about how to obtain patents. One man says he wants a manufacturer to make a model of the invention before it is patented, and he is afraid the manufacturer may rob him of the invention. An inventor should file with the U. S. Patent Office in Washington, a preliminary application before turning over to a manufacturer his plans for a model. The patent office only occasionally requires a model on final application. In any event the preliminary application protects the inventor.

*

On page 164 H. C. T. writes about sulphured oats. I wish to commend most sincerely your note. I came to this place to start my chicken business, and of course was not thinking that I would get handed such a lemon out in a country village 78 miles from New York city. I got four bushels of oats from the mill here, and they knew that I wanted them for sprouting. They never said a word about sulphur to me, knowing well, as they later admitted, that they were sulphured and would not sprout. I think that fake sulphured oats should be aired most thoroughly. H. W. P.
Dutchess Co., N. Y.

You will have to blow air through it to drive the sulphur out. These are little frauds, but the big ones rest upon them. The sulphur is used to make the blackened and damaged oats look like fresh new grain. Of course the dealers who sell them know the life has gone from such oats so they will not sprout. Of course they know what the poultrymen want them for. It is a mean, dirty little fraud. The man who does this ought to go where a double dose of his sulphur will be applied!

*

THE Department of Agriculture, in arguing for better household conveniences, and management relates the following incident:

One of the specialists of the Office of Farm Management learned from a woman in Pennsylvania, who had broken down from overwork, that she had been carrying coal from the barn for years. When the husband was asked if there was any reason why a coal bunker could not have been provided near the cookstove, and filled directly from the wagon, he answered there was none, but that no one had ever thought of it. This one detail has been found neglected in other cases where it could have been easily remedied, if only some one had thought of it.

It is probable that this same explanation would be given in many other similar cases. "Mother" is often patient and uncomplaining and the habit of doing hard and unnecessary things becomes fixed before she or the rest of the family realize it. It is human nature to think of the so-called "great" things in the world, while we forget the smaller yet more essential things. They are "more essential" because the great things grow from them and are flavored by them. Do you know of people who give time and money to missions, temperance and similar things while "mother" has to get her own fuel and draw water out of a distant well? Think a moment and you will see that every one of these "great" things would be advanced if the fuel and water problems were settled.

*

DURING the four years since January 1, 1910, there has been a decrease in this country of 7,305,000 meat animals. At the same time we increased in population nearly 7,000,000 people. To put it another way, the Department of Agriculture shows that as compared with 1910, we are short nine beef cattle, seven sheep and more than three hogs for each 100 persons. Year by year, therefore, the available supply of home-grown meat is growing shorter. There should be over eighteen million more meat animals in this country to make the same proportion to the number of inhabitants that we had in 1910. There is a slight increase of dairy cows, horses and mules in numbers, but the meat problem is now harder than it was ever before. Among the reasons given for this decrease probably the most important is the following:

The decline in stockraising on farms in the East and South because of poor marketing facilities, resulting from many local slaughtering establishments having been driven out of business by the competition of the great central slaughtering establishments of the West and Central West.

This is unquestionably true, for if it had been possible during the past 20 years to keep up the local slaughter-houses and meat markets which were found through the Eastern States, millions more of calves would have been kept and grown for market purposes. The increase of meat-production of our eastern farms will not be felt until better market facilities are worked up. We believe that this problem will be solved in the future, so that local meat producers will be able to turn off their stock at profitable prices. There will be direct trade more and more with consumers, and local markets either under Federal or municipal control, where stock can be slaughtered and distributed with some show of competition. When that is done the trouble will begin to correct itself. Until these marketing facilities are developed, it is idle to ask eastern farmers to increase their meat supply. Here is one of the most thoughtful situations ever known in American trade. Under the unrestricted law of supply and demand beef making should provide a profitable enterprise for thousands of Eastern farmers. The operations of the beef trust have upset this law, paralyzed the industry and left this nation in the way of depending upon foreigners for more of its meat.

*

SINCE we printed a statement of the Employer's Liability law in Connecticut there have been many requests for the facts about the New York law. Does it make farmers and housekeepers liable for injuries to servants or workmen? The attorney-general declines to make a ruling on this point, because the law is in charge of a commission whose duty it is to interpret the law. He points, however, to a paragraph in Section 3, which reads as follows:

4. "Employee" means a person who is engaged in a hazardous employment in the service of an employer carrying on or conducting the same upon the premises or at the plant, or in the course of his employment away from the plant of his employer; and shall not include farm laborers or domestic servants.

This makes it clear and there can be no question about it, for the law states that the word employee under the law *"shall not include farm laborers."* Thus farm laborers and domestic servants are expressly excluded, and farmers are not made liable. When the Connecticut law was passed it was thought that employers who had less than five hands were excluded and small farmers were told that they were exempt. When the law comes to be enforced the lawyers found a "joker" in it which made farmers liable the same as other employers. In Connecticut farmers are generally taking out insurance for protection in case of injury to hired men.

*

THE Attorney-General has given his opinion on two disputed points under the Commission Men's law. Various commission men claim that where they were subjected to the discipline of an association, a board or an exchange, they are relieved from the necessity of giving a bond and taking license under this law. The Attorney-General decides that this does not relieve them of the legal responsibility. These commission men claim that the shipper is amply protected when they belong to an exchange. The Attorney General rules as follows on this point, which would seem to settle it conclusively:

The fact that the consignor has in a measure protected himself by the use of a draft or because the commission man has subjected himself to the control of his exchange or association would not place the latter outside the purview of the statute. Such precautions and discipline may add greatly to the safety of the transaction and secure the credits of the merchant, but such private arrangements are not recognized as supplanting the law.

The same thing applies to a case where the shipper attaches a draft to the bill of lading and forwards it with the grain or other produce. In such a case the dealer must pay the draft before he can obtain possession.

The Attorney-General holds, as is seen in the above, that this does not place the commission man outside the law, and he will be obliged to subject himself to bond and license. In another case the claim is made by grain and hay brokers that they do not combine the business of the commission merchant, and therefore they claim that they should not be licensed or give a bond. The Attorney-General gives a long opinion to show the difference between a broker and a commission man, and he concludes that whenever such a broker combines with his business in any way that of the commission merchant, he must take out a license. When he does a grain brokerage without any commission whatsoever or without dealing in commissions, it seems doubtful if he could be made to give a bond and take out a license.

BREVITIES.

TIME to get out the knife and saw for pruning.

"I had thought I would have to do without THE R. N.-Y. for the first time in 35 years, but my scrub hens came to the rescue and laid me some three-cent eggs, so here is your dollar for another year. May the Hope Farm scrubs do as well," says E. M. C., of Kansas. The Hope Farm scrubs have not paid for many subscriptions yet, but they are young and so is the contest.

THE STORY OF A CO-OPERATIVE SUCCESS.

PART I.

[At the recent meeting of the New York State Agricultural Society, Mr. L. G. Tuckerman read a strong paper giving a history of the Hudson River Valley Exchange. We are very glad to give it here.]

THE BEGINNING.—In March, 1912, C. E. Thurston of New York and W. Y. Velie of Marlborough, called upon number of farmers in the district from Newburgh to Highland to discuss a plan for coöperation among the fruit growers of the Hudson River Valley with a view to improving our marketing conditions. The result of their efforts was a meeting of some 40 men in Milton, when the subject was discussed, and a committee of five appointed, of which I was one, to draft a constitution and by-laws for a coöperative association, and report at a meeting a fortnight later. The committee finally adopted the following preamble:

The object of this exchange shall be to encourage the coöperation of the fruit growers of the Hudson River Valley for the protection and advancement of their common interests.

1. By securing and disseminating such scientific and practical information as shall promote the general advancement of the fruit-growing interests in this district, and shall tend to the improvement of the quality and quantity of our products.
2. By securing such legislation as may be advantageous and preventing that which may be detrimental.
3. By securing such improved facilities in transportation as shall tend to give us more expeditious and economical distribution of our products.
4. By endeavoring to secure a better and more uniform system of packing and package.
5. By devising some system of marketing our products, as shall open up and develop markets, and to give the growers a fair and remunerative return.
6. By endeavoring to obtain such improved system of crop reports as shall furnish accurate information concerning production, thereby enabling the fruit growers to know the exact situation.
7. By coöperative purchase of such supplies as are needed by the members.

FORMING THE COMPANY.—We determined that it would be advisable to incorporate a company, venturing slowly, as this was a new deal to us all. We set the capital stock at $2,000, divided into 100 shares at $20 each, no member to own more than four shares. Stock does not carry voting power. Each registered member has one vote only in the Hudson River Fruit Exchange, Inc. The government is vested in an executive committee of five, who were chosen in 1912, one for three years, two for two years, and two for one year. As these terms expire members are elected for terms of three years. We thus always have three men familiar with the work. This committee annually, from its members, appoints the officers for the year. All are subject to recall by the exchange. Three articles of the by-laws should be read in full:

Art. VI. Members of this Exchange bind themselves when consigning fruit, to ship only to commission houses or auctions duly designated by the Exchange. They also agree to ship all fruit up to grade under the label of the Exchange, and fruit not up to grade without the label.

Art. VII. Fruit sold through the Exchange f. o. b. shipping point or on track shall pay to the Exchange a commission of 3 per cent. of the gross price. In such cases the Exchange stands behind such sales and guarantees the price to the grower. The members reserve the right to negotiate private sales on which no commission shall be due the Exchange.

Art. XIII. At the end of each fiscal year, after all the expenses of the Exchange shall have been paid, the executive committee shall from any surplus remaining, declare a dividend not exceeding five per cent. on the par value of shares issued. The entire balance of such surplus shall be distributed among the members who have shipped fruit through the Exchange during such year in proportion to the value of their respective shipments.

The last sentence of Art. VII caused much discussion, and many members feel that it should not be in, and we have made efforts to have it removed, but I regret to say that it still stands. I shall take up this matter later on.

STARTING THE WORK.—It was May before we were incorporated and ready to begin work. As secretary-treasurer, it devolved upon me to find a manager. Answers to advertisement were varied and curious, but a man in Minnesota seemed to fill the bill, though many members felt that anyone totally unacquainted with this region would never do. But this man's references were so good and his letters were so clean cut that I wired him to come on, and we hope he will never leave us. I tell you this because the manager is the heart and soul of any coöperative concern. It was June when he took hold, an utter stranger in the community, with 30 scattered members willing to try an experiment. That was about the size of it. But the manager hustled. Our commission men were chosen with a view to concentrating our shipments to prevent competition with ourselves and to let buyers know just where our fruit was to be found. The houses chosen were naturally men we were used to and had confidence in. The custom in our section has been for such houses to pay their agents three of the 10 per cent. charged the farmer for selling. We arranged with most of our houses that the Exchange be made agent and receive that three per cent. on all produce consigned by members of the Exchange. That was to be our source of revenue.

MARKET REPORTS.—Mr. Hilderbrand, our manager, arranged to supply complete market reports to our members each morning by 'phone. Until then few of us had been able to get any reliable reports, and the custom of the many local buyers had been to use this ignorance very much to their own advantage. For instance, those buyers receive from their houses in berry time 10 cents per crate for buying, and each morning receive word as to what they shall pay, let us say, for strawberries that day. Supposing the price given them be 10 cents per quart. Under the old system the buyer paid what he could make the grower accept, and pocketed the balance. The Exchange entered the field and paid the full daily price as well as giving complete market reports, with the result that for the first time in our section the local price of berries was kept on a par with the wholesale prices in the Eastern markets. This made men take notice, and in spite of the hardest kind of knocks from buyers and outside commission men we began to receive applications for membership.

THE NEW CURRENCY LAW.

PART I.

[We have had many requests for a synopsis of the new currency law. The following has, therefore, been prepared.]

"An Act to provide for the establishment of Federal reserve banks, to furnish an elastic currency, to afford means of rediscounting commercial paper, to establish a more effective supervision of banking in the United States, and for other purposes." "The Federal Reserve Act," to use its short title, was approved by President Wilson, December 23, 1913, and was the Administration's Christmas gift to the American people. Within five weeks over 5,000 national banks have notified the Government of their desire to become a part of the new banking system. Only five banks in each of our two largest cities remain to be heard from in favor of becoming members. The largest bank in the United States, the National City Bank of New York City, having a capitalization of nearly $300,000,000, has asked for membership. To date only two national banks have declined to join. It now seems certain that the combined banking systems of the country will soon be members of a system of banks that will exceed that of the combined capital of the Bank of England, Bank of France, Bank of Germany, and Bank of Russia.

FEDERAL RESERVE BOARD.—The new banking system is to be controlled by a Federal Reserve Board of seven members, the Secretary of the Treasury and the Comptroller of the Currency of the United States to be members ex-officio. The five members are to be appointed by the President of the United States by and with the consent of the Senate. The salaries are to be $12,000 a year and necessary travelling expenses. The first board is to be appointed for terms of two, four, six, eight and 10 years, and thereafter for terms of 10 years. Their salaries and expenses are paid by the Federal Reserve banks. Each member is to devote his entire time to the duties of the office, and cannot hold office in any bank at the time nor for two years thereafter. The Federal Reserve Board is authorized to examine the accounts, books, and affairs of the Federal Reserve banks and the member banks; to publish a weekly statement of the condition of Federal Reserve banks; to permit or require Federal banks to rediscount paper of the member banks and fix the rates of interest; to supervise the issue and retirement of Federal reserve notes; to suspend or remove any officer or director of any Federal bank; to require the writing off of doubtful assets of Federal banks; to suspend the operations of any bank for violating the provisions of the currency law; and to exercise general supervision over the Federal Reserve system. This Reserve Board is similar to the Interstate Commerce Commission in several respects, but has a larger degree of control.

FEDERAL RESERVE DISTRICTS, CITIES AND BANKS.—The United States is to be divided into not less than eight nor more than 12 districts which are naturally the banking territories of from eight to 12 large cities. In each of these cities is to be established one Federal bank. The Federal Reserve districts are not made with any regard to State lines. No Federal Reserve bank can have less than $4,000,000 subscribed capital stock with which to begin business. The new system is being organized by an "Organization Committee," composed of the Secretary of the Treasury, the Comptroller of the Currency, and the Secretary of Agriculture." Every national bank in the United States and every eligible State bank or trust company must signify in writing before February 20 its acceptance of the terms and provisions of the new law. The National banks that fail to come into the system lose their national charter. Each bank coming into the system is called a "member" bank, and is required to subscribe to stock in the Federal Reserve bank of the district in which it is located. Each bank must take stock to an amount equal to 6% of its capital and surplus. Individuals and corporations may take stock not to exceed $25,000 in amount. If the amount subscribed by banks and individuals and corporations is not deemed sufficient by the Organization committee then the committee allots to the United States the balanced required. F. N. C.

ANOTHER FORM OF DIRECT TRADE.

I am not a farmer, but have taken your paper for some years to keep me good-natured after riding home in the Subway at 6 p. m. I have seen a great deal in THE R. N.-Y. about that 35-cent dollar the farmers are getting, or sometimes no dollar. Where I am employed there are 15 married men who are fond of good food and fair prices for the same. I have a crate of eggs sent to me every Monday, another man potatoes and butter. They are all taken at the farmer's price, plus the express or freight. The farmer gets his money right back, we save the middleman's profit, and what we get is A-1. I would say anyone can do the same. A church might help its congregation that way and make a little something. At first the concern found fault because as soon as a crate of eggs came everyone quit work to get his, but the manager soon fell in line, and now asks when the next crate is coming. I get my eggs from Vermont, and the express is only 53 cents on a crate. Farmers could combine and get all there is in it this way, and not write your paper to collect bad debts for them. G. H. MORSE.
New York.

We print this as showing another way to direct trade. In this case it is coöperative buying rather than selling. Workers in a city factory or store combine and buy in wholesale lots. The goods are distributed here—each man carrying home his own share. As Mr. Morse says, this gives the consumer fresh goods at a fair price, while the shipper has a sure trade with the middleman's tax added to what he could otherwise obtain. The suggestion that churches, clubs and other city societies could use their organization to increase such trade is a good one. The time is surely coming when such work will be recognized as one of the most important services which fraternal societies can work up. There will be no use writing to Mr. Morse for trade, for his society is well supplied, but we print this to show another way in which this direct trade can be developed.

POOR SAMPLES OF MIXED FEED.

We send you three samples of ground grain feed. Our grain dealer, who for years has sold us satisfactory feeds, agreed to furnish us five tons of sample No. 1, if after trial for a week it proved a good mixture for our herd of 20 cows. The cows did nicely on it, and we told him to bring along the remainder. The second batch, sample No. 2, arrived, and after feeding it a few days we noticed the cows fell off a little in milk, and when the third batch arrived and gave poorer results, than the other two, we began to worry and look for a cause. Sample No. 3, is from batch No. 3. We examined the three samples under a reading glass, and it only made us more sure that they are not the same mixture, or at least the same quality as No. 1, which is the best. He not only sent five tons but got eight tons unloaded before I knew it. If the feed is all the same quality I can use all he has sent, but I do not like the thought of paying for mill sweepings. I have not paid him yet, and wish to get your opinion of the deal before I do so. The grain dealer told me by telephone this morning that he would see us next week and would give us satisfaction if we would tell what we wanted. I asked the Director of our State Experiment Station to examine the samples, but he told me that as long as there was no guarantee on the bags he could do nothing. The price we were to pay for this mixture of equal parts oats, oil meal, bran, and two parts cornmeal, was $29 per ton. Is it worth it? Please give us your advice. J. F. C.
Rhode Island.

Under a microscope it is evident that samples 2 and 3 are inferior. Sample 1 appears to be what is claimed for it—oats, oil meal, bran and corn—though a closer examination would be needed to prove it. The other samples clearly contain trash like mill sweepings and oat hulls, and we do not wonder that the cows fell off in milk. In such a case we think the experiment station should act as umpire and state how much inferior these samples are. While the lack of guarantee may take this out of any legal consideration, it is clearly evident to anyone who can see that two of these samples are not worth as much as the other. We think the station can and should tell how much less and then help adjust the matter.

A PHILADELPHIA jury gave a verdict of $8,500 to a boy who lost the use of one eye through an explosion. In New Jersey some years ago a jury decided that a boy "killed by a car had no earning capacity and thus had no value."

Woman and the Home

From Day to Day

FAITH.

When the anchors that faith had cast
  Are dragging in the gale,
I am holding quietly fast
  To things that cannot fail.

I know that right is right;
  That it is not good to lie;
That love is better than spite,
  And a neighbor than a spy;

That the rulers must obey;
  That the givers shall increase;
That Duty lights the way
  For the beautiful feet of Peace.

And that somewhere beyond the stars
  Is a love that is better than fate.
When the night unlocks her bars
  I shall see Him, and I will wait.
—Washington Gladden.

*

OF course the fore-handed woman is now busy with her sewing. January being the season of white-goods sales, it is the time to buy materials for underwear and washing blouses. Colored wash goods, too, appear in these sales, and all these standard materials may be bought at a reduction. We prefer English longcloth for all muslin underwear, because of its smooth weave, soft finish and excellent wearing qualities; it may be secured in many different weights, though nainsook is preferred for finer garments. Where underwear cannot be made at home there is a wide range of choice in ready-made garments, but where economy must go hand in hand with refined taste one gets better value in the home-made article. At present most underwear is scant in cut, and very elaborately trimmed. It is quite instructive to find a plainly made garment of fine material, with no other trimming than a cross-bar muslin hem through which ribbon is run, more expensive to buy than one with a yoke of elaborate lace and embroidery. But then, the coarseness of the trimming is overlooked by the buyer, who wants something elaborate, and who has not learned to discriminate. By selecting good patterns and material, and following the style of the better goods, one secures something far superior at less cost. When neck and arms are finished by a three-quarters or one-half-inch fold of cross-bar through which ribbon may be run, the result is attractive, up-to-date and durable.

*

THE question of house dresses cannot be settled by all women on the same lines. The ideal dress for the working housekeeper is washing material, made in one piece, with convenient fastenings, so that it can be quickly adjusted. However, there are many country houses in the North where, during severe Winter weather, a woolen dress must be worn, and we can only suggest using a material that will wash, and making it on practical lines. Nothing is more slatternly than a once-stylish cloth dress, reduced to kitchen service because it is too shabby for other wear. Percale and chambray are about the most practical wash materials for house dresses, with preference given to the former because it shrinks so little and irons so nicely. And don't make all the house dresses alike in cut or color. We have heard of an economical woman who made all her working dresses and kitchen aprons of the same dark blue percale, which she bought by the piece, so that she could always cut patches out of the worn garments to mend the others. It was economy, no doubt, but it is not likely that she got much pleasure out of her clothes. Years ago, when we were all wearing separate waists and skirts, one energetic woman sent us a description of her working dress, which she wore while employed in the garden. It was made of denim, all in one piece, with patch pockets on both waist and skirt, and seemed at that time a very emancipated garment. Nowadays such dresses are made of khaki and other materials by fashionable outfitters, for hunting and camping trips. In spite of all the comments on extreme fashions, there never was a time when there was more opportunity for making clothes comfortably while at the same time keeping in touch with style, and there is no reason why the working dress should not be attractively made, without losing sight of its usefulness.

The Mother's Charge.

The housekeeper, the homemaker, the mother, who is the mainstay of the home is often sadly neglected, not appreciated, and I for one, was much pleased to find so many pages devoted to her in the December 20 R. N.-Y, only wish it could be a weekly occurrence. We all realize that many mothers are not appreciated by their own family. At whose door does the blame lie? I, having been a public school teacher for many years, had a fine opportunity to make quite a study of this neglect, and the conclusion I have reached from my observations is that it is more often the mother's own fault that she is not given the consideration, the appreciation, she so justly deserves. The mother should reign as queen in her household, but too often she is its slave. Her children should be taught from babyhood up to respect her, to work for her, to love her, and to give her the best.

I think I can illustrate my point in no better way than by giving an actual occurrence that come under my observation some years ago. I was teaching a large Sunday school class of boys just in their "teens." One Summer we went camping for a week. One day was set aside as visitor's day. The parents and friends were to spend the day and take dinner with us. How those boys did work to "fix up" the camp and make everything look fine! Two of the boys, Ed and Walter, were especially anxious that everything should be at its best. When their parents arrived Ed rushed to the carriage, helped his mother out, guided her to the coolest, prettiest spot in the camp, arraigned some cushions in a steamer chair, an' said, "Here, mamma, is a dandy place to rest." In the mean time, Walter had appropriated the best hammock on the grounds, and when his mother, waiting on herself, had removed her wraps and found a seat, nearly his first words to her were, "Mamma, did you bring me a clean shirt?" A homely illustration perhaps, and a seemingly trifling incident, but it gave me quite an insight into the home life of those two boys.

The mothers were both well educated, refined women, blessed with plenty of good common sense, but evidently Ed's mother understood more fully how to train her boy to respect and love her, to wait upon her, in fact how to instil in him habits of thoughtfulness, carefulness and unselfishness, that would make of him a man always ready to extend a helping hand and give a kind word to the needy and discouraged, wherever he found them. Walter's mother loved her boy and thought she was doing her best for him by waiting on him, by doing everything for him. She did not understand the effect of habit, especially on children. Mark Twain quaintly put it that, "Habit is habit, not to be flung out of the window carelessly by any man, but coaxed down stairs one step at a time." She did not realize that this "coaxing down stairs one step at a time," was much easier done in childhood, and would not only save herself and her boy a world of trouble as the years went by, but would be the making of a man of him in the true sense of the word.

It is the duty of every mother of future men and women, to make the most of what she has, to train those boys and girls to look beyond their own wants to the needs of others. The quicker she realizes that she is not doing this by making a slave of herself, the more easily will she be able to develop in her children the traits of patience, unselfishness, obedience, gratitude and appreciation.

Blessed indeed are the mothers who have a goodly supply of gumption—that is; those qualities which make strength of character, which give the power to see and do aright. The word "gumption" is strictly Hoosier and they say "Gumption is the ability to put the grease where the squeak is." May the mothers of our land leave no stone unturned until they realize fully just what and where the squeak is in their household, and then apply the grease with such a liberal hand, that all our boys and girls will soon have such well developed bumps of gumption they will be ever ready to lend a hand to help.

E. M. S.

Warmth and Ventilation.

Baby John, who is three and a half, has his own little bed, of course, and as he is a fresh air baby, he is used to sleeping with the temperature of his room the same as that out of doors. Last Fall he was promoted to a new crib, one of those little white iron beds whose sides let down and are put up at night, fastening baby in securely. He was very fond of his little new bed from the first and needed no coaxing to be undressed at seven o'clock. In fact he began at this time to make himself ready for bed. All went well until severely cold weather set in, when baby awoke in the early morning hours, shivering and whimpering. Mother had to take him into her bed, which was only a few steps from the little one. This happened every cold night for a week or more, and then mother began to think something must be done. Baby wore as warm night clothes as seemed necessary, and his bed covering was both light and warm. Then she examined the new bed thoroughly. It had a rather light ready-made mattress which came with the bed. Over that was a mattress pad of tufted cotton and then a small homemade mattress made of wool. It ought to be warm enough, but the fact remained that it wasn't.

Now upstairs in the storeroom was a big sack of downy duck feathers, just the very thing, thought mother, and that very day she made a sack of new ticking to fit the little bed and emptied the light, fluffy feathers into it. Baby John helping (?) and very much interested. Then it was made up in the little crib and no complaint since has been made of the cold.

In Switzerland, feathers are commonly used as a filling for comforts, making the lightest, warmest possible of bed coverings. Plenty of pillows help to keep one warm, not putting them all under the head of course; one tucked in at the back is a real comfort in zero weather as is also a hot water bottle or soapstone made up at the foot of the bed. Feather beds are out of fashion and justly so in warm weather, but they may be rendered sanitary by live steam, and for outdoor sleeping furnish warmth and comfort not to be despised.

F. J. F. F.

GREAT men are they who see that spiritual is stronger than any material force; that thoughts rule the world.—Emerson.

Better Walls

Without Plaster

Have better walls and ceilings at half lath-and-plaster cost. Do the work yourself. Save time. Save money. Save after-trouble—after-expense. Use Bishopric Wall Board. Clean. Dry. Nails to studding. Takes any paper, paint, kalsomine or burlap. Comes in handy sheets. Can't crack, warp, shrink, buckle or pull loose.

BISHOPRIC WALL BOARD

"Can't Crack, Buckle or Pull Loose"

is the only wall board made with laths. These are imbedded in a heavy layer of Asphalt-Mastic. Also proof against damp, cold and wind. Turns bare spots into cheerful quarters.

Three Things Free

Write today for descriptive book, model house plans and sample of Wall Board. No charge. No obligation. They will save you many dollars.

Water Glass Floor Paint.

This is certainly invaluable. Smooth off the floor, filling all the cracks with filler or putty and then paint it with a coat of sodium silicate (soluble glass), the same used to preserve eggs. It will also preserve floors and save the back of the woman who has to scrub and clean them. The water glass dries immediately and three coats should be put on one after the other. If you wish to change the color of your floor, add yellow ochre or vandyke brown (water colors, not oil). Try on a board until color desired is obtained. When paint is dry cover it with a coat of varnish comprised of three parts linseed oil and one part Japan drier, mixed. Any kind of floor or old furniture may be treated in this way. I. M. B.

Rare Northern Visitors.

One of the pleasures of the Winter season on the farm, is the watching of our bird visitors. The chickadees and nuthatches soon become very bold and familiar, and occasionally the eye is gladdened by the sight of some rare northern species, driven by the rigorous cold from the higher latitudes which are their home, to Central New York. Sometimes the snow buntings sojourn in our fields or the northern shrike pays us a visit, and once, a great snowy owl remained for several days in the vicinity, upsetting everyone's notions of owl habits by appearing boldly by daylight. We were much interested when, in December of the present season, the news spread that a rare water fowl had been captured alive by some boys of the neighborhood. It proved to be the white brant, or Arctic goose, a bird seldom seen in the Eastern United States, though common in the Middle West and on the Pacific coast. We went to see him and pitied his sad plight; he was confined in a small poultry house with a flock of cackling hens. He was a splendid fellow with a lordly bearing and long, powerful wings with which he could strike a staggering blow. Poor bird! We could not save him from being killed and eaten, but we indulged a hope that the new national laws for the protection of migratory birds may preserve his race from extinction.

In the first week of January, we had a fresh surprise. Some strange birds were found feeding on the seeds of the ash trees bordering the roadside. They lingered for several days and were seen by different members of the household, none of whom was able to identify them. One afternoon, I noted a flutter of wings in a tall ash tree near the corner of the orchard, and I knew that my chance had come. Then I, a middle-aged woman, and I feel no shame in the telling, dropped everything and went bird hunting. Approaching cautiously, I found a flock of 30 birds, about the size of robins, busily feeding in the branches. I knew at once that they were pine grosbeaks, for I had conned the description in Blanchan's "Bird Neighbors" until I had it by heart. They used their heavy bills with much cleverness, stripping off every seed, and littering the snow with the empty hulls and broken stems. All the while, they kept up a low-toned twittering that sounded at a little distance like the tinkle of distant sleigh bells. They were led by a fine male whose head and back were brilliant red in color, while the wings were marked with black and white. The rest were females and young males, the former in rich brown attire, while the latter had reddish tints on head and back. As I stood in the snowy road, watching them at a respectful distance through the glass, they suddenly swept down and alighted in a small apple tree barely 10 paces from the spot I occupied. Then, while some preened their feathers in the tree, others fluttered to the little spring near the roadside fence and drank their fill. The snow-covered landscape, and the group of handsome birds, hovering about the little pool, made a picture which will never be forgotten.

I have felt some resentment toward the woman writer who declared in one of her books that the things that country people do not know about objects in nature would fill not one, but several volumes. The statement was quite true at the time, but couldn't she have admitted that we had not a fair chance? We could not spend long hours watching bird housekeeping through an opera glass as she did. The books on bird life of 20 years ago were scientific works, full of long, hard names, intelligible only to the scientist. These conditions have changed in the last few years. We now have splendidly illustrated nature-study books, bulletins and trained teachers to help us. So, in most instances, we have only ourselves to blame, if, when approached by the person who wants to know, we are unable to answer his questions intelligently.

Live Stock and Dairy

FINE INCOME FROM BUTTER COWS.

I am most interested in a subject which I don't see discussed in THE R. N.-Y. very much, viz., the amount of butter obtained from a cow per year; the average for the dairy, and of course how much I get of the "consumer's dollar." In the case of butter with me I get pretty nearly 100 per cent., as I sell most of it direct to the consumer, delivering each Saturday forenoon direct to customers in this thriving village of about 1,500 population. My list includes many of the best families, whom I supply Summer and Winter. For the year ending as given in the table below is given the average per cow, average number of cows and price:

November 1, 1911.—Pounds butter, 422; per pound, .3037; returns per cow, $128; grain purchased, $25; number of cows, 20.6.

November 1, 1912.—Pounds butter, 392; per pound, .346; returns per cow, $135.63; grain purchased, $25; number of cows, 21.6.

November 1, 1913.—Pounds butter, 404; per pound, .366; returns per cow, $147.80; grain purchased, $30; number of cows, 22.

After paying for the grain that certainly leaves a good market price for what is raised on the farm, and still some for us who do the work. My brother-in-law and myself buy our grain in car lots, a year's supply at a time, when price seems lowest, sometime in the Summer. We never have had any trouble to get what credit we wanted, which has not been much.

I try to have my cows freshen in the Fall, and have silage and grain and a good supply of Timothy hay for them, although now I am raising some Alfalfa and clover by a liberal application of lime. I sowed a two-acre piece of the former early last August and it was spoken of by several men as the best piece they had ever seen, in spite of the extremely dry weather. I had Summer-fallowed up to the time of sowing to kill out the weeds, and the dry weather helped do a good job at that. I got after the last of them with a hoe to make the work complete.

I have used slings for several years unloading hay, and find them far superior to either double or single harpoon fork. I unload a ton or more with three sling loads, and scarcely enough hay left on the wagon to make a hen's nest. J. T. T. could use them with his 18-foot rick if his barn is high enough, so the bottom of the sling-load would not hit something, and can handle some fodder or grain in sheaf, and use them with an engine instead of horses by using a windlass. All of those things are done in this vicinity with complete success. My track is of steel and very satisfactory

Cattaraugus Co., N. Y. E. N. RYTHER.

RAISING MULES; BREEDING EWES.

1. What do you think of the plan of raising two mules a year from a pair of young mares instead of horses? The time necessary is shorter, the mules hardier and more valuable, I am told. In order not to interfere with the mares' farm work, what would be the best month to have them foal in? 2. At what age can an ewe lamb be bred? B. M.

1. The raising of mules is a line of endeavor that is very popular and profitable in New Jersey. Notably in the region of Philadelphia they are using mules more extensively than horses for the delivering of market gardening crops, the point being that they are better adapted for use on stone roads, and are especially useful in cultivating market gardening crops. It is true that mule colts are possibly more hardy than horse colts, and can be worked at a little younger age. If there is a suitable jack in the neighborhood there is no doubt that the inquirer might find this practice very satisfactory, and would no doubt get good results. There is surely a ready market for mule colts at the present time, and mares suitable for breeding mules can be selected from a greater variety of types than is possible in the breeding of horses. The popular demand appears to be at the present time for a mule weighing from 900 to 1,100 pounds, and there is less demand for the big sugar-loaf mule that was very popular a few years ago. Our best mules come from various regions in Kentucky and Tennessee, where they use misfit saddle mares for breeding purposes.

2. A ewe lamb can be bred in her yearling form, and will thus drop her first lamb when she is two years old. Ordinarily ewes do not come in use until after the first spell of cold weather, sometimes during September or October, at which time they may be mated. In case of Dorsets the ewes mate twice a year, and flushing with the other breeds has the effect of bringing them in use earlier, and in much better condition for settling. The period of gestation is 147 days.

F. C. MINKLER.

SPAN OF MULE COLTS.

SUCCESS WITH WINTER LAMBS.

Several farmers in Ross County, Ohio, and neighboring counties, are producing hothouse lambs. Most of us are discouraged over the present state of the business and some intend to quit. It is rather hard, however, for those who have the equipment to go into some other line of work. I have now three barns with combined floor space of 2,850 square feet, all concreted for sheep. There is almost that much more floor space for stables, feed rooms, etc. I have a 130-ton concrete block silo.

I keep about 200 ewes and last year had six extra fine Tunis rams. My ewes are Dorset-Delaine. I have been told many times that no better lambs than ours go to the New York market. I have received $14 for a good lamb and have sold many for $12.50 or $13 per head, but the average is nothing like that. Here are some averages. These are net as to commission and expressage, but not as to the production of the lambs:

	Lambs	Average.
1906-07	112	$8.09
1907-08	136	7.13
1908-09	155	8.97
1909-10	161	9.07
1910-11	180	7.84
1911-12	197	6.80
1912-13	148	7.68
1913-14	71 to Feb. 1	6.27

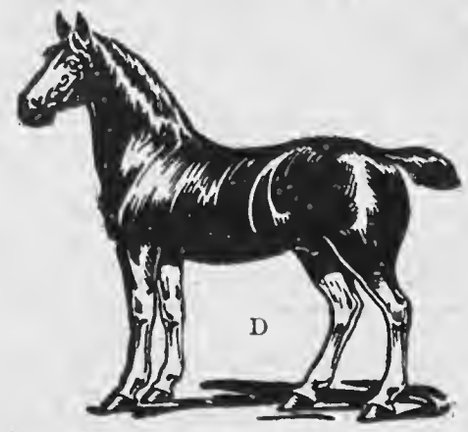
You will notice that in 1912-13 there were 148 lambs. That Spring the weather conditions were such that we could not dress lambs and had about 40 left on hand, which would of course further reduce the average. Our best sales have always been from just before Christmas until the middle of February, but this year our best sale was $9 each (gross), and from that down to $5, with an average of $6.27 for what I have received returns for (71).

Among 200 ewes there are always some that will not breed early, no matter how they are treated. This season we had 126 lambs dropped in October and November, three in December and

Make Your Lame Horse Sound, Like This

You Can Do It While He Works.

We want to show you that there isn't any affection that causes lameness in horses that can't be cured, no matter of how long standing. We want to send you our instructive book, "Horse Sense" No. 8.



It describes all. And with the book we want to send you an expert's diagnosis of your horse's lameness. All this is absolutely free. Simply mark the spot where swelling or lameness occurs on picture of horse, clip out and send to us telling how it affects the gait, how long animal has been lame and its age.

We absolutely guarantee Mack's $1,000 Spavin Remedy to cure Spavin, Bone or Bog Spavin, Curb, Splint, Ringbone, Thoroughpin, Sprung Knee, Shoe Boil, Wind Puff, Weak, Sprained and Ruptured Tendons, Sweeny, Shoulder or Hip Lameness and every form of lameness affecting the horse. We have deposited One Thousand Dollars in the bank to back up our guarantee. Cures while he works. No scars, no blemish, no loss of hair.

Your druggist will furnish you with Mack's $1,000 Spavin Remedy. If he hasn't it in stock, write us.

Price $5 per bottle, and worth it. Address McKallor Drug Co., Binghamton, N. Y.

Large Berkshires at Highwood
During each of the last five years we have sold more registered Berkshires, and this last year three times as many as any other breeder in the United States. Over one hundred sows, bred and open, for sale. Service boars, pigs all ages. Visitors always welcome, H. C. & H. B. HARPENDING, Dundee, New York

BERKSHIRES
We have a number of very fine boar pigs for sale at attractive prices. They are the height of breeding, type and quality. It will pay you to get our prices on these choice pigs before you buy elsewhere. Now is the time to put a fine sire at the head of your herd. Prices and descriptions sent upon request.
TOMPKINS FARM, - Lansdale, Pa.

ELLENWOOD FARM
BERKSHIRES
Pigs of both sexes and unrelated trios for sale. Our pigs are rich in Masterpiece, Lee and Premier blood. Let us furnish you with a foundation herd. Only choice animals sold for breeders.
Write us, or better yet, pay us a visit.
ELLENWOOD FARM, R. D. I., Hatboro, Pa.

If you want the best hog
Write us. Our farms are devoted exclusively to the production of Berkshires. Breeders in the following States have been supplied from our great herd: N. Y.; Penna.; Dist. Col.; Md.; Va.; N. C.; S. C.; Ga.; La.; Ala.; Miss.; Fla.; Tenn.; Ky.; Texas, and Porto Rico.
Berkshires for foundation and show purposes a specialty.
THE BLUE RIDGE BERKSHIRE FARMS, Asheville, N. C.

Handy Binder
JUST the thing for preserving files of The Rural New-Yorker. Durable and cheap. Sent postpaid for 25 cents.
The Rural New-Yorker
333 W. 30th St., New York City

40 in January. Of course these that are coming now are too late for best prices if there is any best this year. What is the trouble with prices? I do not know. It may be overproduction or lack of demand. It costs a good deal to produce these lambs. The ewes must be heavily fed and the lambs eat a surprising amount. My silo will hold 10 acres of corn, 75 bushels to the acre. We use all of it in a season. We feed Alfalfa, about an average of 35 tons, and the fodder from 15 acres of corn. This year I am feeding some dried brewers' grains, as our corn was poor. It would not make over 50 bushels per acre this year. We have added three tons, that I think will last us. Cost about $32.50 per ton delivered; one ton of oil meal, about $38.50 delivered, and probably a ton of bran at $26. The lambs also eat a good deal of shelled corn.

In this business and fed as the lambs are, one cannot afford to keep the ewe lambs, so we must in some way replenish our stock. Last Fall I bought 75 Western ewes at $4.60 per head and will let enough of the old ewes go to keep my 200. Some of the ewes are quite old. We have lost eight and one of our best rams had his neck broken fighting. It is an easy matter to give results of one good period that may seem very encouraging. It is another matter to get average results through a series of years. I do a large amount of work myself and I keep two men. We also grow hogs and market about 100 per year, but the hogs do not take the time the sheep do. If anyone has the equipment he may do very well in this business in a small way, but if one must build his barns and silo (and we feel the silo is almost indispensable) I would advise him to go very slow with the present very low prices.

There is much being said about the young men leaving the farm. One reason is because the farmer does not receive enough return for the cost of his equipment and his labor. Therefore he cannot afford to pay prices that will keep good farm labor on the farm. M. L. P.

Sweet Clover for Hog Pasture.

What do you think of sowing Sweet clover for hog pasture? I have one-half acre hog run, and am thinking of sowing it to oats and Sweet clover in the Spring, and then when the clover has a good start turn in some young shotes. The land is sand and gravel mixed. If the hogs keep it pastured down so it cannot go to seed will the clover remain there for next year, or must it be sown every year? W. T.

Elkhart, Ind.

You can hardly make a mistake in sowing Melilotus alba, the White Sweet clover, for hog pasture. We consider this plant one of the greatest pasture crops that we have ever seen. Last year we turned 56 head of 100-pound shotes on to an acre of Sweet clover, leaving them there six weeks, at which time they were ready for the market, and the Sweet clover had been eaten down only to within 12 or 15 inches of the ground. There is not much to tell about handling this crop. We use it just the same as Alfalfa, put it on the same kind of soil, which must be rich in lime and inoculated, although it need not be fertile. We prepare the same kind of seed bed and sow it the same time. We use hulled seed exclusively and whatever you do never cover Sweet clover seed deeply, just barely cover it at all, and you will get good results. Seeded April 1, you can expect some pasture or probably a hay crop the first year, the second year a very heavy hay crop, which must, however, be cut a foot high or it will kill the plants. Then following this, a seed crop of one or two bushels per acre and then the plant dies.

As a hay crop, Sweet clover compares favorably with Alfalfa, excepting that it is a good deal more woody. It must be cut when first coming into blossom. Let it lie in the swath for 24 to 48 hours, then shock it in small shocks, and leave it entirely alone for a week or 10 days. In that time it will probably be ready to go into the mow. The stock after once getting a taste for it, will eat it greedily. CHAS. B. WING.

Teacher: "Now, James, do you understand the meaning of the word 'extinct'?" James: "Yes'm." Teacher: "Then name one bird that is now extinct." James: "Chipper." Teacher: "Chipper? What kind of bird is that?" James: "My pet pigeon. The cat caught him this morning."—Judge.

A Vicar having advertised for an organist, received the following reply: "Dear Sir, I notice you have a vacancy for an organist and music teacher, either lady or gentleman. Having been both for several years I beg to offer you my services."—Credit Lost.

WANTED—SEVERAL Good Milk Goats—TAYLOR, Box 258 Harriman, Tenn.

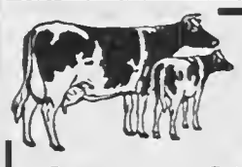
90 HEAD Purebred Holsteins
consisting of 50 Cows, 25 Heifers, 15 Calves and a few choice Bull Calves. Home of Ormsby Korndyke Lad. No. 102469. If you are in the market for Holsteins come to see me or write. My stock will please you. EZRA HOLBERT, Lake, Orange Co., New York



Purebred Registered
HOLSTEIN CATTLE
Last year a California Holstein made a yearly record of 784.13 pounds of fat from 25,981.8 pounds of milk.
After an interval of two months she began another yearly test which has just come to a close with a record of 868.1 pounds of butter fat from 28,826.4 pounds of milk.
These two successive yearly tests during which 54,800 pounds of milk were made are more evidence that great records are not spasmodic efforts, but represent capacity permanently developed.

Box 105 Brattleboro, Vt.

A Family Foundation
Consistent line breeding has developed at Meridale Farms four definite families of strong dairy type and exceptional producing ability, as is attested by the authenticated records of 117 Meridale Jerseys who averaged 7894 lbs. milk, 509 lbs. butter each on yearly test.
One of these families is the Saydas, and one of the best Saydas is Sayda's Queen of Ventnor 168033, who averaged 540 lbs. butter a year for ten consecutive years, and produced 11,433 lbs. milk, 809 lbs. butter when eleven years old. The average authenticated record of herself and two daughters is 740 lbs. butter each per year.
To other dairymen who are working for heavy and persistent production we offer a special selection consisting of two granddaughters of Sayada's Queen of Ventnor with a son of her full brother, Sayda's Heir 3rd. They are good individuals, backed by production through every line, and comprise a family foundation which enables their purchaser to profit by our quarter-century of herd-building experience—he begins where we leave off. Pedigrees and particulars gladly furnished on request.

THE SQUARE SILO.

Northeastern Ohio is thickly dotted with square silos. In this section 90 to the 100 are square, and of all the silos erected here the past season all but one are the girthed, square silos, and some of them are in connection with very costly barns. My own silo, built in 1886, is a square one, built after a design of my own; for, so far as I know, there was no other to pattern after, and it is still in existence, ready to be counted in next year, and that too without a dollar for repairing. They are very durable, never blow over or collapse, and are more cheaply built than the market silos. Another consideration is that the farmer usually supplies the rough and heavy lumber from his own wood lot, and purchases only the inside lining of the silo made of strong timber like oak or beech; it never gives way, the manholes are easily fitted with doors, and if made double, as many are, space is economized and additional strength imparted, and it cannot be shown that any other form or pattern of silo keeps its contents in better condition than does the square one.

In building the square silo, three principal things are needed: timbers, 2x8 or 10 inches by 14 feet long for the girths, which need to be enough in number for a girth each 16 inches up to the seventh girth, when the spaces can be widened a little, each succeeding girth, until the top ones can be three feet apart. No framing is needed, just lapped corners, well fastened with 20's. The ends are lapped as usual and spiked, and the long end of each girth becomes the other corner. Across this corner is spiked a short piece to each girth and it not only strengthens the corners, but makes a cut-off in ceiling inside, to avoid acute angles, into which the silage does not pack well. This corner clip is sometimes made a little convex, which facilitates making a better curve with the lining lumber.

The foundation should be made substantial, cement floor, with broken stone, and should be about 16 feet square for a 12x12 foot silo. The sills of the silo would best be two layers of these girths spiked together and after placing on the foundation, should be well cemented in place. Then cut 12 pieces of 2x8 inch stuff, 14 inches in length, and nail them to this sill at equal distances apart; on them lay the first girth, and spike down through it, to these short pieces, and so on up to the top, 30 feet being none too high, making rather wider spaces between the girths as the half-way height is passed.

Line up the inside walls of the silo with the best Georgia pitch pine flooring, free of sap. Get the three-inch widths. Lay it as well as you would a house floor, draw the grooves very close, and go on round until within 18 inches of where you begin. Cut in pieces, and nail between the girths for the door jambs, setting them so as to have a bearing all round for the door to rest against. Make doors of flooring that will fit the apertures, and reach from the center of one girth, to the one above, opening into the silo, of course.

The inch thickness of flooring is all you need for the inside. The silo is then covered on the outside with any sort of siding, put on up and down, and a few cracks should be left, so air can get into and dry out these spaces between the girths. The pitch pine lining will not take up moisture, and as fast as the silage is fed out, dries off quickly. The lining boards of my old silo, built 27 years ago, are sound yet and should a board go wrong, it can be quickly patched by putting a new one in its place. A new idea suggested is that these inside boards be matched but not surfaced, and after being put in place are "whitewashed" twice over with best Portland cement and very fine clean sand, half and half, which makes almost a "granite ware" surface, and can be cheaply renewed at any time. Some instead of boarding up the outside of the silo, put on liberal coats of this same paint filling all joints of the frame as well as the boarding.

The roof can be as one may elect. A roof is at best only valuable for looks, and to keep snow out of the silo. Rain never injures silage. The cost is a matter of local prices, and labor. Here the pine flooring would cost about $30, and all told it would probably not be much out of the way to place the cost of this 85-ton silo at about $115; much less if the farmer furnished the rough lumber at actual labor cost. JOHN GOULD.

SHIPPING CREAM.

It is often stated that hill farmers cannot compete with the farmers on rich land keeping dairy cows. The cost of the cow's keep is supposed to be greater where feed is usually less plentiful, and the distance from market makes the freight charges so high that they eat up much of the profit. Without doubt if whole milk were sold and cows were kept on dry feed, the hill farmer could not compete with more favored competitors. However, since the advent of the cream separator and the coming of the silo into general use, dairying is being taken up more and more by farmers situated far from market, and who up until this time could not profitably keep more than three or four cows.

The separator enables the dairyman to keep so many more cows and handle so much more milk, and the cream as the product for sale is in such shape that the freight charges are small compared to the value of the product. Cream can be carried a distance of 85 miles and reach its destination inside of five hours at a charge of only 12 cents per five-gallon can. Selling to a creamery for cash is much better than selling butter to the country stores for trade, and more and more farmers are increasing their number of cows, specializing in dairying, and consequently receiving larger cream checks as they improve their feeding and breeding operations. For the cream cow must be looked after both as to the kind of calves she raises and the amount and quality of feed she receives.

While some dairymen are losing sight of the fact that they must get for their cream and skim-milk combined, a price at least as good as, if not better, than that obtained by dairymen close to big cities, that is from 3½ to four cents per quart, still some are figuring very closely, and actually realize more than 16 cents per gallon for their entire product. A cow to be a good "cream shipper" must test at least 5% and of course high-grade Jerseys or Guernseys are the best for this purpose. With a test of 5% in a gallon of eight pounds of milk there is four tenths of a pound of butterfat, and at an average price of 30 cents per pound is worth 12 cents. Then if the skim-milk is worth four cents per gallon the amount realized out of the gallon of milk is 16 cents. As the cost of marketing the cream is small, much less than would be the cost of marketing the whole milk, the work necessary to feed and care for young stock properly can be charged as marketing expenses, and the full value of the milk as represented in the calves, hogs or chickens can be credited with the amount realized for the butterfat as the selling price of the whole milk. Counting feeds other than skim-milk that the young stock receives at cost, the skim-milk realizes when fed to heifer calves six and even eight cents per gallon. Brood sows as well as stock hogs show a net profit that, being credited to the skim-milk, gives it a selling price of from four to six cents per gallon. With proper management, and also with the keeping of purebred stock, skim-milk can be made very valuable as a feed, and while the side lines carried on in connection with the cows are in a way independent of the dairy, the cow and her milk are important factors in the work, and should be given credit for their part in making the various side lines a success.

An important part of the work of the cream shipper is to provide enough feed to keep up the full milk flow of the cows throughout the entire year. And here is where the silo comes in for due consideration. It is plain to anyone that silos are more necessary on hill farms lacking in fertility than they are in, say, the corn belt, where much of the corn is never cut, but the stalks are practically allowed to go to waste. And the higher up among the hills one goes and the scarcer rough feed becomes the more necessary it is for the farmer to have a silo. It has been proved over and over again that a few acres can be improved in but a few years, until they will fill a good-sized silo with enough silage corn to feed quite a number of cows; and as more cows are added to a herd more manure is produced for use on pasture and crop land, thus adding to the value of farms that would otherwise remain infertile and unproductive. At the same time that fertility is being added to the soil, a price is being obtained for the whole milk the cow produces, provided the right breed is kept and the by-products properly handled, that is as good if not better than that obtained by dairymen selling whole milk direct to the middleman. H. B. COBB.

Jackson Co., O.

AILING ANIMALS.

Pining Cow.

I have a cow which came in last month; since then she has not done very well, gives very little milk, looks unhappy and does not chew her cud. She looks in good condition. What can be done for her? B. P. L.

Ohio.

Have the cow tested with tuberculin, as tuberculosis is to be suspected, and we should not feel justified in prescribing treatment before the test has been applied. A. S. A.

Tumor.

I bought a Holstein bull calf several weeks ago. It is now about six weeks old, and has a lump on its left jaw that looks just like the pictures I sometimes see in advertisements of lump jaw remedies. It is the size of a guinea egg. Is it possible to get rid of this lump in any way? F. C. L.

Virginia.

Have the lump cut out by a surgeon and then cauterize the wound. This is the right treatment and if done in time may altogether prevent the threatening case of lumpy jaw. A. S. A.

Injured Ankle.

A horse hurt his front ankle, supposed to have stepped on a stone. Now there is a big bunch over his front hoof. What would you advise? J. P. R.

New York.

If you mean that there is a large, raw growth or sore it should be treated by covering with a mixture of equal parts of powdered alum, tannic acid and boric acid, cotton batting and bandages. Put the bandages on so as to cause pressure upon the sore. Renew the dressing once daily. A. S. A.

Depraved Appetite.

I have a cow that eats her manure sometimes; her milk is thin, not fit for use. Could you tell me the cause, and a remedy for it? She does not do so in the Summer, but in Winter we keep her in a very small place. L. C.

Delaware.

Keeping the cow in a very small place is wrong. She needs abundant exercise every day and an abundance of mixed feeds, including roots or silage, clover or Alfalfa hay, bran, cornmeal and cottonseed meal. Allow free access to rock salt. She will not be likely to eat manure if so fed and managed, but it would be well, so far as possible, to keep her from places where manure may be eaten. A. S. A.

Indigestion.

I bought three pigs a short time ago, were about eight weeks old when I got them. They had not been weaned and when I brought them home I began feeding them slop made of bran, cornmeal and shorts. Two of them are growing but the third does not care for anything but corn. When I feed them this pig just sticks its nose in the slop and runs from one end of the trough to the other end and squeals. These pigs are about 12 weeks old now. Can you tell me what is wrong with this pig? C. H. W.

Virginia.

Physic the pig with castor oil shaken up in milk and afterwards feed it on new milk or sweet skim-milk thickened with middlings, and a little cornmeal. Allow the pigs plenty of exercise every day. A. S. A.

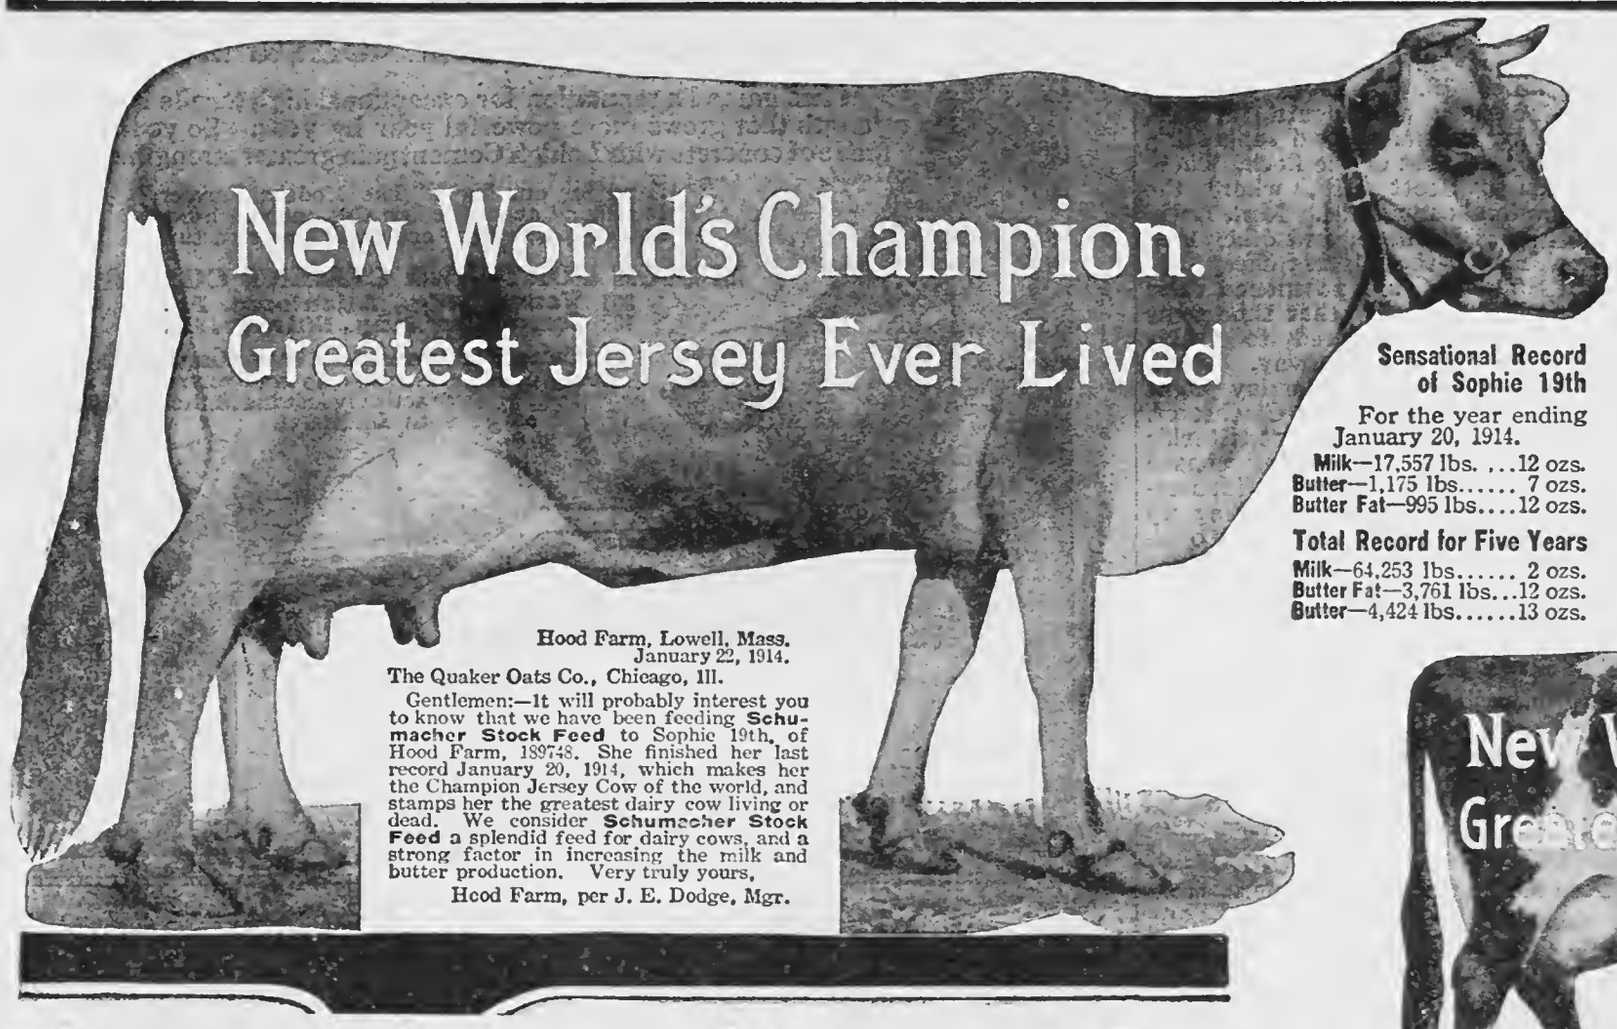
Chorea.

Would you please tell me how to treat a mare that has started with string-halt? A. Z.

Maryland.

The disease is chorea (St. Vitus' dance) rather than true string-halt, and it is incurable. It seems to be peculiar to nervous animals and the tendency to it is hereditary. String-halt, in which there is persistent jerking up of one or both hind legs during walking or trotting, most affects adult horses and is not associated with the nervousness of chorea. It may be brought on by accident, and often is curable by the operation known as peroneal tenotomy, for which an expert, graduate veterinarian has to be employed. The symptoms of chorea are best seen when an affected animal is made to stand over in the stall, or back out of the stall. At such times the leg is spasmodically jerked up and the tail is elevated and quivers and quivering also is seen in the muscles of the flanks. A. S. A.

Stop! Look! Read!



Hood Farm, Lowell, Mass.
January 22, 1914.

The Quaker Oats Co., Chicago, Ill.

Gentlemen:—It will probably interest you to know that we have been feeding **Schumacher Stock Feed** to Sophie 19th, of Hood Farm, 189748. She finished her last record January 20, 1914, which makes her the Champion Jersey Cow of the world, and stamps her the greatest dairy cow living or dead. We consider **Schumacher Stock Feed** a splendid feed for dairy cows, and a strong factor in increasing the milk and butter production. Very truly yours,

Hood Farm, per J. E. Dodge, Mgr.

Sensational Record of Sophie 19th

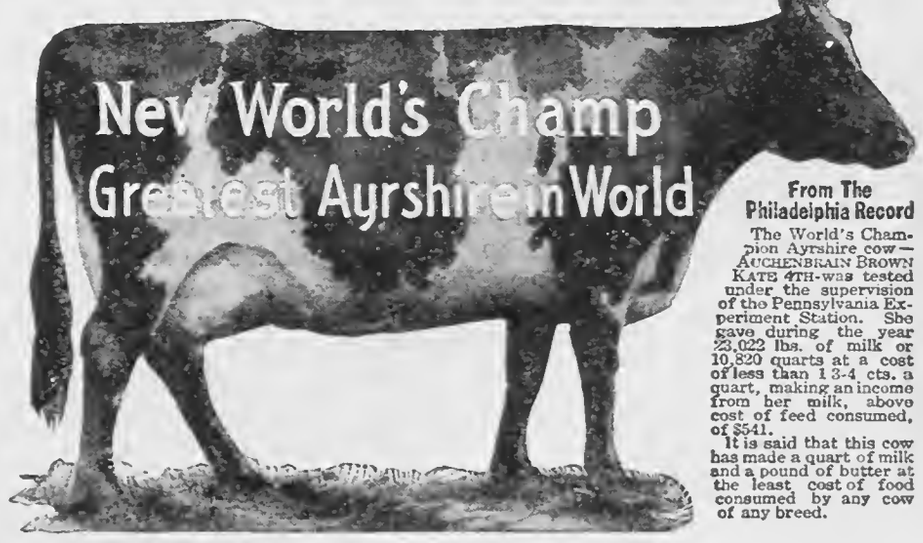
For the year ending January 20, 1914.

Milk—17,557 lbs. ...12 ozs.
Butter—1,175 lbs..... 7 ozs.
Butter Fat—995 lbs....12 ozs.

Total Record for Five Years

Milk—64,253 lbs..... 2 ozs.
Butter Fat—3,761 lbs...12 ozs.
Butter—4,424 lbs.....13 ozs.

FEED PROVES Greater Than BREED



From The Philadelphia Record

The World's Champion Ayrshire cow—AUCHENBRAIN BROWN KATE 4TH—was tested under the supervision of the Pennsylvania Experiment Station. She gave during the year 23,022 lbs. of milk or 10,820 quarts at a cost of less than 1 3-4 cts. a quart, making an income from her milk, above cost of feed consumed, of $541.

It is said that this cow has made a quart of milk and a pound of butter at the least cost of food consumed by any cow of any breed.

World's Records Smashed Again!

Many Breeds—BUT—All Fed One Feed!

Again and again, during the past year, the world has been astonished at the marvelous productions of milk and butter from single cows. Think of getting over 8¾ **tons** of milk and over ½ **ton** of butter from one cow **in one year.**

First one breed, then another, and still another have smashed all previous world's records, until in amazement we ask, "Is it possible," and "how can it be done?"

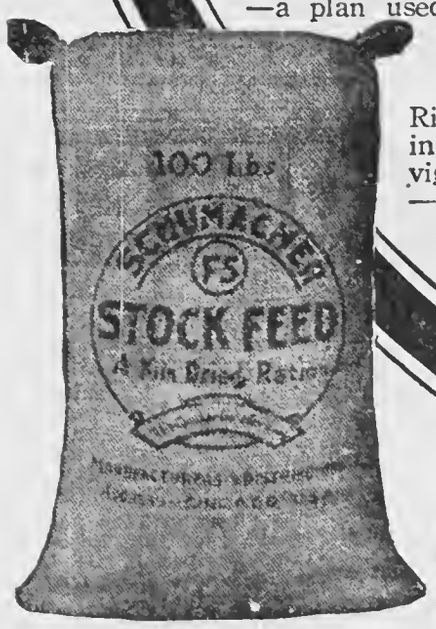
The answer no longer is "getting the right breed." Instead, "it's getting **the right feed**" and the right individual. Feed has **proved** greater than breed! This is **conclusively proved** by the fact, that regardless of the breed of these **"Queens of the Dairy World"**—be it Jersey, Holstein, or Ayrshire, which have "beaten" all records to date—they were all fed the same feed—the world famous, **record-making, record-breaking—**

Schumacher Feed

Therefore, we proudly—justly—proclaim that **"Feed—SCHUMACHER FEED—proves greater than breed."** Read the wonderful world's records just achieved by Sophie 19th of the Hood Jersey Farm, who finished her yearly test Jan. 20, 1914. Then read what Auchenbrain Brown Kate 4th, Queen of the Ayrshires accomplished—the cow which has the distinction of producing **more milk and butter at least cost of any cow in the world.** Then read the record of the first cow in the world to produce 40 pounds of butter in a week—Valdessa Scott 2nd. Then read the record of the second 40 lb. cow and note that all these remarkable, sensational performances were made with **SCHUMACHER FEED** as a base of their rations. Read their owners' letters. It needs no further evidence to convince anyone that **SCHUMACHER FEED** is the "best in the world." If it is "best" for the "best cows in the world" it certainly is **best** for your cows.

Try This Record-Breaking Feeding Plan

—a plan used by the World's Record makers, and you will be surprised at the results: Mix three parts **SCHUMACHER** with one part of any good high protein concentrate you are now feeding, such as Gluten, Cottonseed Meal, Distillers' Grains, Oil Meal, Malt Sprouts or Blue Ribbon Dairy Feed. Your cows will not only show a **splendid increase** in flow but in due time will show a **splendid improvement** in health, vigor and appearance. **SCHUMACHER** furnishes that stamina—vitality—ability—to stand up under heavy milk production, so necessary in profit-producing dairy cows.



FREE FEEDING FACTS If interested, write us for "Feeding Facts" and get some information worth hundreds of dollars to any dairyman or farmer.

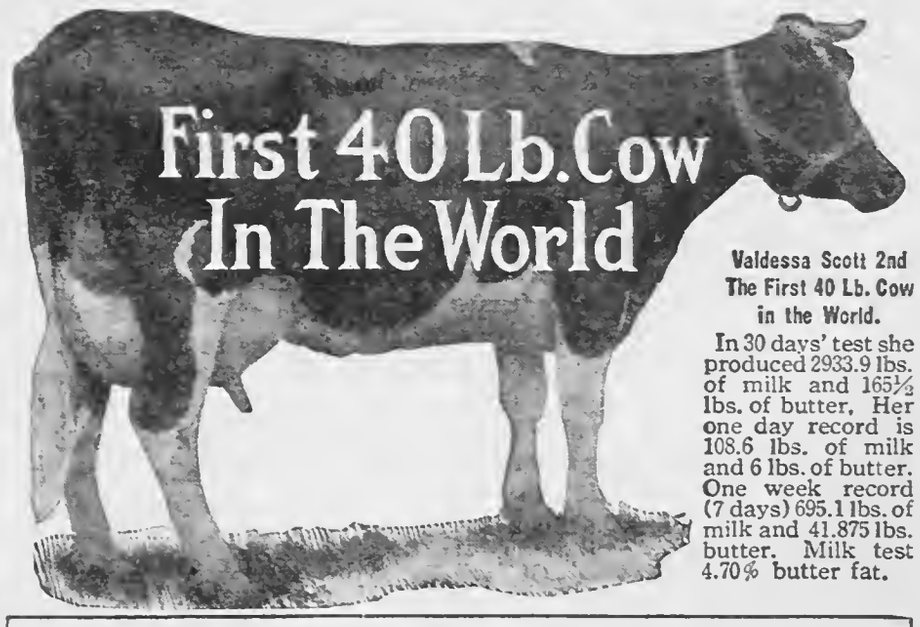
If your dealer does not sell SCHUMACHER write us.

Narberth, Pa., December 6, 1913

The Quaker Oats Company, Chicago, Ill.,

Gentlemen;---We have been feeding your **Schumacher Stock Feed** to our Ayrshire and Jersey cows which are on test for Official Records, and like it mixed with other grains. Our World's Champion Ayrshire Cow, AUCHENBRAIN BROWN KATE 4TH, who has just finished her year's work with a record of 23,022 lbs. milk and 1080 lbs. of butter, was fed **Schumacher Stock Feed** as part of her ration. We find that **Schumacher Stock Feed** is one of the best feeds we have ever used in our mixtures. Yours very truly,

(Signed) E. S. Deubler, Superintendent, PENSHURST FARM.



Valdessa Scott 2nd
The First 40 Lb. Cow in the World.

In 30 days' test she produced 2933.9 lbs. of milk and 165½ lbs. of butter. Her one day record is 108.6 lbs. of milk and 6 lbs. of butter. One week record (7 days) 695.1 lbs. of milk and 41.875 lbs. butter. Milk test 4.70% butter fat.

Finderne Stock Farm, Finderne, N. J.

The Quaker Oats Co., Chicago, Ill.

Gentlemen:—During the past two or three years we have been feeding your **Schumacher Feed** and have secured splendid results. **Schumacher** was incorporated in the ration of Valdessa Scott 2nd during her wonderful result producing test. Used as a base with a good protein concentrate it is a winner.

Yours truly, B. Meyer, Owner.

JOHANNA DEKOL VAN BEERS

The Second 40-lb. Cow—and her smashing 60, 90 and 100 day tests:

60 days, milk 5,552.00 lbs., butter, 290.00 lbs.; 90 days, milk 8,147.90 lbs., butter 418.13 lbs.; 100 days, milk 8,987.40 lbs., butter 460.19 lbs.; 120 days, milk 10,490.00 lbs., butter 540.97 lbs.; **7 day Record**, milk 663.00 lbs., butter 40.32 lbs.

THE QUAKER OATS COMPANY,

Dept. 12 CHICAGO, U. S. A.

[25]

Brookline Farm, Dec. 8, 1913.

The Quaker Oats Co. Chicago, Ill.

Regarding **Schumacher Stock Feed,** will say as a feed for dairy cows or young cattle, I know of no feed equal to **Schumacher.** It certainly contains all the ingredients necessary to put the finish and gloss on an animal and more than that, the results obtained through the pail makes it the cheapest feed that I have ever fed. Johanna, in fact all my cows are fed every day a ration of **Schumacher Feed.** To any one feeding cattle for show, I would especially recommend **Schumacher.**

Yours truly, T. E. Getzelman, Prop., Hampshire, Ill.

HOGS ON A SMALL FARM.

I will give you my experience keeping hogs on a small farm in a small way for the last two years. I would certainly keep more hogs on a large farm, but perhaps a small lot well cared for might make more profit than larger lots. On April 25, 1912, I bought a sow with eight pigs about three weeks old for $28. The sow and pigs were thin, as the owner was overstocked, and had to buy his feed at a high price. This was the reason he sold them. I kept this sow and pigs mostly on grass and slop during the Spring and Summer. I fed some corn but not much. I had to buy it, and it was high. It cost me $1 per 100 pounds ear corn. It paid to feed a little corn, as the pigs thrived well. From about August on we fed some early green sweet-corn, and later, when it got fit, field corn. I fattened the whole lot, as the old sow would not breed again. In the latter part of December we butchered the old sow and three of the pigs. We estimated their weight at between 1,000 to 1,100 pounds. On January 11, 1913, I sold the remaining five head for $86.14. Now if I figure that these last five paid the first cost of $28 and the corn and feed the bunch ate, we would have at least $75 worth of hogs for our meat. I do not believe that this lot ate $58.14 worth of feed, and if they did it was a good investment.

In January 17, 1913, we bought five pigs for $17. On April 11 we bought five more (shotes) for $35. These two lots made a pretty even bunch of about 80 pounds weight. We fed them along gradually corn on grass and slop twice a day. We never fed very heavily at any time. On August 11 we sold eight of them for $136.80. The other two we bred. If we figure these two at the same price the others brought the bunch would have yielded $171. Figuring the corn they ate at 70 cents per bushel (which was more than it was worth at the time, as we sold some corn the latter part of May at 56 cents per bushel) and the other feed they ate at market prices, they would have netted us $65 for our work; if we had sold the two sows at farrowing time at about the same price, $80, which my brother paid for two sows of about the same weight and same number of pigs, our income would have been $45 more. As it is we have the two sows bred again and 13 nice pigs and one runt. One pig of the lot we had to kill on account of an incurable ailmen.

These pigs we are now giving good care to turn off next Summer. They get corn twice a day and slop three times a day of a mixture of ear corn and oats ground together with tankage. Each mess is scalded with hot water. It is made fresh every meal. I am also boiling some small potatoes and overgrown turnips together, and adding it to the slop. Whether or not there is much food value in the potatoes and turnips, the pigs certainly relish them. When these pigs go on grass we shall only give them slop twice a day.

So far I have said nothing about the value of the grass eaten. Practically if not used by the hogs it would be valueless. The hog lot consists of about an acre or an acre and a half; one half of it is a pond, the remainder low land, unfit for cultivation. In this way we make use of the waste places. On August 16 we also bought a sow and three pigs for our pork. The sow has already been butchered and the three shotes will be butchered later. S. H.

Huron Co., Ohio.

Shot Guns and Thieves and Sheep.

There seems to be a difference of opinion on the subject of the treatment of thieves. I have a stray suspicion the Hope Farm man does not love or admire a hen as much as he does some things. Suppose now he should see a thief lugging off a barrel of his best apples, say the very best barrel; I mistrust he would feel like defending his property, perhaps not killing the thief, but if he refused to drop the apples a few shot might bring him to his senses. You see some of us do not keep dogs. Our experience with them has not been pleasant; in our own case, some years ago we had a nice flock of 28 sheep and lambs, and when my husband went out one morning, he saw two dogs making off over the fields, and the sheep scattered over the farm. One had gone a mile and a half to a neighbors. More than half were badly bitten; three killed outright, several so badly hurt they had to be killed to put them out of their misery. Trying to save some of the wounded ones who had to be treated for weeks was not an agreeable task, as I know from experience. Now note the enclosed clipping from the Connecticut Courant:

Bozrah, Dec. 15.—Elijah Lathrop, who has a farm near Garner Lake, is realizing how difficult it is to keep sheep. In the early Summer he had a fine flock, numbering about 70. Dogs got into the flock and killed 19. A week ago last Saturday the flock was again invaded, the dogs killing a number and separating about 17 from the rest of the flock. These they chased to Scott Hill, where the frightened animals remained. Mrs. Lathrop's son, James Lathrop, and other men were searching for the missing sheep, but because of Sunday's rain postponed their search until Monday. By that time some of the sheep had wandered to Cedar Swamp, a mile and a half away. When the search was resumed Monday eight were found at Parkham, near Colchester, one on Chestnut Hill, one at Stark's farm, Lebanon; two were being chased by two foxhounds near Oscar Winchester's in Bozrah, and five were missing up to Friday night. Of Mr. Lathrop's original flock only about 17 are left and not in good condition, as some of these rounded up were so badly bitten as to be useless.

I think some of us will depend upon a shotgun instead of dogs to defend our property. L. M.

The Value of a Dog.

Recently in Sauk County, Wisconsin, six big wagon-loads of two kinds of grain were stolen from five farmers, from one of them on two different occasions. I use this text to write a little dog story, because I agree with the editor in s estimate of the value of a well-bred and trained Airedale. No one would have shed any tears if either of the farmers had filled one or more of the thieves with buck-shot, but it is easier to keep a good dog than to get out of a shooting scrape, no matter how well the victim deserves all he gets.

Upon inquiry, H. W. Savage, one of the men who lost the grain, and whose farm was visited at the dead of night on two different occasions within 13 days, says that he kept no dogs, but is keeping them now. Only one of the other four grain-losers kept dogs, and he kept them too well by allowing them to stay in the house at night, so that all of these men who lost three loads of corn and as much rye were without canine sentinels day and night. The thief or thieves hooked up their team within 12 rods of Mr. Savage's barn and made, Mr. Savage thinks, about 40 trips between the corn crib and the wagon without creating an alarm. Does anyone imagine that such a thing could have been accomplished while there was a good Airedale about the place? J. L. GRAFF.

"WHY are you so angry with the doctor?" asked Mr. White of his wife. "Because," she replied, "when I told him I had a terribly tired feeling he told me to show my tongue."—Lippincott's.

THE Irishman in France had been challenged to a duel. "Sure," he cried, "we'll foight wid shillalahs." "That won't do," said his second. "As the challenged party, you have the right to choose the arms, but chivalry demands that you should decide upon a weapon with which Frenchmen are familiar." "Is that so, indade?" returned the generous Irishman. "Then we'll foight it out wid guillotines."—The Argonaut.

How to know concrete

Find out the quality of materials that go into its make-up. Clean sharp sand, gravel and water are usually alike. The only other ingredient used—*cement*—is the thing that determines good concrete. Secure the right cement—high in tensile strength—and you are sure of securing right concrete work.

Such a cement is—

LEHIGH PORTLAND CEMENT

It has gained a reputation for exceptional high tensile strength—a strength that grows more powerful year by year. So your buildings made of concrete with Lehigh Cement gain greater strength each year.

Send for our book, "The Modern Farmer." It tells all about Lehigh Cement and how to build a concrete silo and other farm structures.

LEHIGH PORTLAND CEMENT COMPANY
201 Young Bldg., Allentown, Pa.
102 Consumers Bldg., Chicago, Ill.

Concrete watering troughs won't leak, rust, decay or rot. There is no cost for repairs and they practically last indefinitely. Build yours with LEHIGH.

GET MY 1914 SPECIAL OFFER

On the New Galloway Sanitary, Bath-In-Oil Cream Separator
Just Fill In Coupon

Yes sir! You can't afford to purchase any other style or make of cream separator until you have first investigated my new Special 1914 Offer. Write me today for my catalog and I will mail you details of my offer. The new Galloway Sanitary is absolutely the most modern, most sanitary and closest skimming cream separator on the market, regardless of price. Now, that's a strong statement! Alright, here's my way of proving it. I'll send you any one of my three sizes of separators and let you try it 30—60 or 90 days on your own farm. I want you to try it out any way you can think of; compare it point for point with any other machine you know of, no matter what the price. Put them right side by side and test them. Then if you are not satisfied the New Galloway Sanitary is the machine you want, you can return it and I'll refund your money and pay the freight both ways. That's my offer in a nutshell.

Buy Direct from the Actual Manufacturer. Save $35 to $50
When you buy on my direct from factory plan you save all middlemen's profits. You get a high quality superior machine, equal to any machine on the market today and you save easily $35 to $50. Give me a chance to prove my claims. Let me show you just what the New Galloway Sanitary, Bath-In-Oil Cream Separator is like. Get my new catalog. Just mail free coupon.

FREE My New Dairy Cow Book
When you write for my catalog, I'll send you free coupon for my valuable "Cow Book." Regular price $1.25 but free to any man who wants to make more money out of his cows. This book is a regular dairying manual and is worth hundreds of dollars to any man following its common sense suggestions. You can get a copy free by just writing today for my catalog and special offer. Fill in, cut out and mail coupon or write me a postal.

Winter Dairying Pays.

"That check makes me feel cheap," a farmer remarked a few days ago, as he received his milk check. He passed it over to me. It didn't seem to feel as good as a check might in one's hands. I observed the amount, only $30. This farmer was receiving $1.70 for his December milk, had over 20 cows, and they had fizzled out when he ought to have been getting his good checks. This kind of business doesn't pay. Get a Winter dairy. It will pay in a great many sections. In this farmer's location, Summer milk this past season brought $1.05 net, while the Winter prices for five months have been established at $1.70 net. The quickest way to get the dairy out of the boarder class is to make them serve when milk brings the best price, and the cost of labor is lower than in any other season.

Had these cows been giving only 25 pounds the day each, the returns would have reached over $250 the month. At Summer prices the returns would have been about $157 the month. Now, good sensible business farmers declare that a cow which will yield only 3,000 pounds milk during the season following Spring freshening, will do 4,000 pounds by freshening in the Fall. Conditions must be right for her to do this. I know several dairymen who declare milk can be produced more economically in Winter than in Summer. Winter milk demands silage and concentrates, and a silo will pay whether you feed beef cattle or sheep or even horses or hogs. In the Winter the cow is not bothered by fighting flies, and in a comfortable well-ventilated barn she is more comfortable than rummaging about a dried-up pasture. When pressure is highest on the farm the Winter dairy lightens the Summer work. The farmer will have more time to give attention to his cows, more carefully feed, weigh and test the cows, and get on the way to better stock. I know a farm with large up-to-date bank barn, beautiful large house, good stock, equipment and fences, and these buildings have been established, the farm paid for by Winter dairying and the owner is still young. The Winter dairy pays. W. J.

Fresh Air Will Cut Down Feed Bills.

Ventilate the barn. That advice is easy to give, but mighty few give the matter consideration it deserves. I know we have not, and we are no better or worse than many others. Did you ever go in a barn and find the air hot and suffocating? All the oxygen is burned out, and the foul air is breathed over and over again. Did you ever notice how weak the cows are when they leave the barn? One believes more cows have been put on the lift through poor ventilation than through a one-sided ration. On the other hand there are barns that have too liberal ventilation. But in buying a cow a good dairyman told me he would rather buy from a barn with doors from their hinges, and boards from the sides than buy from an unventilated and unlighted barn.

Ventilation is more important than feed. Give the calves the benefit of good fresh air and they will thrive better. Regardless of your views of the tuberculosis proposition, take out an insurance policy against the danger by figuring out an outlet for the warm air above the cattle and an inlet, which will break the draft. If you have windows in the barn, the plan is to tip the window outward, leaving an opening of a few inches at the top. The V-shaped opening on the sides of the window should be closed by nailing boards at the sides to prevent inward draft, while warm air from the inside will pass up and out over the window. This advice is simple, then give the stock more air, and it will Winter better, and will produce enough more to pay for the installation of a good ventilating system next year. W. J.

A Homemade Fireless Cooker.

The advantages and the profit of cooking feed for swine, calves and poultry are well-known, and it would be practiced much more extensively if it were not for the extra labor and expense involved. Both of these items can be very largely done away with by the use of a homemade fireless cooker, which can be easily made. It is in fact simply an adaptation of the "straw-stove" so long used in Northern Europe.

Procure a large packing box, three or four feet square and a galvanized iron garbage pail, holding from five to 20 gallons, as may be needed for the amount to be cooked. If necessary a box can be made from odd pieces of board. It should be large enough so that from eight to 12 inches of straw can be put beneath and around the can. Set the can in the box and pack soft straw or hay on all sides solidly; then fill two bags with the same to put over the can after it is filled. If roots, such as beets, carrots, turnips or potatoes are to be cooked they should be cut into small pieces. This can be easily done by putting them in a box and chopping them down with a spade or other convenient implement. Then back into the can or a kettle, and cover with hot water and bring to a boil either on a stove or in a feed cooker. Put into the fireless cooker at once, cover with the bags and let stand 12 to 24 hours. This will cook them thoroughly without any further use of fuel or any attention. Enough can be cooked at one time to last several days if the cooker is large enough.

For poultry, especially ducks and chickens, it is very desirable to cook the grain. It is easily done in this cooker, and should be practiced by all careful feeders. Oats, barley, wheat or corn can be used. Use one part of grain and five parts of water, bring to a boil on the stove and then put in the fireless for 12 to 24 hours. The grain will absorb the water and give a large bulk of most nourishing feed. For ducks feed the roots chopped fine and the grain in a large pan of water, and let them fish them out in their natural way of getting their food. This fireless method of cooking any food for stock or poultry is well worth a trial. S. J.

MISTRESS: "Bridget, the pie is awful. And you told me you could bake as good pies as any cook in Boston." Bridget: "So I can, mum. But all the ladies I ever worked for mixed the pies themselves before I baked 'em, mum."—Boston Transcript.

Molassine Meal
MADE IN ENGLAND

A Perfect Feed for **Your Team and Farm Horses**

It is not only the value of Molassine Meal in itself but its digestive and antiseptic properties that lend great additional value to the rest of the ration used.

Feed three quarts per day to each horse in place of the same quantity of other fodder. In a few weeks you see improved results in increased strength and glossy coats.

AMERICAN ICE COMPANY
WASHINGTON, D. C.

When your salesman called on me, some months ago, I very reluctantly agreed to try out Molassine Meal on five horses from four of our stables—20 HORSES IN ALL. These were young, green horses, NOT IN GOOD CONDITION.

In less than four weeks they showed most surprising improvement, gained from 40 to 65 lbs. each, and are now working regularly every day.

I cannot say anything too good about Molassine Meal.

Yours very truly,
GEO. A. LOVELESS,
Supt. of Stables.

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates

Ration for Cows.

Give me a balaneed ration for my cows, am making butter; cows mostly Jerseys. How much to feed each cow? I have good eorn silage cut when about ready to shock, ear eorn and oats ground together; shredded dry fodder, elover and Timothy hay; can buy oil meal at $34; cotton-seed meal at $30; Alfalfa meal, $32. A. R.

Ohio.

If you have plenty of silage I would reeommend feeding 30 to 35 pounds per cow daily. If the supply is limited it will be well to decrease the amount, so as to make the silage last till Spring. The same rules will apply to the shredded fodder and hay. Dry fodder should be fed according to the eow's appetite rather than by weight, all she will eat without waste. If you mix equal parts by weight of your corn and oat feed and eottonseed meal you will have a very good mixture for milk produetion. A cow giving 20 pounds of milk daily should have about six pounds of this feed, and more or less according to the amount of milk. I think the best way to feed grain is scattered over the silage. If one has some rather unpalatable roughage, as straw, over-ripe hay, the eows will eat it mueh more readily if the silage is put on the hay, or straw, and the grain on the silage. I suppose this is on the plan of peaches with bread and butter. At any rate, the cows like it better that way. C. L. M.

Bean Meal for Cattle.

Will you give me formula for mixing the common bean ground to meal with corn, bran, oats or rye, or any part of this that would make up something like a balaneed ration for young cattle, also for mileh cows, and the best way of preparing for hogs? I have about 50 bushels table beans that are hardly fit for food, weevily old crop, that I wish to feed to my stoek. D. B. C.

Virginia.

Beans are very rich in protein, besides containing a fair amount of carbohydrates. However, they are not partieularly relished by stock, except sheep. If ground and mixed with other grain, however, they will readily be eaten. If the bean meal comprises about one-third of the ration with any of the grains you mention the proportion will be about right. For milch cows equal parts of bean meal, corn or rye meal and bran will be good, and this same mixture will do very well for young cattle. For pigs equal parts of beans, corn and rye, ground together and made into a slop will give good results. C. L. M.

Dairy Ration.

Would you give balaneed ration for mileh eows? I have Timothy hay and shredded fodder, have all mill feed to buy. I have an opportunity to buy 1½ tons rye flour at $1.40 a hundred. Would it pay to buy it and mix with other feed? Other feeds are middlings $1.50, oil meal $2, suerene $1.40, bran $1.30, mixed feed $1.70 and $1.60 per hundred. The rye flour is treated with palum (?) oil at the tin mill. Is this harmful? W. H. S.

West Virginia.

I would advise you not to touch the rye flour for the purpose of eow feed, as the ehanees are that you would not get satisfaetory results from its use. I have never used "palum" (palm?) oil so can not advise in regard to it. I would mueh prefer to use the mixed feed or you could make a home mixture of two parts eornmeal, two parts eottenseed meal, and four parts dried brewers' or distillers' grains. Your cows should also have some succulenee, such as mangels, dried beet pulp or silage. If you could get some Alfalfa or clover hay to substitute for the Timothy hay you are feeding you would get much better results. C. S. G.

Boiled Beans for Cows.

On page 118 M. C. K. asks about feeding beans to cows. I have had considerable experience in past years, feeding beans to dairy cows. I began feeding ground beans, but found that only a very limited quantity could be fed without injuriously overloading the bowels. I then experimented with boiled beans. I found boiled beans perfeetly safe to use in any quantity, and the best milk produeer I ever fed. When cooking the beans I used a boiler that would hold 50 gallons or more. I put a perforated plate in bottom of boiler to hold beans from direct contaet with bottom of boiler, as they are likely to stiek to bottom and burn. I cooked enough at one time to last several days, and if care is taken when using to remove beans only from surface each time and not dig down so as to allow air to get to those below they will not sour readily, and a bateh can be made to last several days. I found most practieal way to eook as follows: Put the quantity for a bateh into boiler (I used a round-bottom, cast iron kettle) and put in water, about what I thought the beans would absorb. Make a light fire, just enough to warm the water and let the beans soak two or more hours, then increase the fire to cook slowly several hours, watching the kettle and adding water if needed to keep from getting too dry. When done well the beans should not be stewed to pieces, nor have mueh water unabsorbed. About in same condition you would want them served on table for yourself. Salt may be used to season, but do not put it into kettle until beans are nearly eooked, as it makes beans harder to eook. I have used many hundred bushels of beans, damaged beans, bean piekings, etc., and when I could get a fairly good artiele, I considered it eeonomieal. I consider cooked beans the safest grain ration that can be fed eows, and the best for milk produetion. They may be fed in almost unlimited quantity if well cooked, without injurious effects. MONROE MORSE.

Massaehusetts.

A Horse Ration

I would like to know what to feed a 15-year-old horse. He travels about 10 miles every day half up hill and half down, also has to work on farm, though not often. I have wheat bran, oats, whole corn, cornmeal, gluten and oil meal on hand. W. S., JR.

New York.

For a young horse doing rather light work I would reeommend two parts oats and one part whole eorn. For an oldish horse ground feed is generally preferable, and in your ease probably a mixture of four parts ground oats, two parts cornmeal and one part oil meal would be about the proper thing. One quart of grain per hundred pounds of horse daily, should be suffieient, unless you are hauling very heavy loads. At any rate, feed enough to keep the horse in good condition. C. L. M.

Ration for Young Stock.

I have 12 grade Holstein heifers, coming two years old, all due to freshen in about three months, also some last Spring calves. They are nicely housed, have hay and eorn-stalks, no beets or Alfalfa. The eornstalks are shredded and given to them with hay for roughage. What would be a proper ration for them, how mixed and what quantity fed to each, so as to keep them in good growing condition, and benefieial, looking to their development? Q.

A very good grain ration would be two parts by weight of ground oats and wheat bran, and one part oil meal. Give the heifers four pounds daily of the mixture, and the ealves two to three pounds, according to size. If ground oats are not obtainable corn may be substituted, though oats are preferable. As to roughage, give all they will eat reasonably clean. C. L. M.

Clover Cutters.

Can you suggest a good reliable cutter for cutting grass, clover and beet tops, for young ehiekens? I want one that will cut, not mash the clover. H. W. R.

Oxford, N. Y.

Any fodder eutter that ean be set to cut into suffieiently short lengths may be used for this purpose. An inverted lawn mower with a crank fastened to one drive-wheel has been used satisfactorily, I believe. Clover cutters for poultrymen can be obtained through any hardware dealer. M. B. D.

Knife Grinders
Binder Twine

THIS year ten disk harrows will be sold where one was sold five years ago. Why? Because so many farmers have learned that the proper use of a disk harrow is the best guarantee of a successful crop.

Proper use of a disk harrow means the purchase of an I H C disk harrow because they are the ones built to do the best work. The frames are strong, to stand the strain of following the binder or of slicing meadows. The set levers keep the gangs to their work at even depth. The bearings are the most durable that can be put on a disk harrow.

The full line includes disk, peg tooth, and smoothing harrows, drills and cultivators. See this line before you buy. We send catalogues on request.

"The Disk Harrow," a book which illustrates and explains the proper preparation of a seed bed, and gives examples of the value of disking—32 pages of valuable information—is yours for four cents to cover postage and packing.

$1.00 Puts It On Your Farm

Manson Campbell

For $1.00, I Clean and Grade Your Seed Grain

THE CHATHAM Grain Grader and Cleaner

Handles 70 Kinds of Seed Grain and Grass Seed

From Wheat, it takes Wild Oats, Tame Oats, Cockle, Rye and Smut.

Cleans the dirttest Flax. Has special knocker and skimmer which prevents clogging. (Other machines choke up.)

Takes Dodder, Barn Yard Grass and Foxtail out of Alfalfa and Millet "slick as a whistle."

Takes Buckhorn from Clover.

Sorts Corn for Drop Planter.

Famous BEAN MILL. Handles all varieties, takes out the SPLITS, Clay, Straw, etc.

Handles Peas as well as any Grain or Grass Seed. Removes foul weed seed and all shrunken, cracked and sickly grains. Takes out all dirt, dust and chaff. It is also a bully chaffer. Handles 60 bushels per hour. Gas power or hand power. Fastest running mill.

You can't afford to plant common Seed (and take chances on a poor crop, when I am offering to scientifically clean and grade every bushel of your Seed Grain for this spring's planting for one paltry dollar.

Here's my proposition, and if you are a smart man you will write me before sunrise tomorrow:

Send me one dollar and I will ship you, FREIGHT PAID by MYSELF, this improved 1914 Chatham Grain Grader and Cleaner, with all equipment. Clean your Seed Wheat, Oats, Flax, Barley, Peas, Beans, Corn, Grass Seed, etc. Then PLANT those fine seed. AFTER you have harvested a bumper crop, pay me the balance of my low price. Not one penny need you pay, except the $1, until next October. And by October YOUR CHATHAM WILL HAVE MORE THAN PAID ITS ENTIRE COST IN INCREASED CROPS. Then you'll have it to work FREE for you the rest of your life.

Your Dollar Returned

I only want the dollar as evidence of good faith—to protect myself from mischievous boys. If after 30 days' hard test, you don't want my "Chatham," send it back at my expense and I will return the dollar.

A "Made-to-Order" Machine

Every "Chatham" is practically a *made-to-order* machine, for I send you the exact and proper Screens, Riddles, Hurdles and Sieves to grade and clean every *Grain and Grass Seed grown in your locality*. That's the secret of my success. I would not be the leading maker of Graders and Cleaners if I had tried to make my equipment fit ten million farms. What would you think of a clothing maker whose suits were all one size? Wouldn't it be a *miracle* if he gave you a fit. Yet all makers of Graders and Cleaners, except me, send the same equipment, whether you live in Maine, Ohio or Oregon. They wouldn't do that, if they had my 41 years' experience.

Extra Screens Free

I use, all together, 81 Screens and Sieves. It usually requires 15 to 17 for the average farm. These I select from the 81. After 41 years in the business, I am pretty sure to pick the exact equipment needed on your farm. If I shouldn't, just drop me a line and I'll send your additional requirements. There will be no charge for this.

Samples Graded Free

Maybe you have some Seed Grain that you can't clean or grade or separate. Send me a sample. I will purify it and tell you how you can do it cheaply. No charge for this.

Seed Corn Sorted

My big Corn Sorting Attachment, invented 2 years ago, is a great success. Twelve thousand farmers and many leading Agricultural Colleges are using it. It is the only machine I know of which scientifically sorts seed corn for drop planters.

New Book Ready

Send me no money now—just a Postal, for the finest, most complete Book on Seed Selection I've ever written. After the Book comes, write me what size machine you want and I'll ship it, freight prepaid, on receipt of $1.00. Then clean and grade all your Seed Grain. If you write today, you get my Book by return mail. Address nearest office.

WE are in a position to help you with your poultry. The best poultry writers in the country are ready to answer your questions, and will direct you step by step in the development and care of your flock. Through their help you may become an expert yourself, if you will follow their suggestions and take up a line of reading in connection with your practical work in the henyard. This service is free to all subscribers and their families. Make frequent use of it, and begin at any time.

Kitchen Waste for Poultry.

From June to November I can secure the waste from a large kitchen, enough to partially feed a large flock of poultry. This would consist of the usual leavings around a large house, and consist of bits of meat, bread, cereal, vegetables, fruit, etc. Would this be suitable to feed poultry? If so, how feed, and should I balance it with a grain ration? S. E. S.

Massachusetts.

Table refuse makes a very good feed for a flock of fowls when saved separately for that purpose, and when fed properly with other feed in order to make a complete ration. Of course it must always be fed fresh. Probably the best way to feed this refuse is to mix it into a moist mash with the addition of a small amount of dry mash to take up the extra moisture, which is usually used to soak the dry bread among the refuse. This mash mixture should then be fed either at noon or at night during the period of time you mention, and can be fed to advantage to both old and young fowls. Whole grain, such as cracked corn, wheat and oats should be fed twice a day besides this mash and grit, charcoal and oyster shell must be kept by them at all times. If there is not enough meat in the table refuse a sufficient quantity of ground beef scrap should be added to produce the desired results. C. S. G.

Concrete Henhouse Floors.

Our experience with concrete as a floor for chicken houses has been more satisfactory than that of Irving C. Lewis, page 22. We have two small houses floored with concrete slabs, which have been in use for two years, and instead of wearing out the chickens' toenails. I should say they are longer in Winter than in Summer, when they do more digging in the ground outside. We do not use an extraordinary amount of litter, usually about four inches deep and they reach the floor quite often. I can imagine but two possible causes for Mr. Lewis' trouble; either using an insufficient amount of cement and not troweling the surface smooth after spreading, or using a dry mixture, such as is commonly used for cement blocks. I have seen quite a few of them which would undoubtedly act as Mr. Lewis states, were such a material used for flooring.

The slabs which we use are 2½ inches thick, 2x2½ feet, of same mixture throughout, laid directly on the ground, and we have no trouble from moisture rising through the concrete, so we see no occasion for the six inches of cinders given in the original specifications. Portland cement concrete mixed with a sufficent amount of water is a very different material from that mixed with only enough water to moisten it, and possibly an insufficient amount of cement. The first will be waterproof, the second will be porous, and conduct moisture like sandstone or brick. In one of our houses we used some sandstone and brick to complete an odd-sized floor, and these are always moist on top, except in the driest time in Summer, so that dirt sticks to them, showing need for cinder base.

The first concrete floor we made we used natural cement, which never got harder than dry clay, and in Winter the litter on top of it became as wet as though it had lain in the rain, so we coated it with hot tar, which was effective and made a smooth floor, but we wouldn't do it again, as it must be spread from the outside, owing to the fumes given off, and it is easily chipped, as the tar does not stick to the concrete. Next time we would put on a two-inch layer of Portland cement concrete, mixed with enough water to work easily and troweled off smooth. W. J. M.

Elyria, O.

Reducing Fat Sow; Roup.

1. Will you tell me how I can reduce the fat on a sow which has been bred about two weeks? She is an O. I. C., and I do not want to lose her. 2. Also what kind of a roup cure can you tell me?

New York. F. H. S.

1. If the sow is over fat, reduce her rations gradually until she is getting only enough to keep her in good thrifty condition and provide for the needs of the growing pigs. Do not feed cornmeal, except, possibly, as a very small portion of the rations. Use instead, the bone and muscle forming foods, such as wheat bran, middlings, oats, beans, and barley. The food should be chiefly in the form of slops, and if needed to keep the bowels loose, add a little oil meal to the other grains fed. While a brood sow should not be fat, do not go to the other extreme and starve her. The developing pigs need nourishment. A brood sow should be made to take daily exercise, and a good-sized pasture field provides for this.

2. The best "cure" for roup is prevention by providing warm, comfortable quarters, free from drafts and dampness, and the addition of permanganate of potassium to their drinking water at the first signs of "colds." A stock solution of this may be made by dissolving an ounce of the crystals in three pints of water, and one pint of this solution may be added to each two quarts of the drinking water. M. B. D.

Scaly Leg.

Can you tell me the cause and how to cure scales on chickens' feet? I have just purchased 50 Leghorns just starting in to lay, and have just tried kerosene oil on a few of their feet, but it seems that after the kerosene had been applied to their feet the chickens became sick and stopped laying. Will you give me the necessary information to get rid of these thick scales; also if what you recomend would be good to apply to chickens' feet that have not got scales on, to prevent same from coming on? I have been told that scales are caused by lice. M. J. M.

New Jersey.

Scaly leg is not caused by lice, but by small mites which burrow beneath the scales upon a fowl's shanks and live there. They are usually easily destroyed by the thorough use of kerosene, either as a dip, or mixed with vaseline and used as an ointment to be thoroughly rubbed into the scaly parts. Repeated treatment may be needed to free the fowls from them, and in very severe cases, it is sometimes necessary to soak the fowl's legs in warm water until the worst of the scales can be removed. In your case, two or three good applications of kerosene, or kerosene ointment, will probably suffice. M. B. D.

Frozen Combs.

I have on hand 30 S. C. W. Leghorn males which had their combs and wattles frozen. Some are only slightly touched, while a few are pretty bad. What effect will it have on them as breeders? I want to put them with the hens in about three weeks. What is a good remedy for treating the combs? J. P. A.

Perkiomenville, Pa.

Slight frosting of combs and wattles will probably not interfere with the use of males in the breeding pens, but in severe cases the pain and soreness may make the birds unfit for use. There is little that can be done in the way of treatment; if discovered early, the frozen part should be thawed out with snow. Healing will be hastened if badly frozen portions of the comb are cut away, and the wound kept greased with carbolized vaseline in 5 per cent. strength. M. B. D.

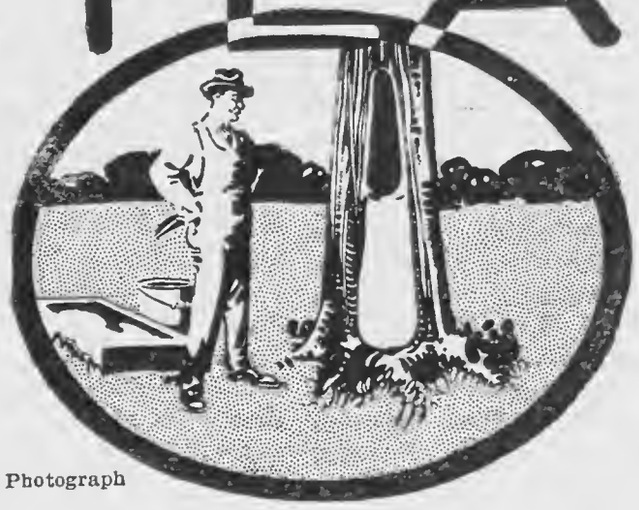
Poultry Questions.

1. How often should deep litter on poultry house floor be replaced? 2. If poultry manure is spread on the surface of the garden in Winter is there likely to be loss of nitrogen? 3. How much yard room is required in the double yard plan for poultry? Where can a discussion of the double yard system be found? 4. Can more Leghorns than birds of the larger breeds be kept advantageously on a given floor area? How many? 5. Do sweet potatoes tend to stop hens laying? Do potatoes and other kitchen vegetable refuse not containing chlorophyll take the place of "green stuff" that is green, for poultry? F. W. B.

Winchester, Mass.

1. Litter should be changed as often as it becomes soiled and packed down by the hens. The time will vary with the number of hens kept and the kind of litter. Probably every four to six weeks would not be any too often in most poultry houses, though every six months would be nearer the interval usually intervening. 2. On fairly level surfaces which do not wash there would probably be little loss of nitrogen from poultry manure spread in the Winter. The best way to keep it, however, is to mix it with sufficient absorbent material and store it in a dry place until it is needed in the Spring. 3. Leghorns do not not require quite the floor space, and perch space, that the larger breeds do but, there is not enough difference so that needed areas have been calculated for each breed. From three to four square feet for each fowl should be provided, and it would be well to give the larger fowls the maximum area. 4. There is no fixed rule for calculating yard room; the more the better. Even with double yards, the largest available space is advisable as more time can then be given to allow fouled ground to recuperate. 5. Vegetables do not exactly take the place of "greens," or those plants made green by chlorophyll, but they frequently have to be substituted for them. There is a tonic effect in "yarbs" that vegetables lack; else why do we crave dandelion greens in the Spring? M. B. D.

ATLAS



Drawn from a Photograph

Save your trees by cutting out the rot, and filling the cut with Atlas Cement concrete. Those trees are worth a few hours' work.

There are so many ways you can use "Atlas" around the place it often pays to keep a few bags on hand in a dry shed. Think of the time it saves.

Ask your dealer for Atlas. You'll be glad you did.

MILKING MACHINE A SUCCESS.

The milking machine is a success beyond a question. There are about 30 or 35 installations in Ashtabula County, Ohio. Dairymen agree the machine cuts milking cost more than in two, that the cows take kindly to the machine, and that it is a mechanical success in the hands of the average man. Three well-advertised machines are in use in this county and in the adjoining counties in Pennsylvania. In the territory tributary to Erie, Pa., there are many installations. One dairyman, G. T. Carr, of the Edinboro Lake Farm, said, should all the help leave the farm, he would, with the machine, be able to continue handling the dairy for considerable time. He uses four units, one cow the unit, and has milked over 50 cows in less than an hour and a quarter. He declared the care of the machine was about the same as that of a cream separator. Parts were flushed, kept in brine water from the evening milking until the next morning. After the morning milking they were more carefully cleansed, and once a week the machine was carefully washed. The milk is more sanitary, and where low bacteria count is imperative, the milking machine meets requirements.

Mr. Carr said he was formerly compelled to search for help, but now men came to the farm seeking employment. He declared the machine paid for itself the first year, and that the expert who installed the machine turned it over to him after the first milking. About six years ago, on the farm of Aaron Worthing, Hillsdale County, Mich., a milking machine was installed. Although much has been done to perfect the machine since that time, it was considered successful. The machine was later abandoned, and I am informed it was due to hired help neglecting the units and allowing them to remain on the cow sometimes a number of minutes after the cow had been milked. The plant is again in operation, and I am informed is doing very efficient service, although it is old style, with some improvements added.

W. J.

Care of Freshening Cow.

What is the treatment for a cow a month or three weeks before calving in respect to housing, feeding and milking?

Mass. L. A. E.

A cow should be dry for a month or six weeks before calving, and during this time she should be comfortably housed, if the weather is cold, or allowed to run in pasture during the natural pasture season. If on good pasture, no grain food is needed, but if she is being barn fed, her rations should not materially differ from those of a milch cow except that they may be somewhat lighter, say about six pounds of grain daily, and cornmeal or cottonseed meal should be sparingly fed, if at all. Ground oats, wheat bran, and wheat middlings are specially adapted to the cow's needs while dry. They furnish the elements needed for the growing calf, and are sufficiently laxative in their nature for the good of the cow. Corn silage, roots, or other laxative foods are specially useful at this time, in the absence of pasture. Aside from good care, reasonable feeding, and possibly, in some instances, a laxative dose of linseed oil or Epsom salts just previous to calving, no special treatment is needed for a cow in calf in good health.

M. B. D.

Wanted—A Dog Law.

Can you take up the problem of a good practical working dog law? I would like to keep sheep, but do not want to risk keeping them for dogs. Can you find the most practical working law now in use in any State or place? I think that if the same degree of good judgment was used in handling dogs that is used with other domestic animals the problem could be solved. In this State dog owners are taxed $1 for males and $3 for females; property holders generally pay, others not. Would not a license law be better than a tax law? Not many females are kept and I believe the males do much of the sheep-killing when away from home, and especially when gathered in packs. If all the dogs not kept especially for breeding were castrated as other animals are I believe they would stay at home much better, and there would be very little sheep killing. This would also stop much of the indiscriminate breeding of worthless dogs. I would suggest a $1 license for a castrated dog or a spayed female, and about $5 license for all others, country and city dogs to be handled under one law, as much of the sheep-killing is done by city and town dogs. I am writing to you for this as we get more practical results with THE R. N.-Y. than anywhere else I know of. E. S. A.

Michigan.

R. N.-Y.—When you strike dog legislation you will find it hard to obtain practical results anywhere. There are men who think more of their dogs than they do of children, and they oppose any effort to suppress their pet nuisances. We will stir up the subject for discussion, but the dogs seem to have more political power than the women.

"Bulgarian Culture" for Buttermilk.

1. What is Bulgarian culture and how can it be made? 2. How is the cultured buttermilk made? H. D. S.

McKee's Rocks, Pa.

The Bulgarian culture is a particular species or strain of the lactic-acid producing bacteria which was first brought into public notice in Bulgaria, where the people have used it for centuries in making a fermented milk similar to our buttermilk. The organism has the ability to produce much higher per cents of lactic acid than our native species, and in combination with certain other organisms produces a buttermilk of very high flavor.

2. In answer to his second question, let me say that by "cultured buttermilk" is usually meant skim-milk which is soured by the action of definite bacteria cultures, the one most commonly used being the Bulgarian organism. It is usually made from skim-milk (sometimes with the addition of 10 per cent whole milk) which is innoculated with the bacteria culture and allowed to sour. Sometimes the skim-milk is pasteurized before inoculation and sometimes used raw. For commercial purposes, the curdled milk is placed in a churn which is revolved a few times to break up the curd to give the fermented milk a smooth creamy texture. The Experiment Station of Urbana, Illinois, recently published a small circular on this subject. I believe it is Circular 166. The Dairy Division at Washington also put out a bulletin on this subject a year or two ago, but I do not know the number of it. It can be had by writing to the Dairy Division.

W. A. STOCKING, JR.

"Now, my little boys," asked a school teacher, "can any of you name a liquid that doesn't freeze?" There was a moment's silence, and then a voice answered, "Please teacher, hot water!"—Melbourne Australian.

Use the *Available* Kind of Fertilizer

For many crops all the *available* plant food that is needed is one grain to each pound of soil.

When such a small quantity of food must do all the work for your crop, it is exceedingly important that what you put into the soil in the form of fertilizer shall be *available*—that it shall have not only the right quantity, but the right quality and right crop value.

It has cost us forty years of experience to know how to mix the right kinds and the right quantities of ingredients for fertilizer.

Bowker's Fertilizers

accomplish also the more difficult task of getting the right blending, the right solubility into a mixture which will run readily and freely from the farmer's planter, and which will remain dry and drillable as well as efficient until used in the field. We make a brand to fit every crop need.

Write and tell us what your crops are, and we will send you our illustrated catalogue.

WILCOX FERTILIZERS

DO NOT OVERFEED STOCKS

The Fertilizers that Fertilize

We know that the materials entering into our various fertilizers contain *nothing* but those elements that long years of practical farming, together with skillful chemical investigation, have proven to be the very richest in plant nutriment obtainable. But we do not stop here; we treat these substances so that they are most easily taken up by the growing plants. Yet at the end of the growing season, WILCOX fertilization leaves the soil in much better condition than it was before. *Send today for our book.*

PRODUCE NUTRITIOUS VEGETABLES

P-H-O-S-P-H-O-R-U-S

THE MASTER KEY TO PERMANENT AGRICULTURE

Phosphorus is so-called because it's use gives largely increased yields of clover, alfalfa and other legumes, which secure nitrogen from the air. The acids formed by the decaying roots of these plants make available the potash which is abundant in most soils. Recorded experiments on all normal soils in the Eastern and Middle Western states show greater profits from the use of phosphorus than from any other element, or combination of elements.

DAYBREAK ROCK PHOSPHATE

13% Phosphorus, Ground 95% Through 10,000 Mesh Screen

Rock Phosphate has been thoroughly investigated by the agricultural authorities and tested in the field by the leading Experiment Stations. It has proved to be the most profitable fertilizer on all soils deficient in Phosphorus, and the the soil surveys show this deficiency in 90% of the cultivated land in the Eastern and Central states. A review of these experiments and much valuable general information about fertilizers is given in "The Farm That Won't Wear Out," by Dr. Cyril G. Hopkins. This book will be sent free to the first 100 farmers who write to us for delivered prices on *Rock Phosphate*, and state where you saw this ad.

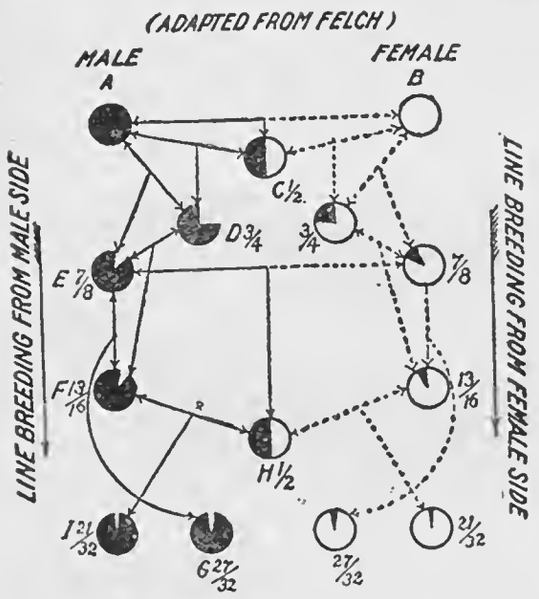
The Henyard.

A Discussion of Line Breeding.

There seems to be some difference of opinion as to what constitutes line breeding. I find that even those who stand high in live stock and agricultural circles differ in defining the terms. Going back about 30 years the term line-breeding, as used in this country, meant the production of animals strong in a certain line of inheritance, i. e., strong in the blood of some particular animal. It is a form of inbreeding. Once started it must be inbreeding. But it is so because of some definite aim. Line-breeding is practiced to perpetuate the blood and characteristics of some special individual of a breed or strain. Inbreeding is simply the mating of animals closely related. Line-breeding, after the first mating, is that kind of inbreeding that breeds an animal strong in the blood of an individual to another animal strong in the same blood. It may refer to the blood of a sire or the blood of a dam, but once it is started both sides of the mating must represent the blood of the individual to which we are line-breeding. To illustrate: I had a colt that I called "Big Ben." When he matured he suited me so well that I wanted more like him.



LINE-BREEDING CHART.

From him I got a fine mare colt. When she matured I bred her back to her sire. This was inbreeding and also line-breeding. It was the second step of line-breeding in the male line. From that time on every horse or mare of that breed that I bred was selected with reference to the blood of "Big Ben." Both sire and dam must have some of the blood of that horse. Had I reversed the process and kept in mind and in line the blood of the dam, then it would have been line-breeding from the dam. Maintaining and perpetuating the blood of a single individual in a flock or herd is line-breeding, but it must always be carried on with reference to the blood of one animal. One can breed as closely and yet not necessarily practice line-breeding. Had I been indifferent in the instance given and bred indiscriminately back to the original dam, and then brother and sister or almost any other form of close breeding, it would not have been line-breeding.

That excellent diagram once published by I. K. Felch, and here reproduced, does much to explain this matter. In conclusion I will say that line-breeding is one form of inbreeding, but inbreeding is not always line-breeding.

Michigan. RICHARD H. WOOD.

A PRIZE TURKEY.

We have a Bronze turkey here that laid 84 eggs last Summer. Can anyone beat that? Please let me hear from some of the turkey raisers. F. C. S.

This is an age of telling about large records and hunting for champions. Can anyone bring forward a turkey here to beat this one?

Two-story Henhouse.

I bought a place of about 2½ acres, on which I would like to keep about 200 chickens. There is a barn on it about 24x30 feet, which I would like to turn into a henhouse. My idea is to keep a place for breeders downstairs and then those just kept for laying upstairs. I have seen that in Europe; they generally keep chickens above the pigpen, as they like to go up high. Will you tell me, if practical, the best way to fix it?

Rochester, N. Y. E. D. V.

The idea of using the second story of a building for fowls seems never to have met with popular favor, though some years ago two-story henhouses were not uncommon. As we do not know of any poultry plants using such buildings today, we conclude that some serious objection must have developed to them in actual practice, even though in theory they would seem to be economical. If you can arrange your barn so as to give the hens on the upper floor access to the ground, it should be an inexpensive matter to fit up that floor for the use of the hens. It should have windows and open-front ventilation such as one-story buildings require, and it may be worth your while to make the experiment; should it prove unsatisfactory your outlay upon it will have been small at any rate. The same precautions should be taken to make the building windtight upon all sides except the one facing the south or southeast as are required in one-story houses, and all interior fittings and arrangements may be the same. A sloping runway will probably be required to induce the hens to go from the ground to their sleeping and laying quarters.

Condition Powders; Hurrying Pullets.

1. The following is a formula to mix with dry feed for laying hens. Will you advise if you would consider this safe to feed mixed in the following proportion? Take 10 pounds of bone meal, 10 pounds of beef scraps, five pounds of fenugreek, two pounds of sulphur, two pounds charcoal, one-half pound of cayenne pepper, one-half pound salt. Mix and keep. Put a half pint in the mash every morning for twenty hens.

2. What would you recommend to use to make pullets lay, and is cayenne pepper a safe tonic to use? G. K.

Trenton, N. J.

1. The use of strong condiments, like cayenne pepper, cannot be recommended, even though in small quantities they may do no harm. It is a mistake to suppose that a local irritant like mustard or pepper stimulates the activity of the egg-producing organs. In sufficient quantity, it would undoubtedly produce a sensation of warmth by drawing the blood to the part irritated by it, just as a mustard plaster upon your own skin would, but irritation is not stimulation, and too long continued, it becomes inflammation and positively deleterious.

2. Pullets can not be "made to lay" except as they are fed a sufficient quantity of food of the right kinds to more than supply the needs of their bodies. The surplus will go toward the formation of eggs if the age of the pullets and other conditions are such as to put in motion their reproductive functions. It should not be forgotten that egg laying upon the part of a fowl is simply nature's way of reproducing that fowl's organism, and is not primarily designed to supply the New York market. That latter function is a perverted one for which man, not nature, is responsible.

Poor Layers.

I have 45 hens and pullets in the same house and give them the same attention, but laying is very poor. I dusted them twice this Winter with Cornell lice powder and I see no lice on the perches, but I think they have worms. If they have what will destroy them? S. L. F.

West Virginia.

A personal inspection of your hens and their quarters might reveal some reason or reasons for the poor egg record that they are making, but without it, one could hardly venture a guess. There has been very frequent complaint this Winter that hens and pullets that started in with great promise have suddenly slacked up in egg production without apparent cause. One is tempted to lay it to weather conditions, but I am afraid that that is too easy an explanation to be scientific. A good general remedy for worms is oil of turpentine, in dosage of one to two teaspoonfuls, diluted with an equal amount of olive or other bland oil, and injected into the fowls crop through a soft rubber catheter. The catheter may easily be passed down the throat to the crop, but care must be taken to avoid entering the windpipe. Small glass syringes holding about the right amount may be purchased at drug stores. M. B. D.

MAPES THE HEN MAN'S STRAIN
Now is the time to get hatching eggs from a strain that has taken 20 years to establish. Nothing but S. C. W. Leghorns on the farm. Good utility stock at $6.00 per 100 eggs. Eggs from special mated hens that weigh not less than five to six pounds at $3.00 per 15 eggs. The pick of my father's 2,000 hens. *Mapes The Hen Man's Son.* JESSE E. MAPES, Middletown, N. Y.

Baby Chicks, Eggs AND CUSTOM HATCHING—Our S. C. W. Leghorns are bred for production and vigor; not for feathers and showtypo. White Orpingtons from Cooks' best. Pekin ducks. M. B. turkeys. Peaceful Valley Farm, Oxford Depot, N. Y.

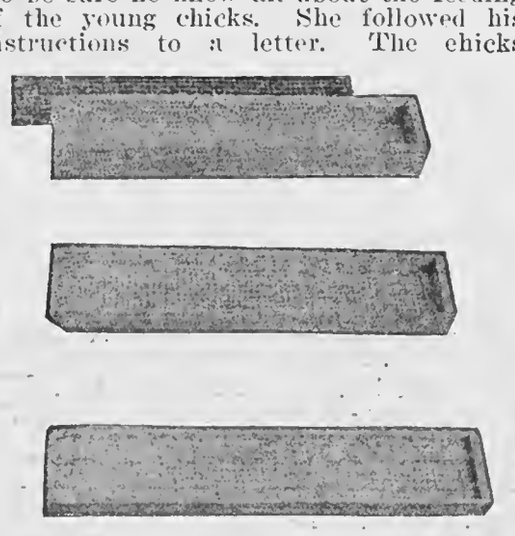
BROODING CHICKS IN LARGE FLOCKS.

Feeding: Mrs. Matthews Tells How.

Will you induce H. E. Matthews, who writes of "Brooding Chicks in Large Flocks," in your issue of Nov. 29, to tell us how he feeds and what he feeds these large flocks, so that each chick gets a plenty and none is run over? H. P. C.

Woman's sphere is talked about
As though it had a limit.
There's not a place in earth or heaven;
There's not a task to mankind given;
There's not a sorrow or a woe;
There's not a whispered "yes" or "no";
There's not a life, or death, or birth;
There's not a feather's weight of worth
Without a woman in it.

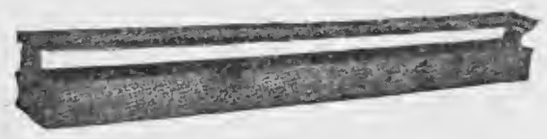
That is now my husband's opinion. A few years ago he started in the "hen business." He was very successful in the incubation, obtaining very fine hatches, but when it came to caring for the same chicks they would die. It was then that he began to think that woman's sphere was not for household duties only. He called on his wife to help him out. To be sure he knew all about the feeding of the young chicks. She followed his instructions to a letter. The chicks



TRAY FOR BABY CHICKS.

thrived and grew so rapidly he asked the reason why they would not grow the same for him. It was a mystery to me too. I could not see why they should grow for me when they would die for him. After going over the matter together we came to the conclusion that the average man does not pay enough attention to the little details which must not be overlooked in raising little chicks. But there is an excuse for our husbands. They have a lot on their minds and in their hearts that we know little about and would understand still less. So it behooves us to put our shoulder to the wheel and help where we are best fitted.

EDUCATING THE CHICK.—When the chicks are just out of the shell I make it a practice to tap on the glass of the incubator door. Chicks learn to come at this signal and at the same time the chicks become acquainted with you. When I have neglected this we notice the chicks are wild and harder to teach. I like to place the chicks under the hover



FEED HOPPER FOR LARGER CHICKS.

when 24 hours old. Care must be taken at this time to teach them the source of heat and how to get back to the heat. If not taught this at once it means trouble. We use boards 10 inches high, which we call educator boards. These are placed about one foot from the hover on all sides. At feeding time they are moved back another foot to give plenty of room that all may feed. Continue the use of the educator boards until the chicks all know where to go for heat. Teach a feeding call by tapping on the feeding board. The chick soon learns to know the attendant, and expects some little titbit every time you come in. Throw out some little scrap and see them run. We keep the temperature near 100 degrees under the hover at first. We like to have heat enough at night so that each chick will lie out flat, with heads just peeping out from the curtains. If little chicks learn to get their heat by bunching together you will have trouble with them to the end, and that end will come very quickly to some of them. An attendant must be constantly with the chick during these first hours of the chick's life. It means a saving of annoyance and labor when they are older. No matter what the size of the flock, whether 50, 100, 300 or 1,000, these same principles apply both in the education and feeding. It must be thoroughly understood that the success of raising the chicks lies not altogether in feeding; pure air, heat and clean water play an all important part. Until every chick learns to go under the hover we put up the educator boards every night, but not as close to the hover as when they were first placed in the brooder.

WHAT WE FEED.—We use the Cornell formula and also use the Cornell type of trays and feed troughs. Mixture No. 1: Eight pounds rolled oats, eight pounds bread crumbs or cracker waste, two pounds sifted beef scrap (best grade), one pound bone meal. Mixture No. 2: Three pounds wheat cracked, two pounds cracked corn (fine), one pound pin head oat meal. Mixture No. 3: Three pounds wheat bran, three pounds cornmeal, three pounds wheat middlings, three pounds beef scrap (best grade), one pound bone meal. Mixture No. 4: Three pounds wheat (whole), two pounds cracked corn, one pound hulled oats. Mixture No. 5: Three pounds wheat, three pounds cracked corn. Never feed a chick until it is at least 48 hours old or older. Do not be afraid they will starve. Nature has provided sufficient nourishment in the yolk of the egg that the chick assimilates. Often bowel trouble results from feeding too soon after they are hatched. It is more important to give them clean fresh water. Teach them to drink by the tapping call on the water cans. Feed five times a day until the chick is a week old, being careful not to feed too liberally. Let them clean up their feed board in 10 minutes, then remove any that is left and give to your hens. Do not give any but clean fresh food to baby chicks. The first feed is mixture No. 1, moistened with sour skim-milk or water to a crumbly consistency, never sloppy. Scatter this on the feeding boards. Grit and charcoal should also be scattered with this first feed. A little of mixture No. 2 should be fed on the boards until they learn to scratch in the litter for it. Place in shallow trays (see picture mixture No. 3, always keeping a supply before them. A piece of wire netting fitted loosely inside the trays prevents them from scratching out the mash. The main feed for about 10 days is mixture No. 1.

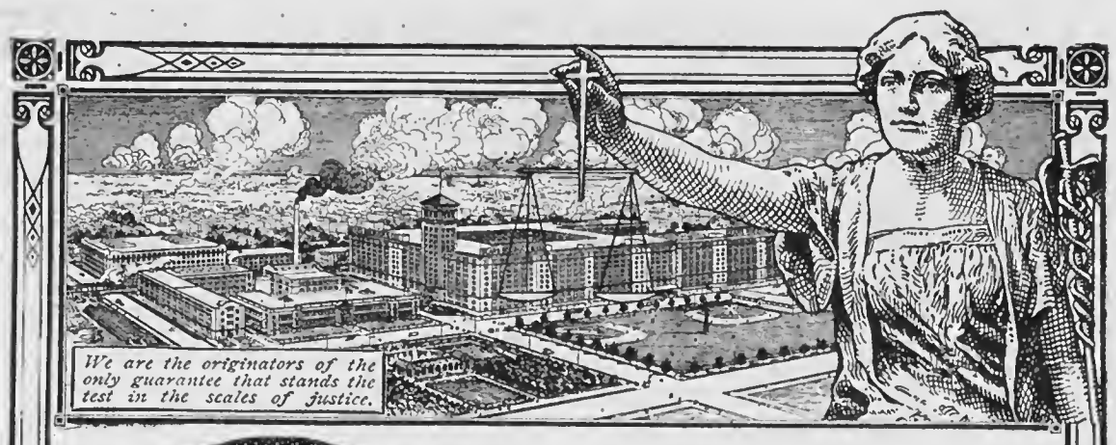
From the age of 10 days to four weeks we gradually substitute some of mixture No. 3 (moistened to a crumbly consistency), for mixture No. 1, always having mixture No. 3 dry before them. From the age of four weeks to six moist is given twice a day with grain in the litter. Dry mash No. 3, grit and charcoal always before them in trays. From the six weeks age there is but little to do beside giving them all they can eat at all times. Mixtures No. 3 and No. 5, are hopper fed. (See picture). A moist mash once a day will hurry them along. Pointers in feeding large flocks: Chicks should all be of the same age in large flocks. Some makers of brooder heaters say different ages can be brooded at one time. Don't try it. Cull out the weaker chicks and place in flock of smaller chicks. The weaker chick although older needs the stimulating food of the younger chick. Scald water cans often. Keep brooders clean. Feed small chicks over night with grain in litter so daylight finds them feeding. Avoid mouldy litter and mouldy grain. Feed plenty of green food—sprouted oats, beets or cabbage.

MRS. H. E. MATTHEWS.

Poor Laying.

For the past few years I have wintered over several hundred Leghorns, the feeding method being grain in the morning, then wheat middlings and bran (wet mash) before them until, say noon, then heavy grain feed about four o'clock. This method has been very successful and at this time of year, generally, I was getting a fine output of eggs. This year my pullets (about 200) laid well till a few days ago, when they "laid off," the output falling off one-half. The hens don't look right. My method this Winter varied only in the mash—where I have been feeding bran and middlings with big proportion of meat scrap and linseed meal. Could these last two ingredients have caused the slump from over nourishment? POULTRYMAN.

You do not say what proportion of your mash is made up of meat scrap and oil meal. It is quite possible to feed too much of these high protein foods. I would not recommend a larger proportion than 5% of oil meal and 20% of beef scrap in the same mixture. It is not a good plan to keep a moist mash before the hens; they will overeat if this is done. A dry mash is difficult to swallow and the hens will eat only a mouthful or two at a time; this makes it practicable and economical to keep dry ground grains before the fowls in an open hopper to which they can go at any time they please. This is not true of a moist mash, however, and if this is fed, it should be in limited quantity which will be quickly cleaned up. M. B. D.



ECONOMY Gasoline Engines

Our low prices are the result of modern methods of manufacture, enormous output and direct from factory selling. Our guarantee, "Your money back at any time if you are not perfectly satisfied," and our reputation for fair and square dealing make you sure of the quality of Economy Engines.

The following prices enable you to buy a large and a small Economy engine for less than the price of one *ordinary* engine.

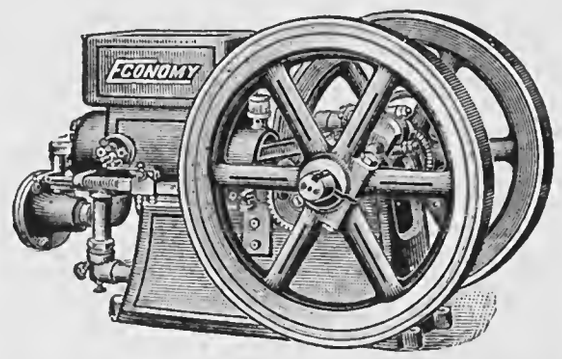
1½-H. P., $29.95; 2-H.P., $39.95; 4-H.P., $72.95; 6-H.P., $102.95; 8-H. P., $149.65; 10-H. P., $219.50.

Turn to the gasoline engine pages of our new big General Catalog, see our complete line of sizes for every purpose. If you haven't our new big General Catalog, just write "Gasoline Engines" on a postal card and also request our free Catalog No. 66R71

EVERY Economy Gasoline Engine is required to pull more than its rated horse power before it leaves our factory. Every part of the Economy fits perfectly, which means less friction, less wear and greater economy of fuel. Duplicate parts are absolutely interchangeable.

The Economy is the simplest engine on the market. It has fewer parts, is easier to operate and is guaranteed to give as good service for as many years as any other make, regardless of price.

If you need a gasoline engine, you will purchase an Economy if you investigate thoroughly, because you cannot find its equal at anywhere near the price we ask.



Sears, Roebuck and Co., Chicago

Let me send you a WITTE Engine, to earn its own cost while you pay for it.

GET your engine from an Engine Specialist, on any suitable reasonable terms, at a fair price.

LOOK AT THESE NEW PRICES!

2 H-P, $39.45; 4 H-P, $75.50; 6 H-P, $99.35; 8 H-P, $149.90; 11 H-P, $218.90; 20 H-P, $389.50. Other sizes up to 40 H-P proportionally low.

Why pay two prices for a good engine, or take chances on a poor, or an unknown engine, when the "WITTE" costs so little and saves you all the risk! You can pay more than my prices, but you can't get better engine-value from any one. That's what my thousands of customers say and they ought to know.

WITTE ENGINES, Kerosene, Distillate, Gasoline and Gas

60 DAYS FREE TRIAL. 5-YEAR GUARANTY. DIRECT FROM FACTORY TO USER.

Made in sizes 1½, 2, 4, 6, 8, 11, 12, 15, 20, 25, 30 and 40 H-P. Styles, Stationary, Skidded, Mounted and Sawrig. Standard for 27 years—almost ever since there have been any gasoline or oil engines.

In all those years the "WITTE" has proved its high-quality value at all kinds of work, in all parts of the world. It is today **better** than ever, while the price is **lower.** My manufacturing advantages make this possible. I am simply sharing my advantages with engine buyers. Let me write you more about it and post you on engine buying.

AILING ANIMALS.

Constipation.

My collie dog is constipated, and has been so for a long time. He has table scraps to eat and is very fond of sour milk and buttermilk. What can we do for him? I. M. A.

Make the dog live out of doors as much as possible and feed one small meal each night. Do not feed potatoes. Twice a week feed parboiled liver and increase to three times a week, if found necessary to keep the bowels active. If this does not suffice give a dose of castor oil in milk. A. S. A.

Sick Hogs.

A hog that I was fattening all at once stopped eating, for two weeks, and then staggered around and died. Hog was fed water and corn. Since then I have lost another. R. P. D.

New Jersey.

Your description does not make a confident diagnosis possible, but hog cholera has been so prevalent that one must suspect that it was present here. Acute indigestion from irritating feed might cause somewhat similar symptoms. Stop feeding corn and feed light, laxative slop, adding roots and Alfalfa hay, and making the hogs take abundant exercise every day. If more are sick have a local, graduate veterinarian make an examination and vaccinate the remaining pigs, if cholera is found present. A. S. A.

Tumor.

I had a one-year-old hog that some time ago almost stopped eating, and did not seem to have much life about it. It lived on about six months barely eating enough to keep it alive. I killed it a few days ago and on examination found that one kidney had grown to an enormous size, weighing 51 pounds, and was filled with a watery substance. I would like your opinion as to what was the matter. S. W. Z.

West Virginia.

A cancerous tumor no doubt was present, and such a condition is uncommon and incurable. It may be set down as an accidental case, the like of which will never be seen again. No explanation can be given as to the cause of the tumor. A. S. A.

Nailprick.

Seven weeks ago my horse stepped on a nail, which entered the foot in the crease beside the frog. I did not discover it until next morning after having driven him six miles in that condition. I then drew the nail and filled the wound with balsam of myrrh. Next day had a veterinarian cleansed the foot, gave the usual treatment to prevent lockjaw. Later I applied poultices and after a little blistered the ankle, but the horse is as lame as ever, and I cannot use him. Can you tell me what to do? A. E. K.

The wound should have been freely opened to allow vent of pus. This may still be necessary. Clip the hair from the hoof-head and blister with cerate of cantharides several times at intervals of ten days. This will suffice if the flexor tendon or navicular bone was not injured or the joint opened by the nail. In bad cases a skilled surgeon has to operate. A. S. A.

Ringworm: Worms.

1. Will you tell me what to do for our cattle? The hair comes off in patches leaving a thick white dandruff. It starts around the eyes. They are well fed and sheltered, have salt and aside from this skin disease seem all right. 2. I would like to know what to do for our Llewellyn setter, now five years old. When six months old he had distemper, but owing to illness in the family was not properly cared for. His eyes have been bad since then, the haw nearly covering the ball at times. When he was a pup we gave him worm medicine, and he passed quantities of worms. Would he be likely to have worms yet? E. S. C.

Idaho.

1. Ringworm is present. Scrub each spot clean, and when dry rub in some iodine ointment, repeating the application each other day until recovery. 2. The dog no doubt has worms. Give him worm medicine to be bought ready for use at the drug store. Bathe the eyes twice daily with a ten per cent solution of boric acid. A. S. A.

Obstructed Teat.

One of my cows has one hind teat scabbed over; had to pick off the scab and milk with a tube. Seems to go up farther than just end of teat. That got better, then the other commenced; can get hardly any milk without a tube. What is it and what can I do for her? F. A. G.

Such sores come from infected floors, or from infected matters carried by the milker's hands. Often the sore starts from a scratch made with the finger nails, which are left too long. Do away with such causes. Treat by soaking the affected teats in a hot saturated solution of boric acid, night and morning, and then apply boracic Perm to the sores. If a sore is tardy in healing paint it with tincture of iodine each other day, in addition to the other treatment. Milking tubes tend to carry infection into the udder. They must be carefully sterilized by boiling before use, otherwise they are an abomination. Where a warty growth forms in the end of the teat it should be rimmed out with a small sharp scalpel, or cut through in four different directions by means of a sharp, clean teat bistoury. Such operations are best done by the expert veterinarian. A. S. A.

Obstructed Teat.

In the lower end of the right front teat on one of my cows is something which prevents the milking. We have drawn the milk twice by forcing a quill in the teat about one inch deep, which allowed the milk to flow. The obstacle felt like a pea. From outside nothing can be seen on the teat. She has pain as soon as we touch the lower end of the teat. R. G.

New York.

Infective matters have already been carried into the udder by the quill and it is likely that the function of that quarter will be lost from destructive garget. The right treatment would be to have a veterinarian rim out the growth with a small, sharp knife, then soak the teat twice daily in a hot, saturated solution of boric acid and each other day apply tincture of iodine if the sore is tardy in healing. If the veterinarian does not care to cut out the growth he no doubt will slit through the obstruction in four different directions, by means of a teat bistoury and then have a stream of milk stripped away several times a day while healing is proceeding. A. S. A.

Eye Ailments in Animals.

I notice on page 1334 two inquirers asking for advice in regard to eye ailments. May I take the liberty of criticizing the manner in which treatment is advised? In the first case of the injury to the ox a more definite statement should be asked for, viz., is there any circumcorneal injection, watering of the eye? These traumatic cases nine times out of ten result in an iritis, in which case the treatment would be the instillation of atropine, four grains to the ounce of water, in connection with the antiseptic application as suggested. In the case of the dog which is blind in both eyes we have a case of congenital cataract, or a case of corneal scar due to a recent ulcer. If the inquirer gives a history of watering of the eyes, a tendency to avoid the light and redness of the eye covering (conjunctiva) and above all that the dog did see when he was born, then your diagnosis is corneal scars. The treatment should then be a 1% yellow oxide of mercury ointment, applied locally, internal remedies help but little. If the case is cataract remedies will not help.

The Henyard.

Skim-Milk For Hens.

Will skim-milk, soured, take the place of meat scrap in a ration for laying hens? If so, how much should be fed to a flock of 65 hens? Would the Philo system of brooders be a good one for an amateur to use to rear chickens? Will Alfalfa meal be sufficient green food for Winter layers? O. T. J.

I do not think that soured skim-milk will wholly take the place of meat in rations for laying hens, but it may replace the greater part of it if it can be had in sufficient quantity. Hens may be given all that they will eat of it, but they should also have fresh water before them and not be compelled to make the milk their sole drink. By the Philo system, I presume that you mean the use of fireless brooders; these are entirely practical, and while requiring more attention than heated brooders, give the best of results in careful hands. I would not recommend attempting to follow any "system" in their use, but would learn the principles of their operation and adapt them to my own system. I have raised hundreds of chickens with no other hover than an empty bran sack or two, and would ask nothing better after settled warm weather has arrived. Alfalfa meal does not replace succulent food like cabbage or beets, but if these are not available, steamed "short cut" Alfalfa is perhaps as good a substitute as any, and this or clover should be fed if it is practicable to obtain it, even though succulent foods are also at hand. M. B. D.

Pigeon Questions.

Will you give full information on raising pigeons? I have a couple of Homer pigeons, but I cannot tell the difference between the male and the hen. P. R. S.
Reading, Pa.

Old fanciers claim to be able to determine the sex of pigeons by feeling of the pelvic bones, but a beginner could hardly do it. The male usually struts about a female, ruffling his feathers and cooing. Consult some local pigeon fancier. If they do not breed soon try another pair if you wish to keep pigeons. Keep them supplied with plenty of fine mixed grain, grit and water. Provide boxes for nests. Tobacco stems, if available, will be used by them in nest-building and will help keep away lice. W. H. HUSE.

Mating Turkeys.

I have two hen turkeys, one not six months old and therefore not old enough to be the best type of breeder, and the other a year older and a good layer, sitter and brooder. I do not want a gobbler around, as he would molest my chickens. Would it be practicable to take my old hen to a gobbler at the beginning of the laying season, as I have read that a single impregnation is enough for a clutch of turkey eggs? G. S. H.
Ballston Lake, N. Y.

Yes, turkey hens are frequently permitted to run with the male of another flock for a short time previous to the natural laying season and then removed. If they have mated with the turkey cock, their eggs will be fertile for an indefinite length of time, probably for the season.
M. B. D.

Care of Young Ducks.

Will chickens and ducks hatched this Spring and Summer moult this Fall? My ducks are 14 weeks old, Indian Runners, and show no sign of curled sex feathers. I expected to sell the drakes as broiler ducks at 10 or 12 weeks old. When can I tell them apart? They are on range; should I put green food and sand in their ration, or will they now get it for themselves? They wander all around even by night; how can they be caught when necessary? They have outgrown the coop they were brooded in. I understand a low building is enough for them, but what about it being snowed under in Winter? Would it be feasible to enclose a small coop in a shed and have the top of same lift off so that I could get in to clean out the coop and get eggs without being exposed to the weather? I have several unused box stalls; would one of these make a good place to keep the ducks? How many square feet of floor space would you recommend for each duck and how high would you advise making their house?
Ballston Lake, N. Y. G. S. H.

Ducks usually begin to moult and grow a new crop of feathers soon after the age of 12 weeks. From then till cold weather there are usually some in every flock that will be found with pinfeathers. For the most profit ducks should be killed and sold between the ages of 10 and 12 weeks. Curled feathers in the tails of drakes sometimes fail to appear. They are usually later than the change in the voices of the ducks. These develop a quack, while the voices of the drakes remain at a higher pitch.

Young ducks should always have grit mixed with their mash. For older birds it may be kept in boxes. They will help themselves. If the old ducks have free range as long as the ground is bare they will not need much if any green feed. They should in any case be confined to a yard or house at night for protection, and to save any eggs that may be laid during the night or early morning. Coops are not advisable for ducks. A building with protection enough for all kinds of weather with good ventilation is best. Ducks can be "kept" in small quarters, but to do well they ought to have about 10 square feet for each bird. A few ducks might be kept in box stalls if they have a chance to get out into the sunlight and air during the day. A three-foot fence or partition will keep in most Indian Runner ducks.
W. H. HUSE.

Frozen Comb.

I have a valuable S. C. White Leghorn rooster that had his comb and wattles badly frozen during the late severe cold spell. I have heard that it will spoil his usefulness as a breeder. Does anyone know whether this is true? W. L.
New York.

The freezing of the comb will not interfere with the usefulness of a male bird after he has got over the pain and soreness in the frosted parts. It is well sometimes to cut the frozen portions away, and hasten healing by the application of carbolized vaseline in 5 per cent. strength, such as can be purchased at any drug-store. M. B. D.

Poor Egg Yield.

1. Is there anything missing in my poultry ration? I have 60 pullets, Leghorns; they started to lay in October and were laying 14-15 per day; then they dropped to about five per day, and I cannot get them above that. They had a dry mash before them all Summer. My dry mash is 100 pounds bran, 50 pounds cornmeal, 50 pounds middlings, 100 pounds short-Alfalfa, mixed oyster shell, beef scrap in separate hopper. Grain or corn and oats 1½ pounds each night and morning. I also give a moist mash in the middle of the day of stale bread, oats and dry mash. 2. Am I feeding my cow right? I feed 10 pounds per day of bran, cornmeal, and middlings mixed, and all the hay she will eat. J. J.
Sparkill, N. Y.

1. Your poultry ration is all right, though one of the formulas frequently recommended in these columns would be a little better balanced. These formulas vary because not all poultrymen have access to the same feeds, and it is not essential that all fowls be fed exactly alike, or that any fowls be fed exactly the same foods at all times. The essential thing is that there be a proper proportion between the fat-making and the egg-making foods. It seems to be a particularly frequent experience among poultrymen, this year, that pullets that begun well in the Fall slacked up with the advent of cold weather, and refuse to begin again. It is possible that the prolonged warm weather of the Fall, followed by sudden and severe cold, is responsible for this condition of things. Your henhouse (12x20) is amply large for the number of pullets that you mention.

2. Your grain ration for your cow would be improved by substituting either gluten feed, buckwheat middlings, dried brewers' or distillers' grains, or cottonseed meal, for the wheat middlings; though if the cottonseed meal is used, it would be best to use in the mixture a little less than one-third of this ingredient; say, 60 pounds of cottonseed meal to 100 pounds of bran and cornmeal.
M. B. D.

Chicken Chowder makes Chesty Chix.

It makes them grow twice as fast. This means large profits, heavy egg production and vigorous chicks that withstand disease. You can't afford to be without this *growing feed* now, any more than you could afford to be without it last winter when you proved that "if Chicken Chowder won't make your hens lay they must be roosters." Feed Chicken Chowder in addition to Purina Chick Feed and double your profits. For sale by leading dealers. Order from your dealer today.

Checkerboard Poultry Book FREE!

For your dealer's name we will send you this 48-page Poultry Book, containing plans of houses, breeding and feeding charts, space for daily egg records, cures of diseases, care of baby chicks, etc. It also contains information about Col. Purina's half price galvanized iron Chick Drinking Fountain (2 for 25c), and more details about his Automatic Chicken Chowder Feeder (50c). Write today.

Col. Purina, Purina Mills, 827 Gratiot Street, St. Louis, Mo.

THE EGG-LAYING CONTEST.

To bring these reports more up to date, two weeks, doings are reported this week. The eleventh and twelfth will both be given.

In the eleventh week, ending January 16, 808 eggs were laid, 43 less than the previous week. The loss is due to the falling off in egg production of the White Leghorns. Nine pens did not lay an egg, two pens produced one each, two pens laid two eggs each, one pen three, etc. The pen of White Leghorns from Storrs Agricultural Station (the pen fed sour milk in place of beef scraps) laid 33 eggs; 11 more than any other pen of Leghorns. If this pen keeps on they will soon lead all the Leghorns, they are but 36 eggs behind the leading Leghorn pen now.

Tom Barron's White Wyandottes beat all other pens again for the eighth week in succession. His score for the week is 36; the total is 432, 68 eggs more than any other pen of any breed. Barron's White Leghorns "sympathized" with the other Leghorns to the extent of laying only three eggs during the week. Their total to date is 209; less than half the number laid by his Wyandottes. Collingwood's pen of "Dunghills" equalled Barron's Leghorns, for they laid three, last week and this week. But out in Missouri Barron's White Leghorns have led all other pens, and his Wyandottes lead all the Wyandottes. The Missouri contest has the largest number of birds, 1,040 competing. There are 820 at Storrs, and 500 at Thorndale, Pa.

The best records made at the Missouri contest for the month of December are as follows:

	Eggs
White Leghorns, England	206
Buff Orpingtons, United States	152
Anconas, Missouri	147
White Leghorns, British Columbia	133
White Leghorns, Vancouver Island	109
White Leghorns, South Africa	86
White Leghorns, New Zealand	82
White Wyandottes, Ontario Canada	66
White Leghorns, Australia	33

Only 739 eggs were laid at the Storrs contest, in the twelfth week. This is 112 less than the previous week. But this week, ending January 23, includes the bitter cold Tuesday, and the only slightly less cold days of the rest of the week. Egg production about here was cut down one-half by the discomfort of the intense cold. Nine pens of the Leghorns did not lay an egg, and the highest number laid by any Leghorn pen was 21, by the pen from Storrs Agricultural Station, the "sour milk" pen.

So far in this contest, White Wyandottes have far outlaid any other breed. Below are the figures for the twelfth week, and the totals of some of the best pens.

PUBLISHER'S DESK

The spirit moves me and I must obey, or shall I say that it was stirred into existence again by the comments made by you in answer to a delightfully appreciative letter of Charles T. Root in the January 10 issue?

About four years ago, just prior if I recall it rightly to your starting the Publisher's Desk Department, I sent you $5, same to go toward a fund to help pay for costs in smoking out swindlers, grafters, guffers, and the species parasitus ubiquitous. I did this wholly from a sense of justice, feeling as I did that the work you were doing along this line, and in which you were practically pioneering, quietly, unobtrusively yet persistingly, was and is of such incalculable value as makes one feel as though it were a privilege to "ask himself in on the job."

You, as ever, characterized your policy in crediting me with a five years' subscription, that your attitude in assuming that the proprietors of a newspaper occupy a position of public trust, and that, therefore, in assuming this work unaided and alone you were acting the part. That all this endears you to all who, disdaining to act for the glory of mankind (or their own soul) yet are heart and soul for the square deal, is answered in your every issue. Permit me if you will, however, once again to insist that as you tell us in the same issue that many offer to help whenever trouble presents itself for settlement, permit me again I say, to suggest that the policy of THE R. N.-Y. is of incalculable value to every man, woman and child. If in nowise associated with the mere making of the swindler to disgorge or of exposing them, how it has helped in the uplifting of the business ethics, how innumerable other magazines and newspapers have followed in line in this good work, the facts attest, and everyone knows of it, even if they are *not* aware of the fact of your having "started something" in your espousing of this great and good work.

Again I would suggest that a fund to help pay expenses to prosecute this work should be formed; possibly a society or a committee, if you like, to account for the moneys spent by you from said fund. This would relieve you of the extra expense needed to keep the paper up to the standard you so efficiently maintain and relieve you of the necessity of the "hustle, hustle" for new subs. Real champions of common old-fashioned decency and the square deal are also few enough. Let us help to make your trials less trying—your tasks less arduous. Let us have the pleasure in so doing since it were a real labor of love. IRA ULMAN, M. D.
New York.

This is an instance where the good intention of our friends to relieve us of one burden actually puts a new load on our backs. Think of the responsibility of administering a fund for the purpose suggested in the above letter. Of course the suggested committee to account for the fund of the public as all public funds should be accounted for would relieve the situation somewhat; but we will do better to go on as we have begun on the confidence and moral support, and such other assistance as those who sympathize in the work can give. Since we began the work, clubs and vigilance committees have sprung up in all parts of the country and many papers have cleared their advertising columns of frauds and swindles. The publishers demonstrate the situation. Dishonest advertising could not live a month without their help. Nor could the swindlers thus promoted otherwise be successful if the publishers generally would tell the truth about them. We are in sympathy with every honest and practical suggestion to curb dishonest traffic. A society or committee of citizens not allied with publishing or advertising would give the greatest impulse to the work of suppressing dishonesty and frauds. There need be no cash dues. Each member could simply furnish his or her own postage. The members would simply pledge themselves to refuse to read or admit to their homes any publication that carried dishonest advertising or that published tainted literature. They would charge themselves with the duty of protesting to publishers every time they saw cause of complaint and of reporting to the secretary of the society the number of protests made. The secretary would make an annual report. Such a society would drive fake advertisers and fake papers out of existence in short order. We will help organize it any time that we can start with 100 members; and will suggest Dr. Ulman as the first President.

Mr. Max Marx, attorney for the Consumers' Butter and Egg Company, has made small cash payments on the amount due our subscribers for shipments to the company, with advice that a two year note will be sent for the balance. There is no special provision made for the payment of the notes and at least they are of doubtful value. Houses offering better than the market price are usually to be avoided.

The victims of promotion schemes usually get impatient with the receivers and State officials and courts and processes of law generally into which the concerns ultimately gravitate. The victims seem to think, perhaps naturally, that the courts and officials ought to be able to straighten out the affairs of the concerns in short order; and return them their money in whole or in substantial part. Their ideas of the business, if business is was, had been very rosy when the investment was made, and they carry the optimistic view with them into bankruptcy. The courts, however, find that the promoters worked not one but maybe a dozen different schemes and one of these was so interwoven and interlocked with the other that it was impossible to tell where one left off and the other began. This intermixing is usually effected with a purpose of deception and when the accountants get to the bottom of it they discover that there is little or nothing left on which cash can be realized. Sometimes it is asked, "What then is the good of apprehending them? Why not let them alone since the victims can hope for little or nothing anyway?" First, it is worth while to get back what little may be left. Second, it saves many of the victims from putting in more and meeting additional losses. Third, it protects other innocent persons who would be influenced to put themselves in the position of the first victims. Fourth, it discourages promoters and keeps rogues in check. It warns innocent investors against get-rich-quick schemes, and emphasizes public protest against thieves.

The attached advertisement of the Globe Association, Chicago, shows that they are at it again, offering 100 pounds of sugar for $1.75. The advertisement was taken from a cheap paper published in the State of Maine. Please sound a new word of warning. P. J. B.
Connecticut.

Certainly no old reader of THE R. N.-Y. will get caught in this trap. The only condition on which anyone can get sugar at this price is by ordering something else that you do not want and paying for it more than it is worth. But the real object is to get you to take an agency to help the concern fake your neighbors.

I don't want any premiums. The pleasure to me that my neighbor took the paper is a premium of great value to me. J. S. R.
Pennsylvania.

While we are always glad to reward those who take the trouble to send new subscriptions, we cannot help appreciating the sentiment of letters like the above, which often reach us. Friendship and interest of this kind is without price. We could not pay for it if we would. It has been a great factor in building THE R. N.-Y. up to its present proportions. We also need those who are willing to devote a little time to the work for the rewards, and we welcome it all, and feel thankful for it all.

The Missouri Supreme Court recently issued a decree of ouster against 20 wholesale lumber companies, forbidding them to transact further business in the State. It also canceled the licenses of four companies not incorporated under the State law. The defendant companies were fined heavily, the total reaching to $436,000. The ouster decree then was suspended, but will be enforced against any of the defendant companies which violate the rules of conduct which were laid down by the court. The suit of the State was based on the theory that the wholesale dealers named were members of the Yellow Pine Manufacturers' Association. They were charged with price fixing, curtailing the supply of lumber, and with instituting boycotts against retail dealers who failed to obey their dictation.—Chicago Tribune.

The suits that resulted in the above finding were started in 1908 by the then Attorney-General, Herbert Hadley. The decree of the court sustained the contention that the companies in the combine entered into an illegal agreement to control the price of lumber and limit its production. J. J. D.

SHERWIN-WILLIAMS
PAINTS AND VARNISHES FOR FARM USE

Paint as an investment. Paint for what it saves you. Paint because it makes your buildings last longer. Paint because it makes your property worth more today and worth more five years hence.

SWP
(Sherwin-Williams Paint, Prepared)

does more than merely spread over the surface and look well. It goes down into the wood, takes hold and hangs on. It covers well—and lasts. It halts depreciation. Use it in all important outside painting. For every paint use, indoors and out, about your property, you need the helpful aid of our book, "Paints and Varnishes for the Farm." We'll send it without charge. Ask for it.

Turkeys	26	@	30

PRODUCTS, PRICES AND TRADE.

The one-fourth cent cut in wholesale milk referred to previously has been extended to cover more business during the week. There is still, however, considerable trade at prices previously reported, $1.71 to $1.81 for C, and $1.91 for B. The new N. Y. health director has declined to extend the date for compulsory pasteurization, which was in effect February 1. This means that all B and C milk must be pasteurized, even though sold for cooking purposes. The only exceptions to the order will be specially inspected grade A and certified milk.

*

Butter advanced one cent during the week over its last reported low record for this part of the year. Most of the wholesale business in fresh creamery is in the range of 26½ to 27½. Several hundred tubs of best storage creamery have sold at 27½. Trade in worked over and packing stock is dull, the receipts showing a heavy proportion of low quality. During January, 210,000 pounds of foreign butter was received at New York. Practically all of it was sold at once to consumptive trade, only 800 pounds being stored. According to the Custom House report the countries of import, quantities and values were as follows:

	Pounds	Values
Denmark	15,072	$3,932
Germany	16,398	2,682
England	44,523	11,149
Canada	25,213	4,790
Argentina	100,800	26,168
Turkey, Asia	6,158	1,364
France	726	243

*

Fancy white eggs are held at practically the same price as last week, 39 cents, but this refers only to large sizes. Those with but a slight mixture of small sizes go at 35 to 37 cents, and few colored eggs bring over 33. In western gathered eggs of high quality, sales at 28 to 33 cents are noted. Prices are weak on storage stock, 26 to 27 for good grades.

*

Up to January 16, cotton ginned in this country amounted to 13,589,171 bales. In an average of seven years it has been found that at least 95 per cent of the current crop is ginned at this date. The figures given include 76,182 bales of Sea Island cotton.

*

The Boston wool market has been firm during the past week, and decidedly in the seller's favor. Stocks in dealers warehouses are getting low, and contracts for several million pounds on the sheep's back are reported in the west at prices running from 12 to 15 cents. Sales of fine unwashed Ohio and Michigan have been noted at 22 to 23 cents, and washed Delaine 27 to 27½.

*

The Brooks weights and measures law is now in effect in N. Y. State. It provides that:

Bread must hereafter be sold by weight, marked on the loaf or wrapper in boldface type.

Candy in containers must be marked either with the net weight of the contents or with the gross weight and weight of container immediately thereunder, or with the number of pieces of candy.

Wood shingles for building must be sold by numerical count.

Salt must be marked with number of pounds in the package, a three per cent variation being allowed.

Canned goods must bear net weight of contents in pounds or ounces, or by the weight of the fruit or vegetable and the weight of the immersing fluid separately, or by the total contents in gallons, quarts, pints, half pints, gills or fluid or fluid ounces.

All meats, butter and cheese must be sold by weight, and packages containing these and poultry products must be plainly branded with the net quantity in terms of weight, measure or numerical count. Butter in prints must be marked in avoirdupois pounds or ounces in letters at least three-sixteenths inch high. An extreme variation of three-eighths ounce will be allowed on a one-pound print, but on a lot of 12 prints the shortage must not average more than one-fourth ounce per pound.

It has been a quite common practice with farmers to ship a case of eggs on a certain day, even though a dozen or two short of the full 30 dozen. This will apparently be against the law now unless the exact number is marked plainly on the case.

Violations of the law are finable at from $25 to $100 for first or second offense and $100 to $500 for third offense.

The FARMERS' BUREAU an agency exclusively for agricultural help. Only first class farm help and positions solicited. References investigated. Scientific advice on farm problems. Dept. R, 150 Nassau St., N. Y. Phone, 5565 Beekman

Subscribers Exchange

ROOFING SALE

More than $500,000 worth of every make and kind of brand new, dependable roofing now being offered at such remarkably low prices, that we ask all in need or who contemplate buying to hesitate placing orders until they get these remarkable

Bankrupt

Prices. This lot consists of every known make of roofing—Galvanized, 2¾c per sq. ft.; Corrugated Steel, 1¼c per sq. ft.; Rubber Surfaced Ajax Roofing, 62c per square, etc.

DOWN GO ROOFING PRICES

Our World Wide Roofing Defy!

We challenge the world on roofing prices and quality. We positively guarantee to save you from 30% to 50% on any kind of roofing whether metal or ready roofing and we challenge any manufacturer, dealer or mail order house in this or any other country to sell our quality roofing at anywhere near the price that we are offering it. This challenge is open to all and we back it up with the entire strength of our $10,000,000 capital.

When we say that our roofing prices are "lower" than all others we do not mean that we have shaded our prices just a trifle in order to make it possible for us to issue this broad and sweeping challenge. It means that our prices are **way** below the prices quoted by all other concerns—that we do in fact, save you anywhere from ⅓ to ½ on all your purchases of either metal or prepared roofings and we give you a binding guarantee to that effect.

Make Us Prove Our Claims

When we make claims as strong and unqualified as the foregoing, you owe it to yourself to make us **prove** them. Because if we can actually save you from 30 to 50 cents on every dollar you spend for roofing and also guarantee the quality, you surely want to benefit yourself by this great saving.

We don't ask you to take our word for it nor the word of our thousands of customers all over the country who **know from experience** just how much they have saved by sending us their roofing orders. You can easily prove for yourself every claim we make without any expense or obligation on your part.

Get Free Samples And Freight Prepaid Prices

and it will take you less than five minutes to figure out just how **great** your saving will be on any amount or kind of roofing you buy. We will send you a liberal assortment of free samples of Galvanized Steel Roofing of different weights in corrugated, flat, V crimped and standing seam, Brick Siding and Beaded Ceiling and also samples of our famous Rawhide Ready Roofing, rubber surfaced, pebble, flint and marble coated in 1, 2 and 3 ply. By comparing these samples with other roofings you can judge the **qualities** for yourself. By comparing our **freight prepaid prices** with prices quoted by others you will know to a cent just how many dollars you can save if you place your order with us.

You positively cannot afford to buy a single foot of roofing material of any kind, whether it be for house, barn, granary, sheds or any other purpose until you first get this big lot of **free samples** and learn for yourself how much we can save you. Mail coupon for free samples and freight prepaid prices **today.**

Why Our World Challenging Low Prices Are Possible

We are known the world over as the **World's Greatest Price Wreckers.** Twenty years ago under the name of the Chicago House Wrecking Company, we started in the business of buying up and wrecking large buildings, expositions, etc. In the work of dismantling large buildings we encountered every kind of roofing material. We learned which kinds wore the best and longest and why—the advantages of metal roofings and the advantages of Ready Roofings. We made a study of their strong points and of their weak points. And we determined that if we ever sold roofing of any kind it would be only of a quality which could honestly be said to have **all** of the strongest points of the best roofing made and not a single one of the weak points.

Today we sell more roofing and building material of all kinds to the consumer than any other concern on earth. Most of our roofing is made by us. In making roofing our many long years of experience taught us what methods and materials should be adopted in order to get an absolutely storm-proof, water-tight, fire-resisting roof of the highest attainable quality and just what to avoid in order that our roofing might not have a weak point about it. Send for free samples and see how well we have succeeded by making a comparison of our roofing with others.

We also buy roofing in vast quantities at manufacturers', sheriffs' and receivers' sales. Our immense capital of $10,000,000 gives us a tremendous buying power. We buy for spot cash at prices which enable us to pass along wonderful bargains of every kind to our customers.

Corrugated Steel Roofing At Per Square Foot Only 1 1/4¢

This is just one example of the amazing low-price roofing bargains we are now offering. All roofing in this lot is guaranteed clean, brand new stock. Steel Roofing of this grade and weight has never before been sold at anywhere near this price. Be sure to get free samples of this. It will pay you big to supply your roofing needs for years to come because you'll probably never have another chance to get high grade roofing at such a great saving.

Galvanized Steel Roofing Per Square Foot Only 2¾¢

Here is another wonderful bargain. Mind you this is genuine galvanized steel and comes in corrugated, V crimped, standing seam and brick siding, is practically rust-proof, makes an absolutely water-tight, fire-resisting roof—lasts a life time. Price smashed to smithereens on this lot—as low as 2¾c per square foot. Order in quantity lots and save money. Don't fail to mail coupon for free samples.

Rawhide Ready Roofing

As tough as its name. Nothing finer on the market at any price. It is simply impossible to make tougher, stronger, better appearing ready roofing than this. The body is finest quality tough fibred felt, saturated and re-saturated with genuine Trinidad Asphalt—the best, most durable water-proof substance known. The surface is coated with sand, gravel, pebbles, flint, or marble as you prefer. Comes in 1, 2 and 3 ply suitable for any purpose from roofing the finest residence to a hen house. All weights—makes an absolutely storm and water-proof roof—fire and lightning resistant to a high degree. Mail coupon for free samples and freight prepaid prices on this best of all ready roofings.

Get This Free Roofing Book First

Now, then, before you decide upon any particular kind of a roof you certainly owe it to yourself to let us lay our entire roofing proposition before you. Our free roofing book tells you the complete story. You need it. Gives lots of roofing information that you should know. Tells you about the different kinds of roofing materials—which kinds are best adapted for various purposes, their relative cost, etc. Proves conclusively that we can save you **big** money on every kind of roofing. But we will do more than merely save you money. We have the most complete roofing Department of any concern in America in which we employ a number of the best roofing experts in the country. The services of these experts are at your command absolutely free—they will tell you anything you wish to know about roofing and advise you impartially and intelligently. Just write us your roofing needs—tell us the kind of building you are figuring on roofing and about how many square feet of surface there are to cover and our experts will tell you what kind of roofing you should buy, how many squares you will need and will give estimate on total cost.

No Advance Deposit Required

Even if you have no immediate need of roofing, it will pay you to have us lay aside a supply for you to be delivered later—for we tell you frankly that the low prices we are now quoting have never before been equaled and probably never will be. Just state about when you will want your supply and we will hold it out for you without any deposit. Will make immediate shipment if you prefer.

Our Guarantee

You may order any amount of roofing you need direct from this advertisement with absolute safety. Our reputation for dependable merchandise and honest dealings is known from one end of the country to the other. We guarantee our representations absolutely. When you deal with us you can do so with perfect confidence that you will be fairly treated and **always** receive exactly what you order.

SOME NEW ENGLAND PROBLEMS.

Harder than Pioneer Work.

I learned to shear sheep before I learned to clip coupons, to break steers before I broke in clerks; I learned the farmer's tricks before I learned the city man's, to make tallow candles before I saw electric lights. And I know that the city man's tricks are quite as clever as the countryman's, are on a larger scale, and also that they are more difficult of legal proof, chiefly because those conversant with the operations are implicated therein and would incriminate themselves should they reveal them, or if immunized would lose not only their present position, but be unable to secure another in the same or allied lines. Self-preservation being the first law of nature, they naturally remain silent.

It is all very well to urge the Eastern farmer to keep more live stock, to raise more beef, mutton and pork, to turn his idle pastures and waste land to profit; but what will he do with the meat when he has raised it? Sell it, to be sure. Thank you, but where? Why, the "beef men" will take it. Certainly, but at their own price, pleasure and place, or not at all. Then sell it to the markets direct. Capital! But they *will not buy it!*

That is a strong statement and a bit difficult to prove until you try the selling. However, if you know intimately a few marketmen, and have their confidence so that they know you will not quote them by name, you may learn a lot. And here is what I learned from some of them.

I went to a man I know well, and asked him if I could make a three years' contract with him to furnish him all his beef for that time, for 10 per cent below the market, whatever that might be during that period, showing him that I and some associates stood ready to do that and guarantee it by a suitable bond; *provided* that he would sell his beef at five per cent below the current retail price. But not he. He hemmed and hawed, said it would not be as heavy or as mature as Western beef, etc., etc., and when assured that he would have the same or better beef, he backed and filled again. Finally, after much careful and deft questioning, he admitted that should he buy beef from me under such conditions, he could not buy pork and mutton and poultry and lard, etc., at any fair price, or bought, could not get such quality or service as would enable him to hold his trade or do business. And corroborative testimony was secured from others.

Under such conditions, is it at all surprising that the growing of live stock on Eastern farms has become unprofitable?

But such tricks are not confined to city meat interests. Listen to this from the banana trader.

A certain retailer, tired of the dictation (as he considered it) of a big fruit concern, began buying his bananas from a small independent importer. Ere long the latter's supply was exhausted, so the retailer went to the representative of the big concern. The price quoted was stiff, and the quality (number of "hands" on a bunch and size of fruit) below what he had been getting for less. He kicked, but was told to go back to his other source of supply or take what they offered at their price—and, as the narrator, who was the salesman for the big company, said to me, "he would get it when we got good and ready to send it to him."

Perhaps you are not interested in turning waste land into beef, and care not a bit about the banana trade, and are content to raise French turnips on

A FAMILIAR TYPE OF NEW ENGLAND COUNTRY HOME IN SUMMER.

your thin soil. Very well, but what can you sell them for?

One New England farmer did raise a lot of those turnips, and he scraped them and washed them and assorted them to uniform sizes to each sack and sent them to "the most reliable commission house in the city." They sold fast enough, in fact, so fast that the farmer's son—who chanced to have a city position, though living on the farm—was suspicious. So he did up a few turnips in a package, made a canvass of the commission houses, and could not get an offer of even as much as the first house had made returns at. Then he took his samples to a big retail store and talked to the buyer, showed him the samples, explained that all his crop was of equal quality, that it was put in sacks with turnips all of a size in a sack. The buyer was interested, but was well stocked just then; however, would like a price. "Seventy-five cents a bushel," said the farmer's son. "I only paid *seventy cents* a bushel for those hundred sacks there." And those sacks had that son's father's tags on them and he had received a return of *forty-five cents* a bushel, less 10 per cent commission!

Get that buyer to testify in court as to what he paid? Not much. His business was to keep the store supplied with vegetables, and he would not hazard that and his position by talking. And the farmer's son knew it.

Does it stop there? I am told not, but do not know from experience, and being a man with a family to care for, I am decidedly disinclined to learn by experiment. It is said to go as far as this: If you are alone, not a member of some "housewives' league" or similar body, and do a bit too much talking or kicking, you find yourself in a sense "boycotted" by the retailers. You get inferior goods, higher prices and poorer service until life becomes a burden. How can it be remedied? Do not ask me. I am not a doctor of political economy. I am merely a reporter. LAWRENCE COLBURN.

DEVELOPING AN OLD APPLE FARM.

We have in our possession an abandoned farm about 20 miles distant from our home. It contains about 80 acres, and not more than 20 acres could be cultivated with profit, though there is some low meadow land besides. The rest is pretty rough and broken, some woodland and some land that should have wood on it. There are a few scattering apple trees, and the fruit seems to be of better quality than we get here, being very highly colored. A good nine-room house and a barn (which needs repairs) comprise the buildings. It is six miles to a good market and about two miles to a railroad station. If we went there ourselves I should stock up with a team, two cows, a few pigs, etc.; would clean the rubbish out of the woodland, save the best young trees and sprouts, and reforest some rough land; plant fruit trees and keep hens or pigs among the trees, if the spraying did not interfere; also try out some small fruits and garden truck. Would it be practicable to find a tenant who would take any interest in building up the place working at permanent improvements instead of paying cash for rent. What arrangement could be made with such a one, and what inducements held out of future reward, etc. C. S.

Bridgeport, Conn.

It is doubtful if you can find a satisfactory tenant for such a place. From the statement given no man could hope to make more than a bare living on such a place until fruit came into bearing, and that would take several years and considerable expense. For at least five years the man on such a place would have to put much of his labor into "future"—that is with small hope of returns until orchards or small fruit were old enough to give returns. The ordinary tenant who would take such a place could not afford to work in this way and then perhaps lose the results of his labor. In order to develop such a place we think you will have to hire a good farmer to do the work and this will prove expensive—perhaps more so than the place is worth. We do not wish to discourage anyone but having been through something of this sort we know what it means.

FURTHER CRITICISM ON MIXING CONCRETE

From our experience I think Maurice E. Kent's criticism of R. P. C. on concrete mixer, on page 43, is justified, especially if cinders were used instead of stone in the mixture, as it is very doubtful if such a machine would keep the heavy part of mixture in suspension. Mr. Kent's suggestion that a mixer should be of sufficient size to use one bag of cement in each batch is a good one. His further suggestion that where a small job of concreting is to be done, the work can be done more economically by hand than to build a machine is a good one, but with the suggestion that a satisfactory home-made machine cannot be built at a moderate price I cannot agree with, as experience here has proven the contrary.

We procured a piece of double-strength 1½-inch pipe of sufficient length, went to a junk yard and found several old bearings and a pair of heavy gears from an old mower, reducing about six to one. The ends of pipe were trimmed off to fit the bearings at a local machine shop, and a plug fitted in one end. Several holes were drilled in pipe near centre for admitting water to machine while in operation, an old keg being used to gauge water for each batch. A short piece of pipe was screwed into lower edge of keg and a piece of ¾-inch pipe extended a short distance into end of pipe opposite plug. The drum was made of 2-inch oak plank, about two feet in diameter. These planks were fastened together and sawed round, then fastened to pipe shaft by an iron flange, which is set-screwed to shaft and bolted to end. No. 10 sheet iron is screwed to two-inch oak ends with lag screws, the drum being about 30 inches long. A portion of shell about one foot wide is left loose for filling and discharging mixer, this cover being held in place by several studs, with taper keys driven in outside.

AUTO HAULING SIDE DELIVERY RAKE.

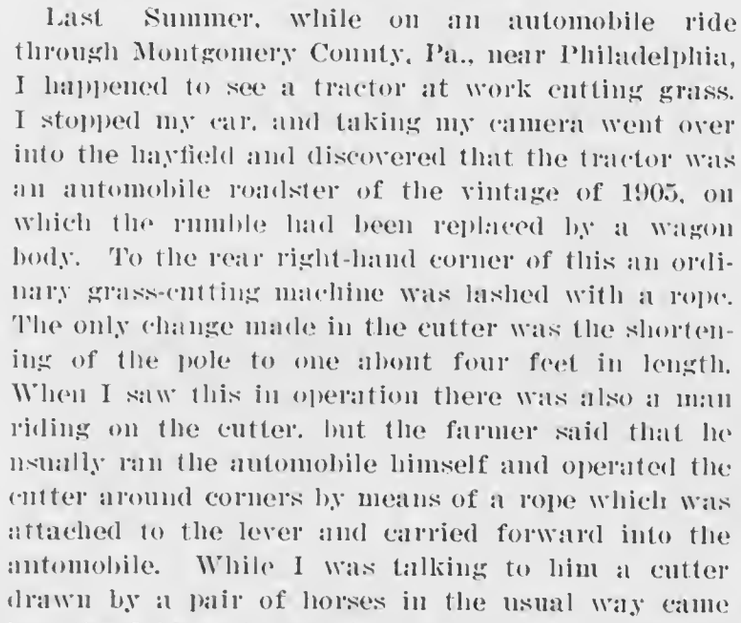
The frame is of oak and the old gear has bearing on frame.

Several such mixers are in use in this neighborhood by farmers who have a 2½ to three horsepower gasoline engine. They move from one farm to another, doing a good business in laying concrete. The expense of construction ranges from $15 to $30, according to the mechanical ability of person building same. From personal experience I know they are satisfactory. These men charge about $4 per day for their own time and machine and $2.50 for the help they employ, general laborers' wages being in this section 15 cents per hour and board themselves. ELMER J. WEAVER.

Lancaster Co., Pa.

HAYMAKERS IN MOTOR CARS.

Last Summer, while on an automobile ride through Montgomery County, Pa., near Philadelphia, I happened to see a tractor at work cutting grass. I stopped my car, and taking my camera went over into the hayfield and discovered that the tractor was an automobile roadster of the vintage of 1905, on which the rumble had been replaced by a wagon body. To the rear right-hand corner of this an ordinary grass-cutting machine was lashed with a rope. The only change made in the cutter was the shortening of the pole to one about four feet in length. When I saw this in operation there was also a man riding on the cutter, but the farmer said that he usually ran the automobile himself and operated the cutter around corners by means of a rope which was attached to the lever and carried forward into the automobile. While I was talking to him a cutter drawn by a pair of horses in the usual way came into the field, and started to work back of the automobile. Before the round of the field had been made once the automobile had come up behind the horse-drawn cutter, thus demonstrating that it was cutting twice as fast as the same size of machine drawn by horses. The operator told me that he used ordinary air-filled tires, and in fact the automobile was a regular pleasure vehicle, and on Sundays he removed the wagon body and put back the rear seat, and took the family out for a ride, while during the week he made daily trips to the station with milk and produce loaded in the wagon body.



MOWING BY AUTO POWER.

Passing along the same road about 10 days later I saw him in another field, and this time he had a side-delivery hayrake attached to the automobile in the same way, which he was operating by himself, and he told me that the day I had seen him with an extra man on the cutter was the only time he had used a man during the season. This might prove a valuable suggestion to those of your readers who own automobiles and find themselves short of help during the haymaking season. B. S. M.

New Jersey.

DOES CORN GROWING PAY?

Do you consider it more profitable to raise corn, or is it better to raise other crops and buy the corn? J. G.

Cheshire, Conn.

It depends upon the other crops which you grow, and the live stock which you intend to keep. It is doubtful if ordinary corn will pay to sell as grain in the Eastern States. Western corn is largely brought into the Eastern markets, and now corn from South America is being imported. We figure that we can raise grain in an ordinary year for just about what it costs to buy in the market, and that we have the stalks for feeding in addition. Formerly when corn was cheaper we found it better economy in our own locality to raise sweet corn, sell the green ears and feed the stalks. The cash return from an acre of sweet corn would usually buy more grain than we could raise on an acre of field corn. In addition to this many varieties of sweet corn enabled us to grow a double crop on the same land, or at least to have a longer period of growth for a cover crop following the corn. Where one is keeping cattle, the corn crop should not be given up, for there is probably nothing which can be grown on our Eastern farms that will give more cow food to the acre than a well-grown crop of Indian corn. If it can be put into the silo, so much the better.

In figuring this value you must consider a good many things. What will it cost you in cash to buy the grain and fodder which the acre of corn produces? That will show you what you must grow in potatoes, garden crops, or other products to offset the acre of corn. Then figure the cost in labor and in money to grow both crops. Find out how many acres of corn one man can care for as compared with the other crops when using improved machinery. Also consider another thing: the value of corn in its effect upon the ground. Where one is plowing a sod, or plowing under cover crops year by year, there is probably nothing quite equal to the corn crop for its mechanical effect upon such soil. Corn grown after a sod, and properly worked, fits the ground admirably for potatoes or other farm crops, which are not so well adapted to sod. Thus it appears that this is not a general question, but one which must be figured out by the individual farmer. We know a number of farmers who still continue to grow corn, largely because they have always done so, and because other farmers do, yet it would be easy to figure out from their returns that potatoes and similar crops would pay them far better. In our own case we gave up growing corn during the time of cheap prices, and have now come back to growing it because the figures proved that it paid to do so.

MORE ABOUT THAT "PROGRESSIVE SON."

On page 138, in an article by W. J., are some very peculiar statements if they are true. W. J. perhaps would be willing to give some further information. Who paid for the young man's education? Is there any mortgage now on the home farm? Did he spend his vacations at home helping with the farm work? What kind of a record did he make while at school? There must be some report cards giving his standing from time to time that would be very interesting. Is the young man efficient in anything? Can he make preparation to grow a crop of potatoes, and grow them according to any method that the authors of the method would recognize?

Has the young man a reasonable amount of plain farm sense? Is he dependable, or must some one else look after all of the many emergencies that happen upon the average farm from time to time? If W. J.'s picture of the father is correct and true he is an odd one among the fathers who have sons who are graduates of an agricultural college. The father may have reasonable doubt as to whether the young man has the necessary energy to keep a manure spreader greased and under cover when not in use. The young man surely made a mistake in not accepting the attractive salary, as taking care of his father is a job too large for him to hold down. If that young man was good for anything his father would be willing to be chore boy for him. UNCLE JOHN.

SOY BEANS AND VETCH FOR ORCHARDS.

About 15 men a day are writing in to us to learn how to handle Soy beans and Winter vetch. Perhaps half of them are orchardists who wish to use one or the other plant, sometimes both. The Soy beans are sown about May 20 to June 1, in drills 28 inches apart, and are cultivated all Summer. At the last cultivation vetch is sown broadcast, and covered by the cultivator. At least part of these orchardists expect to remove the beans themselves, either for grain or for seed, leaving the vines for mulch; that is, spreading them back on the ground. After thrashing, the vetch comes on as a cover crop, and by the 10th of May the ground would be simply a mass of vetch plants, when they will be plowed under giving their great store of nitrogen and humus to the trees, the ground being then fitted and again planted with the Soy beans.

About the only thing that would lack in this programme would be a proper application of phosphorus; then if the ideas of our orchardist friends amount to anything the orchard would be receiving just what it needed, cultivation during the Summer, the Winter cover crops, and the application of nitrogen and humus when the vetch is plowed under in May. If we were going on our estimate, the Soy beans would not remove more than 20 or 25 pounds of nitrogen, and the vetch would all probably add as high as 90 pounds per acre.

A few things have to be learned about growing these two crops. For the Soy beans prepare a real good seed bed; do not sow until the ground is warm, putting them in with a grain drill, stopping what holes you do not need. Apply inoculation with soil sown at the same time through the fertilizer box, using about 30 pounds of seed per acre, cover it very shallow, just barely covering it and no more. Cultivate them three or four times, but do not cultivate after the bloom appears. For New York State use Jet, Mongol, Ito San, or Medium Early Green varieties, our preference being in order named. Inoculation is decidedly important. The beans do not usually find their bacteria, and if they do find them, they will remove as high as 125 pounds of nitrogen from the soil.

Then for the vetches, simply sow in broadcast, or with a one-horse drill, the former being our own method, using 45 pounds seed per acre, sowing not earlier than July 1, and not later than August 20. We prefer to cover this seed half or three-fourths of an inch, and our experience has been that inoculation was very necessary. Some men tell us that they succeeded without inoculation, but we have failed two or three times, until we got the inoculation. Where you do not intend to use these plants in orcharding, the vetch works up nicely sown at the last cultivation of corn, and may be followed with Soy the next year, or may be plowed under in time to sow Alfalfa, or some catch crop, like Sorghum. Some few farmers contemplate growing corn after corn with the vetch plowed under each year. There is worse soil abuse going on than this, but we do not approve of the idea. CHAS. B. WING.

Ohio.

TREES AS "SCAVENGERS OF THE AIR."

The following clipping, cut from a newspaper, sounds to me a little strange. Will you state whether it is true or false?

"If we cross one of our avenues on a hot day when the temperature is 130 degrees Fahrenheit, and pass into the shade of a tree, we are refreshed by the cool air. What makes the change? Not in the shade alone, but chiefly because we are in the presence of a body that has a fixed temperature much cooler than the street. If on a cold Winter's day we pass from the temperature of the street, at zero, into a group of trees, we are surprised at the warmth. This is not only due to the shelter they afford, but more largely to the warmth of the tree, which at 54 degrees Fahrenheit, is 54 degrees warmer than the street. These facts suggest that if our streets are well supplied with vigorous trees we should have much cooler Summers and warmer Winters, as the temperature of the tree never varies from 54 degrees Fahrenheit in Summer's heat or Winter's cold. The tree has the power of absorbing and thus removing from the air the malarial emanations from the street, and from putrefying waste matter, so abundant in cities. In this respect they are the scavengers of the air and protect people from a large number of what are known by sanitarians as 'filth diseases'." C. D. C.

New York.

The clipping you enclose is largely false. Like almost all matter that appears on scientific and technical subjects in the daily press and in many journals, it has a basis of truth. In the first place, it is true that the trees absorb a vast quantity of carbon dioxide from the air during their growth, but, so far as I am aware, this does not prevent any disease, nor is there any disease directly traceable to carbon dioxide alone when taken into the body from the atmosphere as we are doing continually. In no other way are the trees "scavengers of the air." It is also true that when the life processes of the tree are going on during the Summer months, the tree gives off large quantities of water vapor, which possibly you may have noticed descending beneath the trees in the form of a slight mist. I think it is true that this makes the shade of the tree somewhat cooler than would be the shade of a house or an awning. Trees do not, however, warm up the space beneath them, nor is the temperature of a tree at all constant. Those who have had any experience in chopping down trees in the Winter will know that often they are frozen right through the heartwood. In the Winter they are dead to all intents and purposes, and even the absorption of carbon dioxide does not go on, while the Winter is, of course, the time of year when the air contains most of this gas. R. P. C.

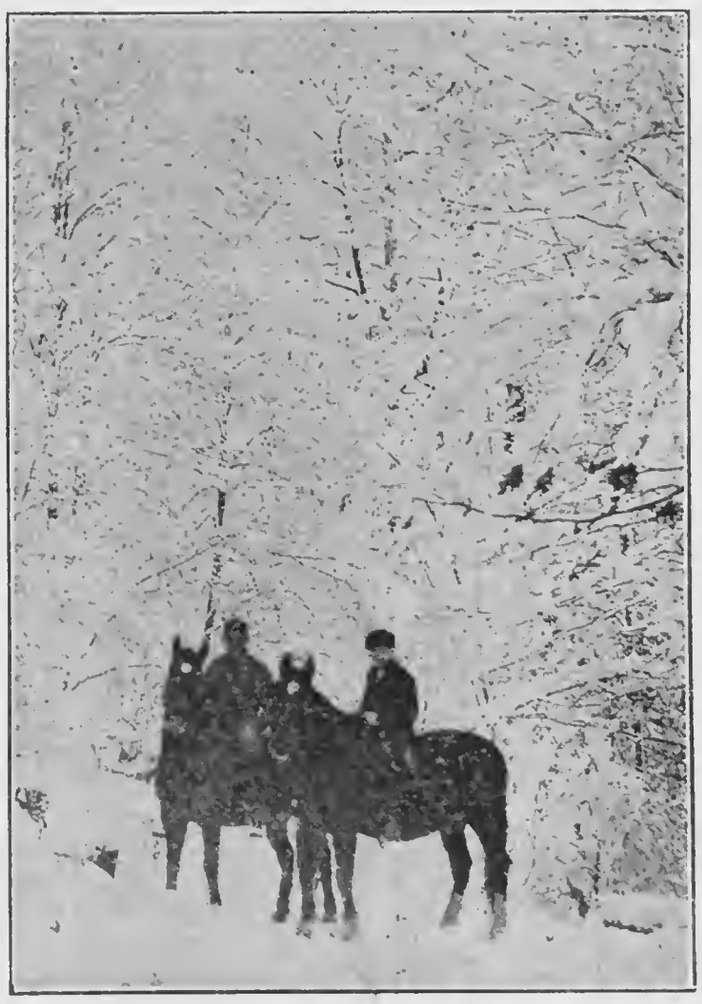
"FARMING ON SHARES"—THE OTHER SIDE.

The article on farming on shares on page 2, is an excellent one and very well written. The trouble with E. D.'s farming was not at all in the method, but in the kind and size of the business, and in the condition of the land and stock when he took the place. Owing to the condition of the farm, a large

ORANGE RIVER, FLORIDA, IN FEBRUARY.

part of his labor went toward bringing it up. For this he will receive no reward unless he stays a term of years. Even so, a farm carrying only 12 cows and having no other source of income; is not capable of supporting two families in any style. They could exist on the income, but they would not be buying many motor cars. In a case like that of E. D. one should not depend on 12 cull cows for an income. The labor income is not large in dairying, even where one has the whole of it. He put his finger on the sore spot when he said: "Lack of capital prevented my raising paying crops, such as potatoes."

In an agricultural survey of Tompkins County, N. Y., it was found that out of over 600 farms, every one of the large producers, had two or more main sources of income, and usually several minor ones. In almost every case, one of the main sources was dairying, and in addition one or more of the following—hay, potatoes, apples, truck, or purebred stock.



WINTER SCENE IN PENNSYLVANIA.

The minor sources included everything else raised in the county. Besides this diversity of products on the successful farms, it was found that these averaged much larger than the average of all the farms in the survey. From 200 to 400 acres was found to be the most efficient and profitable size for the class of farms found in that county. Where these conditions were complied with, the income was satisfactory. In a number of cases where they were not the net result of the farming operations was a loss. Of course more capital is needed to run these profitable farms than the ordinary ones. In the case of E. D. we have a tenant, lacking in capital, who would like to run a farm in an efficient up to date manner. I will now give two instances which show the other side.

Eight years ago I took this place, and from about the condition of the place E. D. was on, I have brought it to a state where it yielded an income of $2,800 and now, having rented more land, I expect to bring the income up to $4,000 or more. The stock, tools and crops, now inventory about $3,600. Besides this, there has been invested $1,000 or more in improving buildings and $500 in tiling. In bringing up the farm, I have had to use good methods of farming. The fact that they were good methods is proved by their working. Having now got the farm on a paying basis, I would like to get some man who could carry the farm on without me, either hiring him or letting it to him. That would leave me free to go to college. What I wanted was to have the man work for me a year or two, to learn my methods and to try him out. I also talked with some tenants, about letting them the farm. I gathered from what talks I had that the consensus of opinion was that it was too hard work to raise my money crop (potatoes) in any quantity, even with my improved machinery, and that it was too much trouble to weigh each cow's milk once a week and put it down for future reference, and also that there was too much red tape in graining cows according to the milk flow. I am still personally conducting the farm.

That this is not an isolated instance is proven by the other case mentioned. There is another farm near here, one of the best in the neighborhood, on which considerably over $1,000 has recently been spent in improvements. The owner would be glad to spend a great deal more if a tenant could be found who would be up to date. So far, however, he has not been found. ALBERT H. DE GRAFF.

Jefferson Co., N. Y.

OMIT THE 90 PER CENT CLAUSE.

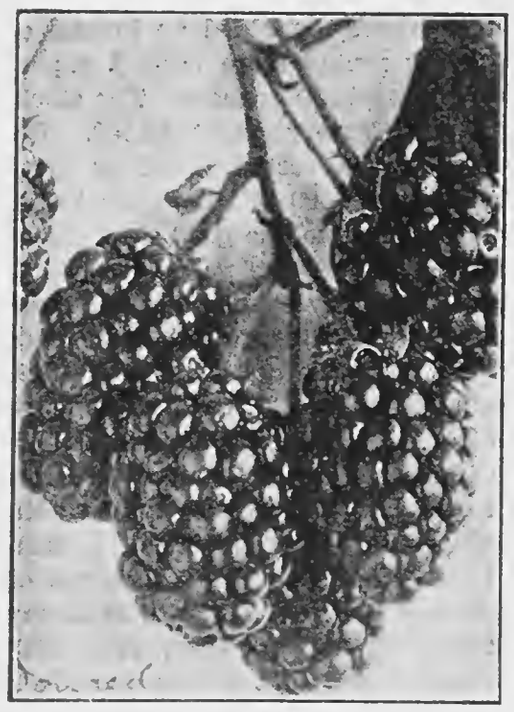
A resolution was passed by the Western New York Fruit Growers' Association at Rochester, January 30, advocating a law, to the effect that "in any barrel of apples packed for market in this State, 90 per cent of the contents shall be as good, in all respects, as those on the face end of the barrel." In other words it shall contain 90 quarts of apples like the face and 10 quarts of something else—it may be cider apples, or stones, or pumpkins. The act of Congress, approved August 3, 1912, and known as the Sulzer law, was a 90 per cent law, and the State act, known as the Wilson bill, was another. The 90 per cent clause makes them all ridiculous. It was probably intended to provide for unavoidable errors, but no apple packer ever put 10 quarts of unavoidable errors in a barrel, and no court would ever fine him for a reasonable amount of such errors, which would be much less than one per cent. We have already too many 90 per cent laws. If we are going to make all apple packers honest by law, let's aim a little higher and make them 100 per cent honest.

With our statute books full of 90 per cent laws, the Teators, the Morrells, the Kings and the Cases, who pack 100 per cent apples, would still be in a class by themselves, and the bulk of the crop would be more poorly packed than now. Small growers can only obtain the higher prices by combining, and having their apples packed and sold by the manager of a central packing house, uninfluenced by either the grower or the buyer, and unhampered by any 90 per cent. law. The proposed law would benefit both growers and consumers if the 90 per cent clause were omitted and the different qualities were packed separately, with the apples in any one barrel *all* alike from top to bottom. HARRY G. CHAPIN.

QUITE a remarkable development is going on in parts of Virginia along Chesapeake Bay. Here in old days many "first families" lived in memorial style. With the passing of slavery and the ruin of the Civil War sad days came to these farms. The land went back to nature or, what was worse, back to tenants, and the proud old houses became feeble and shabby. We hear of one such estate in Maryland which was held for 200 years by one of the proudest families, only to pass into the hands of a colony of Jewish farmers. Some of these estates are now being taken by wealthy Western men. They buy shiploads of lime and train loads of phosphate rock, use cover crops and will in time restore these old farms and make them productive. But those old Virginia houses! What stories could they tell from beneath their new paint and pictures.

FRUIT NOTES FROM MISSOURI.

Several years ago I procured a plant of the Himalaya blackberry. It had cut leaves, and proved not hardy here. Later I bought a plant of the round-leafed variety and last year both it and the cut-leafed endured 5% above zero, and set berries. The round-leafed plant had grown to a very large size, and shown itself hardier than the other. I am told



McDONALD BLACKBERRY.

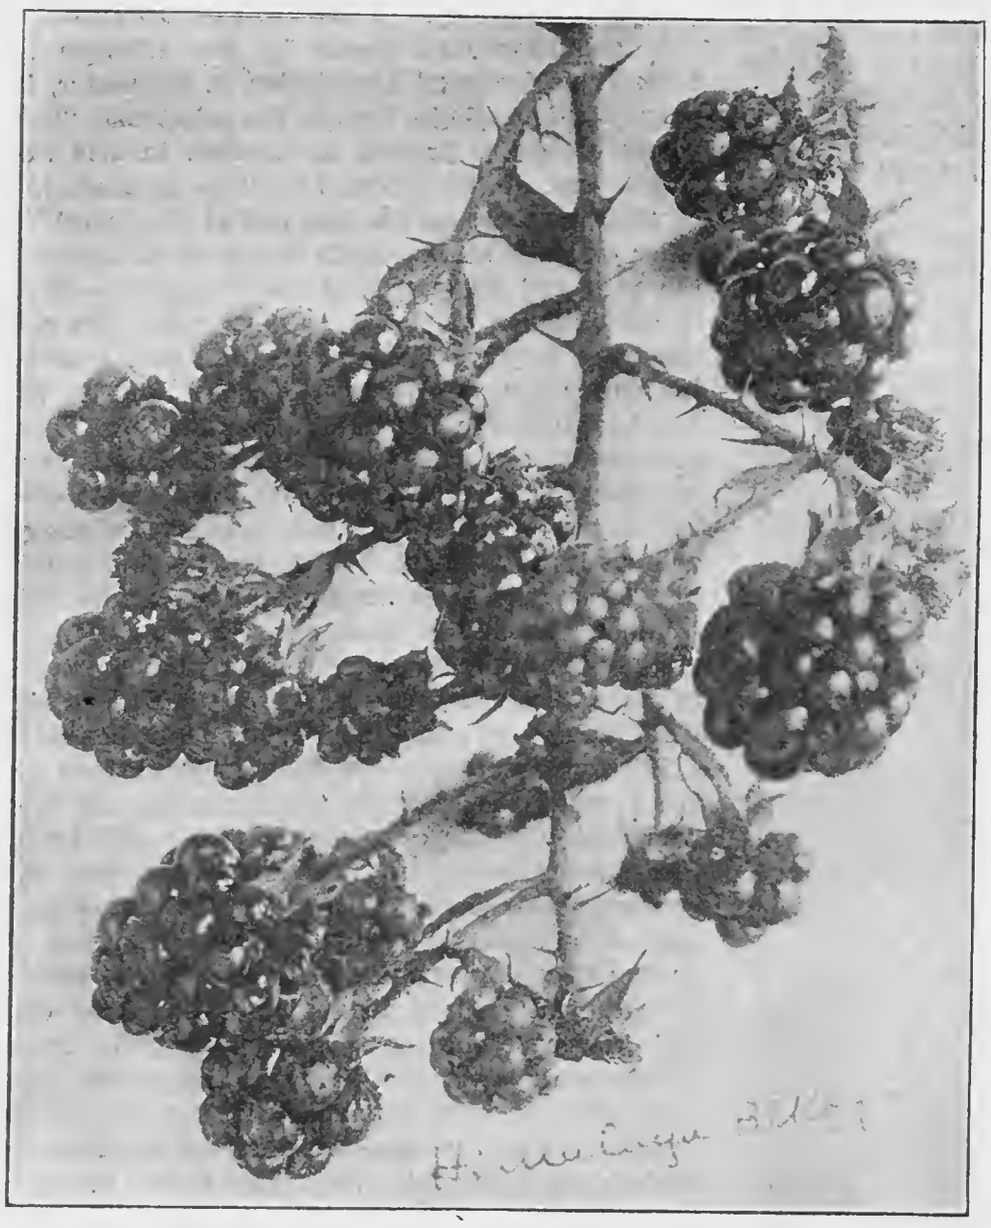
it is hardy in Michigan. It bloomed very late, later than any variety of the blackberry, and its flowers were quite distinct from the rest of its family. They were larger, and tinged with blue. The berries were borne on side shoots that branched out and set many clusters. Its capacity for bearing is obviously enormous. So far, all well and full of promise, but when the berries ripened, then came the disappointment. They were mostly nubbins. The picture shows one of the best clusters, natural size. The flavor of the berries was more acid than that of the standard sorts. Though a disappointment in results, the Himalaya was not a surprise in its fruit. It corresponded closely with reports that I knew were authentic, and they were all to the effect that this variety is not of any commercial profit, at least in the Northern and Central States east of the mountains. I understand that in California it is valuable, and one can easily believe this to be true of any region where this giant plant brings its berries to full perfection. There seem to be several members of the blackberry family whose flowers can be pollinated only under certain climatic conditions. No other member of its family blooms late enough here to act as cross-pollenizer. My plant is trained right and left on two wires, and has a total spread of 25 feet. If its

Another member of this family that I wish to report upon is the McDonald, a hybrid blackberry-dewberry from Texas, a State that leads all the Union in originating new fruits. I sent notes of this berry for 1912, and rated it as one of the most promising of its family. In season it is even a trifle earlier than the Early Harvest, our standard of earliness; in size of berry it exceeds that variety and equals our best mid-season kinds. In productiveness it is not excelled, if equaled. Its berries resemble those of the dewberry, and are of good quality. In growth it is very vigorous, creeping the first year, but afterwards sending up strong canes that will grow eight or 10 feet long. Off my one old vine, thinned to two main canes, I picked five quart boxes of large berries. The largest of these are as large as the biggest dewberries. In Texas I am told it is tremendously productive. So far it has shown only one weakness, and that is deficient pollination. The first year or so some of its berries were nubbiny but this year they were quite perfect. In explanation, the improvement is possibly due to the closer neighborhood of the Harvest and some of its home kindred that are supposed to act as pollenizers, such as the Dallas, Sorsby and Austin dewberry. Next year I shall have a complete test, for I shall have a number of the McDonald growing in rows next to these Texas varieties. If this new claimant proves reliable in bearing, it will at once take its place as the best of the early kinds, and probably the most profitable of all its family. Another hybrid acquired at the same time is the Hampt, but it is thorny beyond belief, and much more deficient in pollination. The Kenoyer is another variety that fails through imperfect pollination.

Why is it that the proximity of a tree is unfavorable to a grape in a dry Summer like the last one, while a blackcap will flourish within three or four feet of a tree whose shade and roots are dwarfing all other growth around it, do better even than if receiving full cultivation in the center of a field? That is the fact here; the blackcap must have shade for best results, and to prevent its canes dying back.

A long spell of warm dry weather is just drawing to an end during which the friable soil prompted a number of people to plant garden seed. This is almost unprecedented here, only 130 miles south of St. Louis. Fruit buds, however, have shown little advancement and are in no danger yet. L. R. JOHNSON.

Cape Girardeau Co., Mo.



THE HIMALAYA BLACKBERRY.

Plant an Apple Orchard

WHEN YOU ARE YOUNG FOR PROFITS WHEN YOU'RE OLD

As you grow older you should be relieved of the hard work and constant attention required to raise grain and stock. *Against that time plant a new apple orchard now.* After a few years the trees will give you heavy crops regularly—and bring you a year's living expenses every fall. Plant at least a thousand *new trees* (on ten acres) this coming April. Use Baldwin, Stayman, York Imperial, Jonathan, McIntosh, Gano, or Yellow Transparent—two only of these sorts.

PLANT HARRISON BERLIN-GROWN TREES

Few other trees equal them. The soil and climate of the "Eastern Shore" makes them bigger and straighter than the slightly stunted trees grown on heavy inland soils. Atlantic gales harden them till they resist winters anywhere. These trees are budded from bearing orchards, and have inbred superior yielding tendencies and abilities.

THESE BOOKS TELL HOW TO PLANT. The Harrison 1914 General Catalogue tells how we grow trees so well. It gives complete planting plans and directions, and gives the facts about varieties. Sent on request. *"How to Grow and Market Fruit"* is sent postpaid for 50 cents. *"The Why and How of Shade Trees and Evergreens"* is sent free on request. Expert advice on fruit problems is given gladly. WRITE TODAY, and tell us about your planting plans.

Allen's Strawberry Plants Bear Large, Luscious Fruit

YOUR success as a fruit grower depends largely upon securing berry plants from carefully grown stock. You are sure of the quality of all berry plants and small fruits when you

Buy Allen's True-To-Name Varieties.

We have all the best of the new and standard varieties. Hardy, prolific plants grown in the nursery with nearly 30 years successful experience back of them. Allen's Strawberry plants will yield bigger, better crops.

All Shipments of Plants Guaranteed to be carefully packed —to be from fresh stock and in good condition.

Allen's Book of Berries for 1914

This book is profusely illustrated and full of valuable Information to fruit growers. Tells how to plant and cultivate Strawberries and other small fruits. It also lists and describes Allen's True-to-Name Blackberries, Raspberries, Currants, Grapes, Asparagus, etc. Every gardener, farmer and fruit grower should have this 1914 Berry Book. Write today for **free** copy.

W. F. ALLEN **72 Market Street, Salisbury, Md.**

The **"JOY" BLACKBERRY**

brings joy to all who grow, sell, or eat it. It is immensely profitable to the market grower, and "a joy forever" to the amateur gardener. The canes are of ironclad hardihood and need no staking. They yield heavily, *all* the canes being literally loaded with fruit every year. I have tested this berry for several years, and am willing to stake my reputation upon it. In the winter of 1911-12 every Blackberry in my trial grounds was damaged more or less *except the Joy*, which came through with every bud and terminal in *perfect* condition.

Grow This Berry. It is Hardy and Wonderfully Productive

JOY Blackberries are coal black, and large, almost as thick through as they are long. In luscious flavor they surpass by far all other Blackberries I have ever grown. In my long experience with this berry its canes have never been affected, even slightly, by orange rust or other fungus disease, and I believe it is immune to them.

A full assortment of Strawberries, Raspberries, Blackberries, Grapes, Currants, Gooseberries, Garden Roots, Hardy Perennial Plants, Shrubs and Vines, Evergreen and Shade Trees, Roses, Hedge Plants, etc. Illustrated descriptive catalog replete with cultural instructions, free to everybody. Established 1878. 200 acres. Quality unsurpassed. Prices low.

LOVETT **J. T. LOVETT, Box 162, Little Silver, N. J.**

THE WESTERN N. Y. HORTICULTURAL SOCIETY.

With some of the most pressing problems of the fruit grower, especially the San José scale and other threatening clouds (which had brought the farmers of the State to these meetings for help and advice) disposed of, and none but the ordinary problems of the fruit industry to come up for discussion, no decline of interest in the proceedings, and surely none in attendance, was to be noticed at the fifty-ninth annual meeting. Every session was well attended, although many members were loth to leave the exhibition annex, which seemed to hold out a wonderful attraction for all. The exhibits were certainly larger and more varied, and the fruit displayed more imposing than ever, even without the fine show of all sorts of fruits which Ellwanger & Barry used to make on these occasions. The young men are coming more and more to the front, and they have taken hold with a will and vim. They have now got into the fixed habit of making their annual pilgrimages to this Mecca of the fruit grower, and have put the society on a safe basis, even financially, in spite of the low membership fee.

In earlier years, a feeble effort was made, now and then, to exhibit a few scattering vegetables. This year, for the first time that I remember, a regular exhibit of garden vegetables was to be seen, made by the Joseph Harris Seed Company. The late Joseph Harris, founder of this firm, was a member and very regular attendant. Pomological (especially apple growing) problems, have always been the chief topics of the discussions at these meetings, and the vegetable growing industry used to find but small and passing consideration. Even up to the last year the round table on vegetable gardening was attended by less than two score members. This attendance was nearly trebled this year, showing that with the elimination of very pressing fruit growing problems the vegetable branch is finding greater attention, and coming into its own.

Mr. Woodward, as chairman of the nominating committee, asserted that much of the wonderful success of the Western New York Horticultural Society was due to the fact that it had good officers, and that these officers were kept, so that the organization during its nearly three score years of existence has had only three presidents and two or three secretaries. The committee recommended the re-election of the entire staff of officers, from president to executive committee, with one or two exceptions, and this re-election was the final outcome. One of the suggestions in President Barry's annual address (and a good one) was that every member should hunt up his copies of the annual reports, for as far back as on hand, and have them bound in a volume that must be very valuable and helpful for reference. The best advice President Barry thinks he can give, is to take better care of the fruit trees, especially during the first five years, as good care during this period is most important. If the trees get a good start, they have the advantage right along. The society's mission, as he sees it, is to bring a bountiful supply of fruit to every family in the State.

Dr. Reddick (Cornell) names apple scab as one of the troublesome diseases which affected the fruit grower in 1913; but says it was the first year in five that the early or first spraying was of primary importance. Raspberry anthracnose was found mostly on black raspberries, and also on the purple Columbian. For this disease the application of sulphate of iron solution, one pound to the gallon of water, made a few days or a week before the buds actually push out, is most important. By one spraying on the dormant wood, and two Summer applications of Bordeaux, made when the new growth is about 10 inches high, and again when two feet high, the disease attacks have been reduced from 90 to 15 per cent.

The so-called Scott lime-sulphur mixture is recommended for peach diseases, but did not entirely prevent peach mildew. The mixture is made by slaking eight pounds of lime and adding, while in process of slaking, eight pounds of sulphur flour, mixing thoroughly, and adding water enough to make 50 gallons.

If any man should be able to give us reliable figures of the cost of an apple crop, I believe the man is Prof. Hedrick of the Geneva Station. On the basis of his experience in the Auchter Baldwin orchards, which he has managed during the past 10 years' period (the orchard then being in the prime of life), he figures the cost including interest at five per cent. on a $500 investment per acre, to be per barrel of fruit 93 cents, cost of barrel 36 cents, together $1.29. The selling prices averaged $2.60 for the firsts and seconds in barrels, and 63 cents for evaporator and cider stock (culls) per barrel without package, giving net returns of $93.74 average per acre per year, or a profit of 18¾ per cent. on the $500 investment. And he expects the orchard to do as well or better during the next 20 years. This, however, is probably above the average, as many are losing, and few are winning. He believes, however, that there is a bonanza close at hand for those who have eyes to see and brain to work.

At the round table talk on small fruits, Prof. Taylor (Geneva) named Snyder as the hardiest of the blackberries, and Ancient Briton and Agawam also quite hardy. Eldorado, although most promising and of large size, is not just yet recommended for commercial planting, only experimentally.

Dr. Wright warns against the use of lime on strawberry patches unless the land is very sour, and against its indiscriminate use for small fruits generally. No bad results have been observed from the use of wood ashes, and on light soils perhaps the effects of the potash offset the bad effects of the lime.

Mr. Hepworth claims to have "only" about 60,000 currant bushes in fruiting. He plants currants in every vacant spot, in his vineyards, young orchards, etc. He objects to Wilder for the reason that it grows all to wood on his land. Six tons per acre is a good crop, but the yield sometimes dwindles down to 1½ ton.

The report on grapes, at the round table talk on that subject, show that the 1913 crop was rather light, but prices high, so that the growers really fared better than in a season of heavy yield. This moved Prof. Taylor to say that a half crop at a high price is more profitable than a full crop at a low price. The cost of growing and marketing an acre of grapes was given as about $50. Some vineyards have yielded three to four tons of grapes. A profit of $100 to $150 per acre looks very attractive. The average price per ton, for the season, was $51.77. The reduced grape crop of 1913 is of advantage to the health and vigor of the vines, so that a good crop can be expected in 1914. Grapes are easily grown even by the amateur, and a succession can be had from August until mid-winter.

Dr. Lipman, director of the New Jersey Station, in his talk on soil fertility, stated that phosphoric acid is usually applied to soils more largely than it is removed by the crops, and this for the reason that it does not circulate in the soil as freely as potash. We can work with a smaller plant food capital in light soils than in heavier ones, because the plant foods move faster in the former. We put organic matter into the soil because we expect from it a contribution to the water-holding capacity of that soil. Usually we do not have rainfall enough to produce maximum crops. Ordinary farm rotation, even with manure returned to the soil, does not maintain the organic contents of the soil for getting maximum yields in quantity or quality. Nothing will stimulate soil bacteria more than soluble phosphoric acid, and nothing is more satisfactory if applied in conjunction with lime. For continued use alone, acid phosphate will make the land more acid. It is not uncommon to find 2½ per cent., and even up to five per cent. potash in some soils, and potash may be needed only because it does not become available fast enough. Soil deficient in available potash is more subject to fungous diseases. Usually the use of potash is more justified in our lighter soils. Acid phosphate applied in small quantities favors the germination of the seed and gives to the young plants a better root system. Land plaster although consisting largely of lime, has not the power to neutralize soil acid. T. G.

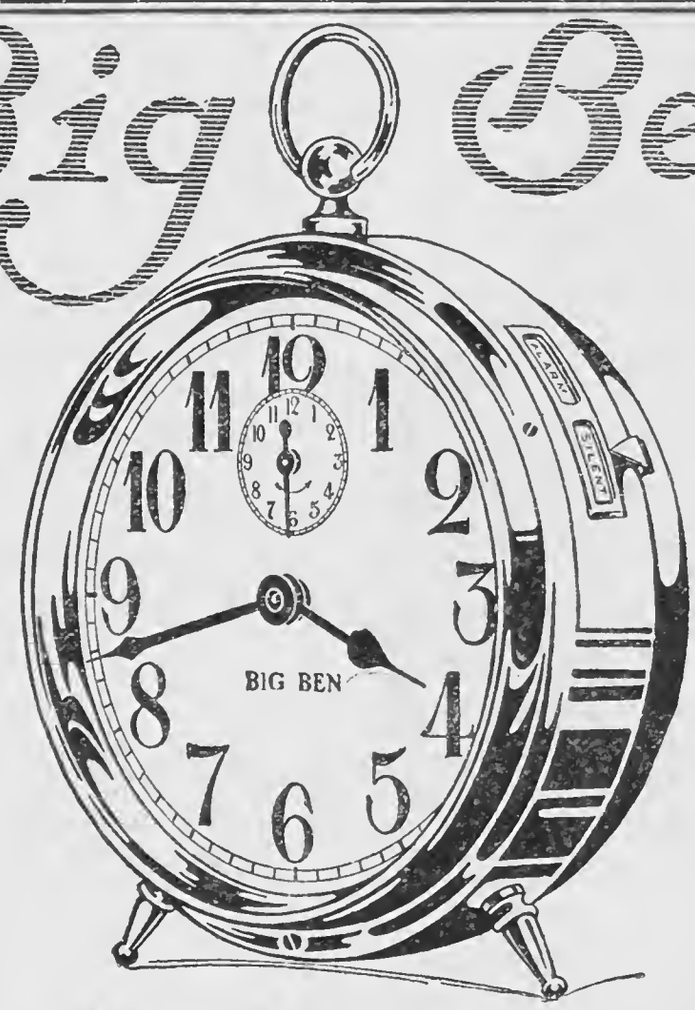
Big Ben



Hitch Your Sleeping Schedule to Big Ben

Big Ben will wake you early enough for profitable before-breakfast action. His gentle get-up *call* starts the day with a *flying start* on thousands of farms.

For your accommodation he rings TWO WAYS. He'll get you up by degrees or in a hurry. Set him either way you wish—to give one long five-minute ring, or ten short rings at one-half-minute intervals, until you're wide awake.

He stands 7 inches tall; is triple-nickel plated over a tested implement steel coat, the handsomest and truest thoroughbred in the clock world. He has big, bold numerals and hands that show the time plainly at a glance, large keys that anyone can wind easily, and such a pleasant tone that you are glad to get up when he calls.

Big Ben makes early rising easy. He's the leader of the early morning brigade. His cheerful "good morning" ring calls millions of live wires to action. Thousands of successful farms are run on a Big Ben schedule. He starts you off right in the morning and keeps you right all day. From "Sun up" to "Lights out" he regulates your day. He'll work for 36 hours at a stretch and overtime, if necessary. The only pay he asks is one drop of oil a year.

He is sturdy and strong—built to last a lifetime. Yet under his dust-proof steel coat is the most delicate "works." That's why his on-the-dot accuracy has won him fame.

Big Ben's wonderful sales are due to his having "made good." His biggest hit has been with folks with the "make good" habit. He stands for success—that's why you'll like him for a friend.

When 3,000,000 families find Big Ben a good clock to buy and 20,000 Jewelers *prove* he's a good clock to sell, it's evidence that he is worth $2.50 of *your* money. Suppose you trade $2.50 for him today.

If your Jeweler doesn't sell Big Ben, a $2.50 money order sent to his makers—*Westclox, LaSalle, Illinois*—will bring him to you in a hurry, express charges prepaid.

Dreer's 1914 Garden Book

New Flowers you will wish to try will be found in its pages.

New Vegetables you will want in your garden are there also.

Cultural instructions for growing everything worth growing, by well known experts, will make gardening easy even for the novice.

Over a thousand photographic illustrations and 10 color and duotone plates.

Mailed free to any one mentioning this publication.

Dreer's Orchid-Flowered Sweet Peas, with immense wavy flowers in sprays of 3 and 4 blossoms each. Just as easy to grow as the common sorts. Our mixture contains a full range of colors. 10c. per pkt.—20c. per oz.—60c. per 1-4 lb. Garden Book free with each order.

E. Frank Coe Fertilizers

1857 The Business Farmers' Standard for Over Fifty-six Years 1914

Do you raise 300 bushels of Potatoes per Acre?

THREE hundred bushels per acre is not an unusual yield by any means, but did you get it this year?

¶ If you were planning to raise 300 bushels of potatoes to the acre how far apart would you space your rows? How far apart would you drop the seed pieces in the row?

¶ How much fertilizer would you use to grow 300 bushels of potatoes per acre? How would you apply it?

¶ Are you sure that your seed potatoes are true to name and true to type?

¶ What are you doing to prevent "scab" and early and late blight?

¶ Did you have a short crop of potatoes because of dry weather? Have you decided how you will overcome this trouble in the future?

¶ All these practical points, and many more, are fully covered in our new book

"Potatoes: A Money Crop"

which will be sent free to every potato grower who requests a copy, and mentions this paper.

¶ This book is written by a man who himself has had years of experience as a potato grower, and who has made a careful study of the best methods of other growers.

¶ If you read this book you will keep it for future reference. It is a "worth while" publication.

The Coe-Mortimer Company
51 Chambers St., New York City

The Home Acre.

Green Crops for Chicken Run.

Let Villager, page 147, try the common wild honeysuckle as a soil binder in his henyard. It is easy to plant, grows fast and nothing will eat it. If his land were moist and cool and fertile he might find the English ivy better. The former does well on poor, dry, warm soil. It stays green all Winter here in the mountains. Bunches of wild "creeping Charlie" or ground ivy thrown into those gullies with a few rocks over them would also be let alone by the average hen. During the hot weather he could grow the "Jack bean" and the "Sword bean" right in his henyard, and the hens would not bother them except to cultivate them. Nothing will eat them, not even a duck. The hens would not even destroy the cotyledons as they come through the ground—might possibly break off one or two in tramping them or testing them.

North Carolina. E. B. H.

Replying to Villager on soil binding growth for henyard, I would suggest trying horse-radish. This is one plant that hens do not seem to touch, and I think if the plants or roots were set out and protected for a time by small stakes driven close aronnd to keep the hens from scratching them out they would soon take care of themselves. Last year the writer had a yard 80x100 feet with about 100 hens in it. Every bit of green was entirely dug out and eaten up except four or five horse-radish plants and two wild Asters; these plants all were of extra strong large growth, and all during the molting season the birds seemed almost to live under the plants. There was plenty of pear and apple tree shade but the birds preferred the big broad leaf protecting shade of the horse-radish. The wild Asters also seemed to be liked by the birds, and filled with blue flowers, which they carried until late in the Fall. They added rather than detracted from the general appearance of the yard. I had intended trying out a full row of the horse-radish, also one of the Asters in the yards this coming season, but will not be able to do so on account of moving into the city. I realize of course that horse-radish grows best in damp places, and that swamp places are not best for henyards, but our place last year was all right for both hens and plants.

"TOWNER."

Irrigation on Sandy Land.

Charles W. Skinner, inventor of a popular system of overhead irrigation, is giving a practical demonstration of the value of irrigation on his South Jersey farm. He came to New Jersey from Ohio and purchased 30 acres of land in Gloucester County; cleared and cultivated and put 10 acres of it under irrigation the first year. It was said of this land that it was so poor that a turtle would starve to death going across it. This was the opinion of some of the natives, but Mr. Skinner had his own ideas, which he expected to work out on this land; and the first season showed that he was doing it.

One of the best streams in this section borders on the back part of this farm, and so there is an unlimited water supply. The power house is placed close to this stream. All the swamp land adjoining the stream is being cleared and tiled, and makes splendid celery ground.

The 10 acres which were first cleared had not been under cultivation for 34 years, so it was rested and ready to respond to the proper treatment. Land needs head work as well as hand work, and this man had an active brain as well as hands. He believes in giving the land plenty of food and water, and the acres in return give back wonderful crops. He started with a heavy application of manure from a nearby city. Celery seed was sown in February, and the plants put in the field the last of April and first of May. This celery was sent to market the last of June and first of July. It was grown in double rows, one foot apart, the double rows being 14 feet apart, with the space between the celery planted in another crop, such as radishes or lettuce.

Most of the 100,000 plants were mulched with manure direct from the car from a nearby station. The team and wagon could be driven astride of the double row of celery, the manure thrown off and placed between and around the plants by hand. Some of the celery was mulched with refuse from potato and tomato crops. The celery thus mulched, and with rain and plenty of irrigation, did well. The varieties grown were Winter Queen, Giant Pascal, Snow White and Golden Self Blanching. The main reason Mr. Skinner puts his double celery rows 14 feet apart is to get plenty of earth to pull up to the plants to blanch them with, and this works his top soil to a depth of 18 to 20 inches.

The one-half acre of Bonnie Best tomatoes were also mulched, as the soil was sandy and believed to be too poor to grow weeds. However, with the manure mulch and plenty of water, the tomatoes yielded almost 10 tons on the half acre, and a fine crop of radishes and good lettuce was raised after the tomatoes, the Big Boston lettuce and radishes were sown at the same time. Stowell's Evergreen corn was planted three and four feet apart, and mulched and irrigated; in fact everything on the cleared land is covered by the irrigation system. After the corn was cut, a fine crop of lettuce was raised on the ground.

There was one acre in potatoes, Irish Cobbler and Early Fortune, 28 inches apart in the rows. The yield was 400 bushels of prime potatoes. Two-thirds of an acre of red onion seed was sown in April and taken off in August. Celery plants were put between the rows in July. A crop of endive was also grown, which was banked and bleached and sold for 40 cents a pound. It averaged about one-fourth pound to a stalk. In a dry season the thrips often ruins an onion crop. This was overcome by the use of nitrate of soda in solution, put on through the irrigation system.

One of the prettiest crops was the cantaloupes, 48 hills in a row, and 48 rows and of as fine quality as Jersey ever grew; 2,800 baskets were sold. A good leaf growth is necessary for a sweet cantaloupe, and the effort was to produce this growth. The aim was for quality and not for quantity.

The future development of agriculture in the East lies in the utilization of every resource, in which irrigation is an important factor. We know what irrigation will do, and we need now to study the systems and apply them where suitable conditions can be found. Mr. Skinner has rebuilt his house and barn and the same water supply and power that waters his farm is used in the house and barn. C. J. S.

Controlling Potato Bugs.

I had an unusual but pleasant experience last season with my potatoes. I would like to know how to continue it? I haven't had a potato bug during the whole season. While the previous year on the same ground I had many quarts of them. I caught them in a pan containing kerosene and burned them. Can you tell me how to continue my good luck in the future? W. T.

We should look for good luck, as you call it, where you found it before. You cannot expect to be entirely free from the potato bugs except now and then in some season when the weather conditions will destroy the eggs. You must prepare to fight these bugs one year with another. On a small patch your plan of knocking them off into a pan of kerosene will answer. In larger farming, of course, such work will not do. The bugs must be killed in some way in a wholesale manner. This is usually done by spraying or dusting the vines with a carrier which contains arsenate in some form. The liquid spray is made by mixing or dissolving the poison with water, and spraying it over the vines, just as the potato bugs appear. In the dust method the poison is mixed with plaster, flour, lime, or even road dust, and sifted over the vines while they are wet with dew. The object in either case is to induce the potato bugs to eat the poison as they gnaw at the leaf of the plant. As these bugs are leaf eaters this method of killing them answers. With the suckers, or insects which bore into the leaf or stem, and suck out the juices, the poisons will not answer, but a spray of oil or some caustic substance is needed to kill them by contact from the outside.

AN INEXPENSIVE GREENHOUSE.

PART II.

TOMATOES.—If a crop of either radishes or lettuce is about one-third grown about March 15, and you have good stocky tomato plants in three-inch pots, or three-inch square dirt bands, they can be planted in beds about 16x18 inches each way, and will make a slow sturdy growth while the former crop is maturing. For dirt bands we have a printer cut out strips 3x14 inches of about No. 12 manila paper, then take a block three inches square and fold round same, and pin together, this makes a band three inches each way and costs less labor of folding, about $1 per 1000, and is an excellent device to grow tomato plants in. The plants should have been transplanted once before being planted in these bands. Bonny Best, or Crackerjack, we have found the most desirable for forcing. They are both good size, (the former the larger), smooth, and heavy producers, each variety setting fruit easily indoors during April and May.

TEMPERATURE.—As soon as the radishes and lettuce are out of house and tomatoes are in bloom, do not water too heavily or frequently, allowing soil to dry out slightly between each watering. Keep temperature higher, 60 deg. to 65 deg. at night and 10 to 15 deg. warmer during bright days is about right. Do not fertilize with nitrogen during blooming period, rather use potash and acid phosphate in available forms.

POLLINATION AND TOP-DRESSING.—Each day pollinate blossoms by tapping plants lightly with a stick padded with cloth at end, so as not to bruise the plants. When fruit is set in four or more clusters some growers top their plants, so as to get into market ahead of the outdoor grown tomatoes. As soon as a good lot of fruit is set, increase the allowance of water and sprinkle a mulch of fertilizer over beds. We use the formula mentioned for radishes for this purpose, applying at rate of ton per acre *and water it into soil, never loosen up the soil on benches for this purpose as a lot of feeding roots will be destroyed.* This may seem contrary advice, but is borne out by experience that cost us many bushels of tomatoes, as every time we have tried cultivation we have invariably lost one to two entire clusters of bloom. When fruit is expanding rapidly water should be given daily, on every other day at least. If this is not attended to regularly, black rot at blossom end of fruit is almost sure to set in, a trouble that is caused by dry soil, or lack of potash or both, and possibly no other cause either indoors or outdoors. Tomato plants that are to be set in benches March 15 should be started January 1, or better December 15, and transplanted once; then on second transplanting into pots or dirt bands you will have fine, sturdy plants.

TYING UP.—As soon as growth commences when plants are placed in permanent bed, supporting should be resorted to. Fasten a binder twine or two-ply jute firmly to top of house, and fasten lower end very loosely to base of plant, and as plant grows simply twist it round the string. This is a simple and very satisfactory manner of support. Each plant should be trained to single stem, and all suckers removed as soon as they appear. If growth is too dense the ends of leaves may be removed so as to allow sunlight to reach fruit. Tomato plants should be sprayed with Bordeaux mixture every week or two, till fruit is large enough to be discolored; 4-6-50 formula is right. When fruit is large size we use fungine, purchased from seedsman.

MARKETING THE CROP.—You may think you have no market, either for radishes, lettuce, or tomatoes, but produce a good quality of each, or either, and take them to the storekeeper from whom you purchase groceries, etc., and you will be surprised how soon you will have a good demand for more stock than you can grow.

PLANT GROWING.—If growing vegetables does not appeal to anyone there are many other lines open, vegetable plants being sold in our community by tens of thousands each season, as many farmers and village residents regularly purchase their plants in preference to trying to grow them in warm rooms, a practice which makes, usually, crooked, anemic, yellow plants. Tomato plants are greatest in demand in this section followed by cabbage, lettuce, cauliflower, eggplant, pepper, celery, sweet potato, etc. Tomato, eggplant, pepper, require the warm parts of the house, and the other plants the cooler portions. Flats are usually used for this purpose, made by purchasing boxes about 12x18 inches or some size near those dimensions, and saving them in such manner that the finished boxes are about 2½ to three inches deep. A few holes or cracks should be in bottom of each flat for drainage. The plants should be transplanted into these flats about 1½ to two inches each way, and in this manner are easy to take to some store for sale, as they will easily stand a week or more if unsold. A good rich soil should be used but not too rich, and as soon as plants are making a nice sturdy growth, withhold water so as to harden them off. You want to avoid a long soft growth, which is not desirable, as a tomato plant six inches high and of a dark green color is much more desirable than a light green plant 12 inches high. Cabbage can easily be hardened off, and placed in a cold frame March 1, and lettuce can be sown in the Fall and given slight protection during Winter.

Flowering plants may appeal to some in preference to vegetables, and a good trade can undoubtedly be worked up along this line, but as my experience has been entirely with vegetables and cut flowers, I do not feel qualified to give information on this end of the business. A low narrow house, such as has been described is not very well adapted to growing cut flowers, though I have seen good quality grown in such houses. ELMER J. WEAVER.

Plowing Soil for an Orchard.

I have a number of acres of old meadow land and an acre or so of old land that I wish to set out to peaches in the Spring. It is a clay soil with a gentle western slope, and good drainage. It has not been plowed in a number of years, and has not had a great deal of manure. Will you advise me just how to go at this proposition, as I have never had any experience with peaches? I wish to know just when and how to plow this soil. Would you advise subsoil plowing in dead furrows for the trees? F. L. J.

If that soil is heavy clay loam, plow as deeply as possible without turning up too much subsoil; as early as bottom of furrow will crumble without packing when squeezed in the hand. Double disk to keep level, and finish with a smoothing harrow. Soil should be mellow and moist with all of the Fall and Winter rains stored in soil and subsoil. This is the most important factor of all, for if dry weather follows trees will not be stunted, which they certainly would be if dry weather followed setting in a dry poorly prepared soil. Your idea of plowing in narrow lands, subsoiling dead furrows and setting will perhaps make setting of trees easier, but care should be used to get furrows straight. On that type of soil I would set trees 20 feet each way; yearling trees cut back to two feet are best. I would drill or broadcast 500 pounds of 2-8-10 fertilizer when fitting land; beans or an early small variety of flint corn may be grown. I would not plant them till about June 1, using a harrow between tree rows till then, then planting five rows three feet apart, leaving a four-foot space next to tree row. Clover seed sown at last cultivation will make a good cover crop to plow under the next May. I would not double-crop after third year, but cultivate till about Augnst 1, then sow cover crop. Oats sown thickly about Augnst 10 make a good growth if you object to a crop that lives through the Winter. The New York Agricultural Experiment Station at Geneva has found that fertilization did not show any results on their clay loam apple orchards, therefore if your trees make good growth after trees occupy whole land probably cover cropping alone will be sufficient. Good yearling trees should be obtained for about 10 cents each and it would be well to go to a nearby nursery and personally select them, and be guided somewhat by their advice as to varieties. For in your location varieties tender in bud will often winter-kill, and espeeially if your soil is really heavy, as much of the soil in Seneca County is.

Sixteen of the World's Greatest Fruit Men Wrote This Book

THESE AUTHORS are numbered among the foremost pomologists of their time. National and State governments, leading educational institutions, pomological societies and fruit growers everywhere recognize them as *authorities* in their chosen field.

These distinguished men now unite their efforts in paying tribute to "the finest apple the world has ever known." Their words constitute a wonderful memorial to a *masterpiece* that represents the combined work of nature and mankind.

The result is a notable little volume—one that ought to be in the hands of every fruit grower.

No higher compliment was ever paid to a fruit variety than the symposium of praise which these trained fruit men and able writers have prepared.

We want the world to have this book—*free*. It is not put out as an advertisement, but as evidence of appreciation of the remarkable support we have had from fruit growers in every clime, and as a testimonial to the points of perfection which have established Delicious in a class having no other member.

Besides an introductory chapter by the Hon. Champ Clark, there is a chapter entitled "The World's Best Apple," by Jesse Hiatt, who discovered the original Delicious tree on his place near Peru, Iowa.

Then there are able chapters by such men as Col. G. B. Brackett, pomologist of the U. S. Department of Horticulture; Prof. H. E. Van Deman, Ex-United States pomologist; Luther Burbank, the "Wizard of Horticulture"; E. P. Powell, a noted authority and writer; Richard Dalton, president of the Missouri State Board of Agriculture; Prof. Wendell Paddock, of Ohio State University; J. C. Whitten, Dean of Horticulture in the University of Missouri; Prof. E. P. Taylor, of the University of Idaho; Thomas F. Rigg, editor and experimenter; Harold Simmons, of Minnesota; Dr. Sumner Gleason, originator of the Stark Early Elberta peach; James Handly, Secretary of the Mississippi Valley Apple Growers' Association; Joseph Gerardi, of Illinois; H. M. Magie, of Virginia: Frank Femmons, of California; Silas Wilson, of Idaho.

"The Story of an Apple"

One of the features of this book is a complete historical chapter by the president of Stark Bros. Nurseries & Orchards Company, giving a detailed account of the discovery, development, introduction and propagation of Delicious.

You may have a copy of this splendid book by merely asking for it.

Please use the coupon and address Stark Bros. Nurseries & Orchards Company at *headquarters*, Louisiana, Mo. Send no mail to individuals.

It's a Pleasure to Farm in the South

NATURE coöperates with you at every turn in the Southeast. Crop failures are hardly known.

You are favored with 200 to 300 growing days, which allow two and three crops from the same land each season.

Expensive irrigation is unnecessary, as 45 to 60 inches of rain, well distributed through the growing season, fall annually.

The assortment of crops raised in the Southeast is the greatest anywhere in America. From the tropical citrus fruits to the finest varieties of apples, peaches, pears, grapes and numerous other fruits and nearly every known variety of grains, vegetables, grasses and legumes can be produced somewhere in the Southern Railway territory.

And with all these superior advantages Southeastern land now averages less than one-half the price of farms in other parts of America.

$15 to $50 An Acre Buys Excellent Homesteads

where the climate is exceedingly agreeable and healthful, where railroad communication is of the highest order and transportation to Northern markets but 24 to 48 hours. Life in the rural sections of the South is all that could be desired. Modern highways and telephones, the best of high and agricultural schools, good churches and trading centers—all these advantages are to be had in this growing section.

INVESTIGATE SOUTHERN CONDITIONS

Avail yourself of the low Homeseeker's Rates. Write for particulars. Learn of the favorable conditions in the South. Ask for the "Southern Field" magazine, state booklets on Virginia, North or South Carolina, Georgia, Florida, Alabama, Mississippi, Tennessee and Kentucky. Let us know the state and line of farming in which you are interested.

M. V. Richards, Land and Ind. Agt. SOUTHERN RAILWAY Room 87 Washington, D. C.

Mobile & Ohio R.R. Southern Ry. Ga. So. & Fla. Ry.

Low Price of Sweet Potatoes.

Our section will be half a million dollars short this year by reason of prices on sweet potatoes. That means hardship for they use from $15 up per acre of fertilizer. Our Italian farmers, where father and the whole family works, have the advantage. Why is the price so low?

Vineland, N. J. G. H. M.

It is hard to say definitely just why sweet potatoes should be so low at this time, but I am inclined to attribute it to a combination of conditions rather than to any one thing. The final estimates of the Department of Agriculture place the production of sweets at 59,057,000 bushels in 1913 as against 55,479,000 bushels in 1912 and 54,538,000 in 1911, showing an increase over last year of three and one-half million bushels. This larger yield has undoubtedly had some effect on prices, but in all probability the effect on the market from that source is not nearly so great as from the fact (brought out in recent New York reports) that many sweets, especially from the South are arriving on the market poor in quality and in bad shape. This is demoralizing, and helps to bring the price of good stock to a lower level. From several local points reports have come saying sweets were not keeping well and that they were being marketed to avoid further loss and shrinkage. If this is quite general there is no doubt that the market is affected from this source also. Then too, there is again the question of unequal distribution, and the many others that enter into marketing produce of all kinds.

Just now everything seems to be conspiring against the sweet potato grower, but being a Jerseyman, I am inclined to look on the bright side of the matter. Sweets have been low before. My father tells of a time, some 25 or 30 years ago, when he carted sweet potatoes 2½ miles over a sandy road, taking only 12 barrels at a two-horse load, and received 80 cents a barrel for them. And the barrels held just as much then as they do now. There was also a period of low prices for sweets between 1892 and 1896. There was one season at that time when sweet potatoes sold in the Fall for 50 to 60 cents a barrel. A neighboring grower did not wish to sell for those figures at digging time, so stored a good portion of his crop in a vacant room in his dwelling. But prices did not go up, and he took them out later for 40 cents a barrel, and lost considerable through shrinkage. Sweet potato growing at that time was certainly no get-rich-quick scheme, and many said that the Jersey grower would no longer be able to compete with the South. But since then there have been many good years for the sweet potato grower, and the Jersey sweet potato has come to be a greater factor in the market than ever.

A recent New York report says "Sweet potatoes plentiful and the market gradually declining under a very dull trade; Jersey No. 1 were quoted at $1.50 to $1.90 per barrel and Southern at 75 to $1 a barrel." Such a report as that is certainly not very encouraging for the man with a large bin of stored sweets. But it does show that the consuming public is willing to pay almost 100% more for the Jersey sweets, and if the sweet potato growers are going to be driven out of business because of low prices, the Jerseymen will certainly not be the first to go. I believe the man who can grow a crop of sweet potatoes, and who has grit enough to hold on, will find that the law of averages will square things up for him in the long run no matter where he lives, but if he hails from Jersey the "long run" will be a "jiffy."

TRUCKER, JR.

Importance of Spraying.

I have an orchard of about 1,000 apple trees 15 years old. I cannot find any San Jose scale on them this Winter; have been spraying them with lime-sulphur, using a power sprayer. I wish to know if it is best to omit the dormant spray or will it pay to spray anyway for scab and fungi? E. T.

New Jersey.

We should spray on general principle, whether you can find scale or not. This is the safe way to be sure of good fruit. We skipped spraying one year when scale was not visible, and lost 10 times the cost of spraying.

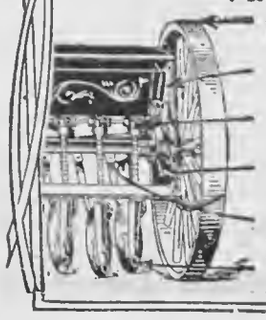
Bigger Crops—Better Grain—Less Seed
VAN BRUNT DRILLS

Famous for accurate feed, correct covering, light draft, light weight and durability.

These features made Van Brunt famous



- Wheels always stand true.
- Hopper trussed—don't sag.
- Adjustable gate force feed.
- Bearings extend under frame.
- Adjustable spring pressure.
- Every seed at bottom of furrow.

Every grain grower should investigate the new and improved features of Van Brunt drills. The adjustable gate force feed, the successful fertilizer feed, the non-chokeable disc openers, the trussed hoppers, the light weight, the light draft,—all of these features combine to make the Van Brunt famous wherever introduced. Don't seed another crop with a poor drill.

Book Free

Every grain grower should have our new drill book. The improved features of Van Brunt drills make them most desirable. Write and ask for package No. VB 33

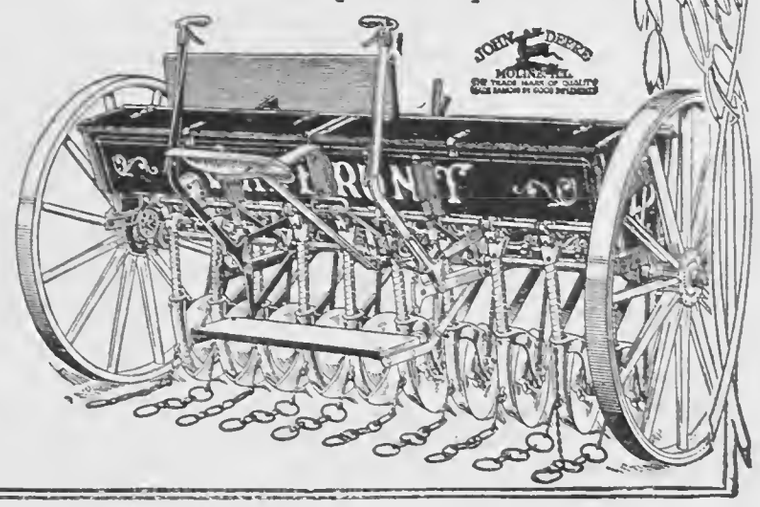
MOLINE, ILLINOIS

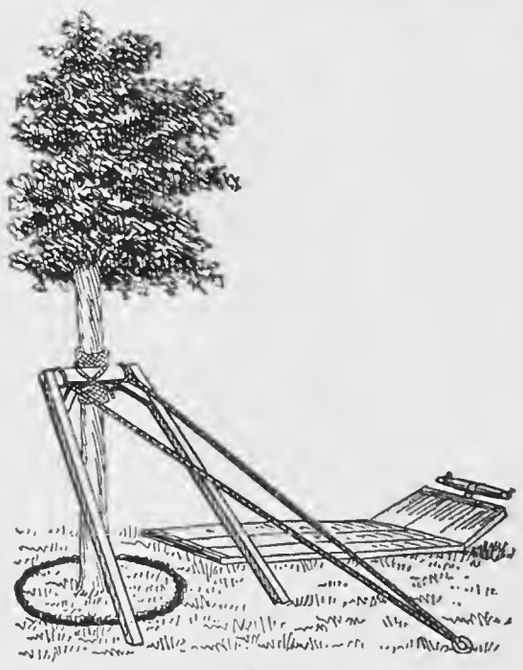


MOVING SHADE TREES.

Can large shade trees be moved, say six inches in diameter, such as elm, maple and basswood, and what is the best time to do such work? L. C. G.

Transplanting Large Trees.

There are many reasons for transplanting large trees, for new ornamenting or other purposes. Persons sometimes desire to remove from the forest or elsewhere to their own grounds, trees 20 feet or more in height. This is always a difficult task, particularly if the trees are taken from the forest, as there is nearly always a net-work of roots, large and small, of other trees to contend with, to make difficult the proper digging of the tree it is desired to transplant. All trees of four inches or more diameter, from whatever source procured, should be removed with a considerable ball of earth attached. Forest trees seldom have sufficient fibrous roots to hold the ball of earth intact, therefore to make the transplanting of them successful they should undergo a season's preparation before removal. This consists in digging around them, in Fall or Spring, a narrow trench three feet or so away from the tree, cutting off all horizontal roots, and with a sharp knife carefully pruning all bruised and mutilated roots, after which fill in the trench with soil and allow the tree to remain without further distrubance



Rig For Moving Tree.

until the Fall or Spring, when they can be safely removed to their new quarters. The root pruning will force thousands of fibers to push out all through the surrounding soil during the season preceding, which will not only supply the tree with a splendid system of feeding roots, but hold the ball of earth so firmly intact that it can be removed any distance almost, without shaking off.

Perhaps the simplest and easiest method of removal, in the absence of an apparatus especially designed for the purpose, is the scaffold and stone boat outfit, shown. Any farmer can construct this and use it. For trees 20 feet in height the scaffold should be at least 10 feet high, about seven feet wide, between the side pieces at the bottom, and may be narrowed to four feet at the top. It should be constructed of hard wood material, sufficiently heavy to carry half a ton or more. When the tree is loosened ready for removal, place the cross piece against the tree, with the standards or side pieces at sufficient angle that when the scaffold is brought to a perpendicular position the tree will be raised high enough to clear the stone boat or drag upon which it is loaded. A good padding of burlap or like material must be wound around the body of the treet at point of contact with scaffold, and securely tied in place, to prevent injury to the bark. The tree is lashed to the scaffold with strong rope of sufficient thickness to carry the weight. A strong horse, or team, as may be required, hitched to the ropes attached to the top of scaffold will easily raise the tree with the adhering ball of earth and deposit it on the drag. It may be unloaded by the same process. K.

Top Dressing Apple Trees.

What would be the best dressing to put around mature apple trees in sod land, and when? Have always used stable manure, but thought something in the chemical line would be better for a change. The soil is heavy and black, with a clay hardpan subsoil. J. E. W.

In this case we would keep on using the dressing of stable manure, put on the sod about as far out as the branches extend. Stable manure being rich in nitrogen should have something to balance it, the potash and phosphoric acid, and this can be done by using around each tree, scattered out freely, five or six pounds of a mixture of three pounds acid phosphate to one part of muriate of potash.

Trees for Fence Posts.

Could you inform me about planting locust trees for fence posts, etc? I would plant them along fence rows where land is used mostly for pasture, as it would make better pasture where other trees make less. Which is the better to plant, Honey or Black locust? S. J. M.

Grantsville, Md.

In your section of the State the Black locust grows well and is not attacked by the locust borer and the leaf miner as it it in other sections. The best plan would be to plant locust trees along the proposed fence row at a distance of 10 feet apart, and then as soon as they are large enough to carry the fence wires they could be used for live fence posts. When they have reached their maximum growth the trees could then be cut down and worked up into a large quantity of fence posts. R. B.

COST OF HEATING FIXTURES.

The recent articles giving experience of persons who tried different methods of house heating have interested me. Over 20 years ago my father built a home and installed the best hot-air furnace then obtainable; this was discarded shortly after and an up-to-date hot-water outfit put in its place. With that we were able to place the heat anywhere we desired, regardless of the direction of wind. That outfit cost about $750, and in later years the boiler being of the earlier type, was replaced by an up-to-date one (after the other had burned out). The plumbers at that time wanted about $250 for the new boiler. I had the "pull" of an architect friend and he found one for us at $175, and we thought we were lucky (this was all in a big city). A year ago I decided a hot-water system would be best for this farmhouse, so began to look them up. I found a house which seemed to carry good stuff, so from pointers I had gained I figured out just how much radiation I would want and the proper boiler. Then giving them a sketch of the house plans (but saying nothing of my estimate on radiation) I asked them for an estimate. Their plans called for practically the same as mine (within 10 feet of it). That convinced me that they knew what they were doing, and I ordered the outfit complete to cost me, as I remember it $273. The boiler itself was only $67, and almost as large as the one I had bought on the "pull" at $175. About that time a brother in town placed an outfit in his house, doing most of it himself and on account of his big "pull" he got off for about $450. Word reached me that he was very sorry I, a farmer, should have ordered such a thing in the way I did, fearing that I would be terribly "stung." I learned the name of his boiler, which was made by one of the best concerns in the country, and when my complete shipment was received, direct from the factory, what did I find in the box but a package of graphite manufactured at that town, where the boiler was made with the name of the big company which had built the outfit, which my brother had used showing to me that the same company had made my outfit complete and that I, a farmer, had won out with twice as much for my dollars as the city brother.

Pleasant Valley, N. Y. R. J. W.

Buliding an Apple House.

I would like to build a house to store apples in. We have good market here and it is inconvenient for us to ship to cold storage and then have the fruit returned again. I have in mind about what I want, but would like to hear from some one who may have something of this kind as to what success they have met with, stating construction, etc. I intend to build one of about 1,500 bushels capacity, cement floor, and side walls about three feet high of cement. On top of this I am thinking of building with 2x4, sheeting outside with inch boards and paper under weather boards. On inside of studding I expect to sheathe with one-half-inch boards and paper, then another one-half-inch board. In this I expect to place sufficient windows so as to be able to sort appres, etc., and also to supply cold air in the early Fall at night. Then I expect to place steam pipes in building to furnish heat in Winter to keep fruit from freezing.

Ringtown, Pa. C. L.

Wood's Celebrated

Grass and Clover Seed Mixtures

Are specially prepared for different soils and purposes. They give the largest yields of

Hay and Pasturage.

Wood's 1914 Descriptive Catalog gives the profitable and satisfactory experience of farmers who for years have been sowing **Wood's Special Grass Mixtures,** with the best permanent results. Wood's Catalog also gives the fullest information about all other.

Farm and Garden Seeds.

THE HIGHEST GRADE OBTAINABLE

Joint Meeting at York, Pa.

January 20, 21 and 22, the Pennsylvania Horticultural Association, the State Live Stock Breeders and the Dairy Union held joint meetings at York. The sessions of the different associations were unusually well attended and the programmes of all were excellent. There were fine exhibits of fruits, corn, dairy products, dairy and creamery supplies and orchard apparatus. Chester J. Tyson of Flora Dale, for a number of years secretary of the Horticultural Association, was elected president; Dr. J. H. Mayer, Willow Street, first vice-president, and J. A. Runk, Huntingdon, secretary. Drastic amendments to the constitution were made advancing annual dues to $2 and life membership to $20, both double the fees imposed heretofore, and closing all sessions of the association to all persons except speakers, delegates from other State societies, minor children and wives of members.

The Dairy Union reelected its former officers: E. M. Bailey, Pittsburgh, president; Prof. C. W. Larson, State College, secretary, and W. E. Perham, Verden, treasurer.

The Breeders advanced E. S. Bayard, Pittsburgh, to the presidency and retained J. F. Lantz, Harrisburg, as treasurer. A very interesting and popular feature of the Breeders' meeting was the meeting with them of the American Berkshire Congress, which brought to the association some of the most famous Berkshire breeders of America, notably among them being N. H. Gentry of Missouri; Prof. C. F. Curtiss, Iowa; W. S. Corsa and Lyman Lovejoy of Illinois, and Alexander Fulford, Maryland. The congress held its annual auction sale Thursday afternoon and it was pronounced the most successful it had ever held. There were 50 Berkshires in the sale, consigned by leading breeders from territory covered between Iowa and Massachusetts, and as far south as South Carolina. The top price of $650 was reached by a sow consigned by Prof. Curtiss, and was paid by Delchester Farm, Pennsylvania. The next highest price, $550, was paid by same purchaser for a contribution by Iowana Farms, Iowa, and $500 for another from Elmendorf Farm, Kentucky. Mr. Buckley of Broadax, Pa., paid $410, the next highest price, for another sow from Iowana Farms. One other sow was sold for $400; one for $350; four for $300 each; two for $275 each, and three for $200 each. As all this fine stock remains in the East, it is indicative of the substantial interest our farmers are taking in the best swine. Pennsylvania has the honor of having received more Berkshires last year than any other State.

Steps were taken to combine the three distinct organizations, meeting jointly at this time, into one united body for the purpose of more concentrated effort in the future. W. F. M'SPARRAN.

BUFFALO MARKETS.

Potatoes are still quoted at 75 cents a bushel to the retailer, and country dealers are paying farmers 65 cents for them, but the consumer has to pay $1 for good ones, on the plea that the retailer cannot make a living at anything less. The quality is fine for the most part. Vegetables generally are not advancing, as they are showing the effect of an open Fall and Winter. Not much but celery is showing the effects of too much warm weather.

On a trip to the Chippewa retail market last week I bought from one dealer a half peck of beets, 15 cents; a quart of string beans, 20 cents; a half peck of sweet potatoes, 15 cents; a head of cauliflower, 10 cents; a bunch of celery, five cents; a bunch of salsify, five cents; a big pineapple, 20 cents, and a dozen of lemons, 15 cents, all amounting to $1.05. This is not, possibly, the best selection for a showing, but I was able to reflect that the same amount laid out for meat would have procured only about four pounds of ordinary cuts, with no approach to porterhouse or veal. Much of this produce pays only one profit, as it is raised in the neighborhood and is kept in trench or cool cellar, to be brought into market by team. Sometimes the farmer or trucker owns his own market stall, but not usually.

Florida strawberries have appeared, retailing at 35 cents a quart. They are better ripened than usual and have not suffered badly in transit. They are much more plentiful in open market than they generally are in early February. All fruits from the South are plenty, Malaga grapes retail at 20 cents a pound, good lemons and oranges at 15 cents a dozen and big grape fruit at five cents each, with very large sizes 10 cents. The sale of bananas is heavy at 10 to 12 cents a dozen. Sweet potatoes are still plentiful.

The big decline in butter on account of the arrival of so much free product from abroad was nine cents, the best brands now offering at 29 cents to the retailer. Eggs remain about stationary, at 36 cents for fresh and 33 cents for storage to retailers. The consumer is seldom sure what he is getting till it comes to the table. Spinach, 20 cents peck; lettuce, five to 10 cents a head; cabbage, three cents per pound; Brussels sprouts, 20 cents a quart; rutabaga, 1½ cents a pound; white turnips, 10 cents per two quart measure; carrots, parsnips, eight cents a two-quart measure. J. W. C.

Milch cows, $60; cheese, 17½; butter, 37; potatoes, 60; eggs, 30; hay, $12 per ton; maple syrup, from 85 cents to $1 per gallon; maple sugar, eight to 12½ cents per pound. W. N. S.

Centerville, N. Y.

Good cattle are hard to get, bringing from $75 up. Dealers pay five cents a quart for milk, retails at 10; cream, 60 cents a quart at retail. Not much butter made to sell in this section. Timothy or mixed hay, $23; Alfalfa, 25; corn fodder, four cents a bundle; corn on ear, 95 to $1 at auctions; potatoes, $2.75 to $3 per barrel; sugar beets, 60 cents a barrel; carrots, $1.25 a barrel; turnips, $1. Apples did not keep well, and were mostly sold early in the Winter, bringing $2.50 to $3 a barrel. Hucksters pay 16 cents a pound for chickens. Eggs scarce and retail at 45 cents a dozen.

Everett, N. Y. J. E. M.

February 5. Fine Winter weather; January was exceptionally warm and good for farm work. No time for harvesting ice yet; plenty of water and feed for stock. Farmers plowing sod and building fence. Brick roads fever has reached this section; of course we all want good roads. A few cattle being fed for Spring market; most of the cream produced in this county is shipped. Hogs, 7 to 8; hay, $11; potatoes, $1; wheat looking well, selling at 90; corn, 80; butter, 22; eggs, 28; chickens, 12; apples scarce, 4½ cents per pound.

Chesterhill, O. W. B. H.

Good grade cows are selling for about $75; no limit to the price for purebred Holsteins. Milk shipped to Rochester, $2.30 cwt., dairyman to pay freight, which is 15 cents per 86-pound can. Butter not over 36 cents at wholesale; veals, nine to 10 cents live weight; potatoes, 70; hay, $12 to $16 per ton. B.

Cayuga, County, N. Y.

Wheat, 92; corn, 70; oats, 45; hay, $12 to $16; straw, $8 to $10; butter, 28 to 35; eggs, 28 to 30; lard, 12; potatoes, $1; hens, 12 cents per pound; apples, $1 to $1.50; dressed hogs, 10; live beef cattle, seven to 8½; cows, $40 to $100; calves, eight to 9½. No milk sold here. Peaches in season were 40 cents to $1.50 per basket. A. A.

East Berlin, Pa.

Fat cows, $6.25 per cwt., live weight; steers, $8 to $8.25; bulls, $6.50 to $7; hogs, $11.25 dressed. Our stock creamery paid for the first half of January 48 cents per pound for butter fat, but the butter came down in price, so that next pay will be only about 40. Farmers have to work for nothing in a dairy; we cannot produce butter for less than 50 cents per pound if we want to pay for our work. The poor people say they cannot afford to pay that price. I know a small dealer in a country village who sells 600 pounds of oleomargarine "Clover Leaf Butter;" he makes six cents per pound, or $36 in a week. Potatoes bring 85 to 90; apples all sold at 90 to $1.

No. 1 Timothy hay pressed f. o. b., $14 to $15; cows from $50 to $60; veal calves, live, nine to 10 cents per pound; pork, dressed, 10½ to 11; butter, creamery, best, 27 to 28; corn, $1.40 per 100 pounds; gluten, $1.50 per 100 pounds; oats, 58 to 60 per bushel; buckwheat, $1.75 per 100 pounds; eggs 28; potatoes, 60 to 70. F. M. G.

East Rush, Pa.

Mitchell Big Six
$2,350.00

An uneven road plays hob with an automobile that isn't properly constructed and *which lacks engineering balance.* It strains the frame, the axles, the springs and the motor of a cheaply built car and no amount of repairs can *ever* make it good.

The Mitchell car is built to *give* where the give is necessary—to resist the strain and sudden jolt—to surmount these and other difficulties *without the disastrous wear and tear* which makes other cars burdens after a year's use—*or less.*

Farmers need better cars than people who live on smooth boulevards and there are hundreds of modern farmers who will tell you that the Mitchell has lasted them—in constant use—*five, six, seven and eight years* and are still the splendid utilities today that they were when bought.

The Mitchell car is more car and better car for the money than any other car in existence and we commend it to the farmer who wants an *economical utility* rather than an *expensive luxury.*

The Mitchell Models for 1914:

The Mitchell Little Six—fifty horse-power—132-inch wheel base—36x4½ inch tires—two or five-passenger capacity - - -	$1,895
The Mitchell Big Six—sixty horse-power—144-inch wheel base—37x5 inch tires—seven-passenger capacity - - - - -	$2,350
The Mitchell Four—forty horse-power—four cylinders—120 inch wheel base—36x4½ inch tires—two or five-passenger capacity	$1,595

Equipment of all the Mitchell Models Included in the List Prices Here Given

Electric self-starter and generator—electric lights—electric horn—electric magnetic exploring lamp—speedometer—mohair top and dust cover—Jiffy quick-action side curtains—quick-action rain vision wind-shield—demountable rims with one extra—Tungsten valves—double extra tire carrier—Bair bow holders—license plate bracket—pump, jack and complete set of tools. Prices F. O. B. Racine.

Planet Jr.

No. 16 Planet Jr Single Wheel Hoe, Cultivator, Rake and Plow

The highest type of Single Wheel Hoe made. It is light, handy, and adapted to use by man, woman, or child. Has leaf guard for close work, and a durable *steel* frame.

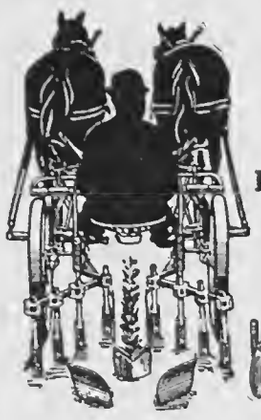
Nearly two million soil-tillers all over the world are saving time, lightening labor and getting better results by using Planet Jr guaranteed farm and garden tools. For all requirements, $2 to $100.

FREE Our new 72-page illustrated catalogue describes 60 tools for *all* kinds of horse and hand cultivation. Write for it today.

S L ALLEN & CO
Box 1107V Philadelphia

No. 4 Planet Jr Combined Hill and Drill Seeder, Wheel Hoe, Cultivator and Plow

This is a practical every day time-, labor-, and money-saver. It combines in a single implement a capital seeder, an admirable single wheel hoe, furrower, wheel-cultivator, and a rapid and efficient wheel garden plow. Every owner of a vegetable garden can save the cost of this tool in a single season.

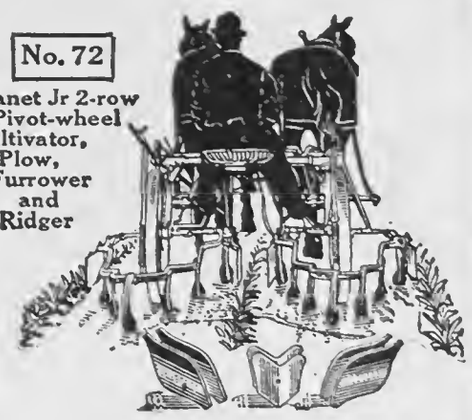


No. 76 Planet Jr Pivot-wheel Riding Cultivator, Plow, Furrower, and Ridger

A wonderful implement in extensive cultivation of corn, potatoes, etc. Light in draft, simple and strong in construction and comfortable to ride upon. Works rows 28 to 44 inches, and cultivates crops until 5 feet high.

No. 11 Planet Jr Double Wheel Hoe, Cultivator, Plow and Rake

The greatest cultivating tool in the world for the grower of garden crops from drilled seeds. It has steel frame. The plow opens furrows for manure, seed, etc., and can be reversed for covering. The cultivating teeth are adapted for deep or shallow work and for marking out. Crops can be worked both sides at once until 20 inches high.



No. 72 Planet Jr 2-row Pivot-wheel Cultivator, Plow, Furrower and Ridger

Cultivates at one time two rows of potatoes, corn, beans, etc. in rows 28 to 44 inches apart. Works like a charm in check rows, crooked rows, and rows of irregular width. Can be equipped with roller-bearings, spring-trip standards, and discs.

Hidden Values in Seeds

Some automobile makers boast the hidden values of their cars—values invisible and impossible of laboratory analysis. "Under the Hood" is their summary. In the case of SEEDS, hidden values far greater lie dormant beneath the seed coats, qualities definite and potential, still not to be estimated in the laboratory or without; values to be seen in the maturing crop only, after a season's time and labor is spent—then what differences are manifest? The difference between pleasure and disappointment, and for the professional, success and failure.

The hidden qualities in **Vaughan's Special Strains of Seeds** are made plain in our **1914 CATALOG** mailed with sample Pansy packet **FREE** upon request. Send your name and address and that of your neighbor.

Send 10cts for our Hidden Value Collection of High Bred Seeds of earliest vegetables.

Feeding a Sod Mulch Orchard.

I read with interest Prof. Hedrick's remarks on page 137 on the Hitchings' method of orchard culture, but I fail to find any mention of the use of fertilizer of any kind. Can you advise me whether Mr. Hitchings uses no fertilizer, and feeds his trees hay only? C. F. H.
Massachusetts.

Thus far Mr. Hitchings has used no fertilizer for his general crop. We think a small quantity has been used as an experiment, but generally speaking the grass which grows in the orchard and decays there provides the plant food, except, of course, such as the natural soil provides. This orchard is located on very strong soil naturally, and it is doubtful if chemicals would pay. Possibly phosphoric acid might help, but Mr. Hitchings has secured good results from his present method, and has reason to be satisfied with it. Read the article by Prof. Coville on limestone and mulch. We think this is sound, and that the best results from mulching will likely be found where the soil is well supplied with lime.

Cover Crop and Sheep Manure.

1. I have recently bought a farm, poor and run down, and I notice that you recommend Cow-horn turnips for building up land. Do you think that I could take Cow-horn turnips and plow them under year after year and improve this land? Land is stiff and absolutely devoid of humus. Of course I would intend to subsoil the land and gradually get deeper—about an inch at a time. German (Crimson) clover makes a "hit" here every year, but my idea was to cut out such late plowing in the Spring as that is very often our driest season. 2. Can you advise me as to the reliability of pulverized sheep manure? Is it any better than some other brands that sell for the same price, $24 per ton, here? It is claimed that one bag is equal to a whole load of stable manure. H. E. M.
Prince George, Va.

1. No, you will not bring your farm up to high fertility by sowing Cow-horn turnips alone. These turnips grow on poor land and make a fair supply of organic matter, besides digging deep into the soil. They do not add as much organic matter as some other crops, and do not add any nitrogen as clover and vetch do. We doubt the great value of subsoiling such land. Far better sow rye, buckwheat, clover and vetch, plow under deep and use lime. We find a combination of rye, turnips and clover or vetch very effective. If you want crops that will not winter over, sow turnips and buckwheat. 2. The pulverized sheep manure will not pay to use on a farm. It is designed for garden or greenhouse work, or tobacco or intensive farming. Cover crops, lime and chemicals will pay you better.

Fertilizing Rye for Green Manuring.

I have a field of rye on rather poor land which I wish to plow under and plant to corn. Would it be advisable to give the rye an application of fertilizer this Spring? I would like to use about 500 pounds of acid phosphate per acre. Would this give a larger growth of rye, or would it be better to broadcast the fertilizer after rye is plowed under? Would the acid phosphate and rye have a tendency to sour the soil? G. R. C.
Cincinnati, O.

We doubt whether the acid phosphate will increase the growth of the rye to any extent. Nitrate of soda would do so, but we doubt whether there would be enough extra growth to pay. It is something of a question as to whether it pays to fertilize the cover crop. Where this crop contains clover, or vetch or beans we think it pays to use phosphate and potash where such crops are seeded. During the growing season these mineral fertilizers encourage a larger growth, and that means more nitrogen from the clover, beans or vetch. For rye it might pay to use the fertilizer at seeding, but hardly so in the Spring if the rye is to be put under for corn. We would rather put the fertilizer on the corn. If you pack the rye down hard with a roller or heavy drag after plowing it will not be likely to sour the ground.

"THEY told me to use a live frog for bait," said the stranger, "but I've been here all day and haven't had a bite yet." "I reckon not, suh," said the old Georgia darky. "De frog hez swimmed ter a log wid yo' hook an' line, an' is settin' cross-leg on de log a-lookin' at you!"—Atlanta Constitution.

Start Your Garden Early

In response to a special demand I have manufactured a sash frame 8 ft. 4 in. long and just wide enough for a 3 foot space with southern exposure. In place of many small lights there is one large light of extra-heavy glass which allows the maximum of life-giving sunlight to reach seeds and plants. It is so simple a child can ventilate it. If desired the sash can be hinged. Price complete, ready to put together, freight prepaid anywhere in the United States $10.50 (a remarkable low price, made possible only by the large volume of my business).

If you would enjoy home-grown produce in June, start your garden in February. Send your order and check today. Shipments made promptly.

Planting instructions sent with each frame. Write for Catalogue of LUTTON'S GREENHOUSES and glass garden equipment.

A NEW JERSEY TURNIP CROP.

On page 35 an Ohio farmer tells the readers of a catch crop of turnips which proved profitable to him. This prompts me to write of the method followed on this farm, where Swede turnips are a regular yearly crop with which we have been fairly successful, and for which there is a steady local demand. It was formerly believed here that no turnip quite equalled in quality those which were grown in the cooler climate of Canada, but for years this belief has been proved to be unfounded, until now the Canada product does not find a market so long as the home-grown can be had. Each Spring we take a piece of sod or a corn stubble if it is free from weed seed. Early in May we plow under 10 or 12 two-horse loads of stable manure to the acre, about eight inches deep. Then the work of the disk harrow begins, no other harrow is quite as good as a pulverizer and weed killer. Every two or three weeks until about the first of July, this ground is disked, until we have started and killed all grass and weeds and have a nice mellow seed bed for the turnips.

I will say here that the Spring droughts of each of the last four years made our soil so dry that weed seed lay in the soil without sufficient moisture to sprout them before the turnips were planted. After the rains came these dormant weed seeds sprang up and made expensive cultivation necessary. Before the last disking we broadcast from 400 to 500 bushels per acre of a good commercial fertilizer analyzing three per cent. ammonia, eight phosphoric acid and six potash, with 10 bushels of unleached wood ashes well disked into the soil. This soil is a naturally drained sandy loam running from one-third to one-half sand. We have found this fertilization on this soil produces a rapid growth from start to finish, which is essential if a good turnip is grown. We formerly made the drills 30 inches apart, but our customers complained that the turnips grew too large to be conveniently measured when retailed. We then drilled 15 inches apart and thinned the plants to six or eight inches in the rows. This reduced the roots to a more desirable size.

These narrow rows prevented the use of horse cultivation that we used on the 30-inch rows, and called the wheel hoe into use. We are careful to adjust the drill so that not too many seeds are sown, as too many plants make expensive thinning necessary. Our drill does not give us much of this work to do. We find that if the seed is good three-fourths of a pound is about the right quantity per acre. This seed question is a very important one to the turnip grower. A few select their best-shaped roots and grow their own seed, to be sure their stock is right. I have suspected some seed was grown from culls, and I am convinced that some seedsmen mix old and new seed. In my early experience I one year lost more than $100 by buying one pound of seed which proved untrue to name. On another occasion I introduced a disease, which it took some years to get rid of, by planting a trial one-quarter pound sent me by a well-known seedsman.

We find the Improved Purple Top Swede variety about fits our market and is almost invariably a symmetrical globe shape, and always tender and of the best flavor. If the soil is moist we run our drill about one inch deep, but if a drought is on two inches is better. With fresh seeds and a moist soil in a week after planting the rows will show and the earlier the wheel hoes put an end to stray weed or sprouting grass root the better for the crop. In droughty years we find it well to give two cultivations.

Some growers are troubled with the black flea beetle, thrips and the cabbage worms, but of late years we have had no trouble with these. If they did appear we would broadcast air-slaked lime when the dew was on the leaves. The turnips are pulled from the first to the twentieth of November. We choose a time when the soil is quite dry. We remove the tops and fibrous roots with a moderately heavy knife. We put in piles of eight or 10 bushels in the field until dry, and cover with the tops until we are ready to draw them from the field to protect them from the sun and frost. We bury them in permanently kept pits holding about 40 bushels each, and cover with forest leaves a foot thick, with a thin layer of dirt on top to prevent the leaves from blowing away. They keep more crisp in these pits than in a cellar, and are easy to get at any time during the Winter, but as a rule a large part of the crop is marketed directly from the field without pitting. One wholesale firm usually buys nearly the entire crop, doing their own cartage, and the price ranges from 30 to 35 cents per bushel. The yield is from 200 to 400 bushels per acre.

J. ANDREW CASTERLINE.

Lime and Phosphate or Mixed Fertilizer.

I am planning a five-year rotation, corn, oats, three years grass, using most of my manure on grass seeding. Which will give me the better results on my silo corn, 450 pounds commercial fertilizer per acre 4-8-7, or one ton lime, 300 pounds South Carolina rock, 14 per cent., and about five tons manure taken from cow dump and spread broadcast on Fall plowing? I am of the opinion that $100 invested in burned lime at $4.25 per ton and rock analyzing about 14 per cent. phosphoric acid will give me better results ultimately than to put same amount into commercial fertilizer. M. H. P.

Milford, N. Y.

Such a case needs both experience and discussion. Opinion is not worth much without studying the soil and the crops. For a few years on such a soil the lime and phosphate with a small amount of manure will be likely to give satisfactory crops. This will be specially true if some cover crop like rye and vetch is seeded in the corn to be plowed under later. That would most likely keep up the humus supply and provide some nitrogen. If on heavy land little potash would be needed, but on light soil the time would probably come when some potash must be used. You should not trust to opinion alone—though the plan seems reasonable—but you should test the matter. Use the mixed fertilizer on half an acre or more of this corn and watch results. We would like the experience of other farmers on this point. Will lime and phosphate and a small dressing of manure take the place of a mixed fertilizer? On our own farm, where the soil is naturally hard and sour, cover crops and the annual use of lime surely take the place of part of the chemicals. Fifteen tons of silage corn will take off 80 pounds of nitrogen, 30 of phosphoric acid and 105 of potash.

Mustard Seed in Manure.

We have a field of a few acres which has become infested with mustard. We seeded it to buckwheat, which was badly mixed with mustard. Some of this buckwheat was given to the hens to scratch over, and being forgotten later, was mixed with other manure when henhouse was cleaned. How can we use this manure, to avoid spreading the mustard further?

Sullivan County, N. Y. J. N.

Wild mustard is one of the most troublesome of weeds in fields not frequently given over to cultivated crops. The seeds will retain their viability for a long time, having been known to germinate after having lain dormant in the ground for 15 years. It is an annual, maturing its seed each year, and can, of course, be eradicated from a field devoted to some hoed crop, and kept clean. Grain fields have been cleared of it by spraying them while the mustard was in blossom with a solution of iron sulphate, 75 to 100 pounds to 52 gallons of water. This kills the mustard without injuring the grain. Probably your best plan now will be to use this manure upon corn, or some other hoed crop, and take pains to destroy all mustard plants that come up before they have gone to seed. Perhaps you can put that manure upon the same field from which the mustard seed came, and thus corner your enemy where you can concentrate your energies upon him. A short rotation of crops will enable you to subdue the mustard by giving frequent opportunities to destroy it with cultivator and hoe.

"DEATH, TAXES AND The Mapes Manures Are the Only Three Things in This World I Am Sure of"

WROTE AN OLD CUSTOMER OF OURS

Passing by the first two, he and every other farmer certainly has every right to be sure of THE MAPES MANURES. They have been used for fifty years by the most intelligent, the solidest and most successful farmers, who have banked absolutely on

I. THE RECORD OF MAPES IN THE FIELD.

Our record in the field for the past fifty years is too well-known to require more than a mere reference. In this connection, "lest we forget," in the American Agriculturist's Prize Contest, open to the entire United States, the largest crops of Potatoes and Corn grown on commercial fertilizer alone were grown with Mapes; 669 bushels of Potatoes on one measured acre with the Mapes Potato Manure, and 213 bushels Shelled Corn on one measured acre with the Mapes Corn Manure.

II. THE MAPES RECORD WITH THE EXPERIMENT STATIONS.

We are equally proud of our record with the Stations. There may at times have been an occasional chance analysis which was not quite what we would have liked, and not fairly representative of our goods, but on the grand average, year in and year out, our record has been something to be justly proud of.

III. SAME FAMILY MANAGEMENT FOR THREE GENERATIONS.

Not only have the Mapeses continued successively in the business for three generations—grandfather, father and son—but the Lanes, who have been associated with the Mapeses from the start, follow the same identical record in the business, grandfather, father and son, successively. Could there be a better guarantee than this family management, with the element of family pride deeply involved, that everything has been done and will continue to be done to make the Mapes Manures as good as the knowledge of fertilizer science permits for the crops for which they are intended.

The Mapes Manures have never stood still but have been constantly improving as the knowledge of scientific plant feeding broadened and progressed.

"The Mapes business had its inception in the scientific research and experiments of Professor James Jay Mapes, and scientific research and experiment, coupled with the most exact practical experience, have been the dominating factors in the Mapes business to the present day."—The Florida Grower.

EVENTS OF THE WEEK.

DOMESTIC. — Ex-Representative Lucius N. Littauer and his brother, William Littauer, who pleaded guilty the day before to smuggling a tiara worth $9,000 into this country, apparently faced imprisonment for six months, Feb. 4, when Judge E. S. Thomas, in the United States District Court, thus sentenced each and also imposed a fine of $1,000. The sentence was mitigated the next instant, however, when Judge Thomas explained that because so many others had escaped with fines only he would suspend the prison sentence and place the prisoners on parole for five years. While the two smugglers, one of whom made the bulk of his fortune as the result of the enforcement of the customs laws on leather, will not go to prison unless their behavior within the five years sends them there, in the eyes of the law they are convicts and lose their citizenship.

The State Senate Codes Committee gave a hearing at Albany, Feb. 4, on the bill of Senator George A. Blauvelt of Rockland county, which is designed to prevent the sale of bichloride of mercury tablets except on a physician's prescription. Dr. Henry Gallant of New York predicted that the manufacture of the tablets will soon be prohibited by law. McDonald De Witt of New York, who led the fight for the bill, said that there had been 78 deaths in the past eight months from bichloride of mercury poisoning and that only 35 of these were suicides. The remainder, he said, took the poison by mistake, 22 of them thinking they were taking headache tablets. A dangerous feature of the drug is that any person can go to a drug store and get enough for 10 cents to kill a whole family, he declared. Wholesale druggists opposed the bill because they claimed that under it the distribution of bichloride by them is prohibited. It is believed this objection will be met by an amendment.

Lorenzo B. Adams, "an investment broker," of 1 Broadway, New York, said to be a nephew of the late Al Adams, the policy king, although he denies the relationship, was arrested Feb. 6 by the postal authorities, charged with using the mails to defraud. Lorenzo Adams became an investment broker five years ago, but the attention of the authorities did not become focussed on him until about three months ago, when complaints caused an investigation. For three months Post Office Inspectors Mayhew and Swain kept tabs on his business; then they drew up the complaint and arrested him. They assert that Adams used a cheap scheme to defraud, cheap but highly lucrative. It is charged that he represented to firms wishing to sell stocks or bonds that he had a large wealthy clientele and it would pay them to have him push the stock. He said he had a mailing list of 20,000 and numerous agents through the country. If a firm wanted him to push its stock he would say the first step was to circularize his mailing list. This would cost anywhere from $87.50 up, the maximum sum that has come to the attention of the authorities being $1,000. He would make the firm pay the cost of printing and mailing these circulars, according to his alleged system, and instead of sending out the circulars would keep the money. In the last three months, while his business has been under the eye of the authorities, he has obtained $6,000 in this manner, the postal inspectors say.

The British Court of Appeal, Feb. 4, sustained the decision of the King's Bench Court, which in a test case brought last June by an Irish farmer, claiming damages for the loss of his son in the Titanic disaster, declared illegal the clause printed on the steamship tickets exempting the company from liability for loss by a passenger even through negligence of the company's servants. The judgment of the Court of Appeals, in dismissing the appeal of the White Star Steamship Company from that decision, was delivered by Lord Justice Sir Roland Vaughan Williams, who declared that practice did not justify a vessel in maintaining her course and speed when the warnings of danger ahead were such as the Titanic received.

FARM AND GARDEN.—The sixth annual farmers' week will be held in Burlington at the College of Agriculture of the University of Vermont, Monday, Feb. 23 to Friday, Feb. 27, inclusive. Thirty-five different speakers, 55 addresses, more than a score of demonstrations are scheduled. The attendance in recent years has exceeded 400. A women's institute will be held coincidently, under the auspices of the Department of Home Economics of the University. The Greater Vermont Association also meets in Burlington on Feb. 24. All meetings are free to all comers. Programs can be secured on application addressed to Dean J. L. Hills, University of Vermont, Burlington, Vermont.

The annual meeting of the Jewish Agricultural and Industrial Aid Society, was held in New York, Feb. 7. Of the farm credit system, President Jaretzki says: "Our credit unions, of which we have seventeen, are exercising a potent influence upon Jewish farming in this country. They have been in operation for periods averaging a little over 13 months. They now have a total membership of 517 and a paid-up capital of $9,165. The loans made by them aggregate $73,624.66, and their net profits amount to $1,317.93. They are doing excellent work, and, as the pioneer coöperative agricultural credit banks in this country, have attracted general and favorable attention. During the year 1913 the aid society made 423 loans, aggregating $244,997.85, surpassing all previous records. The repayments from farmers amounted to $119,225. During the 14 years of its existence the society has lent a total of $1,739,415. The loans were made in 32 States and in Canada, to 2,600 farmers. There are now outstanding loans aggregating $902,649. Thirty-five scholarships to children of Jewish farmers were awarded during 1913, as against 20 in the preceding year. The credit unions established by the society are the outgrowth of the land credit system. The first one began business in May, 1911. Of the 17 existing, eight are in New York. The society also sends labor to farmers. The directors of the society are Eugene S. Benjamin, Francis D. Pollak, Percy S. Straus, Alfred Jaretzki, Solomon G. Rosenbaum and Cyrus L. Sulzberger.

The Idaho Seed Growers' Association elected the following officers at the annual convention at Pocatello: B. C. McWaters; president; J. Wyley Sessions, vice-president; R. B. Coglan, Pocatello, secretary, and W. L. Shattuck, treasurer.

The seventh annual convention of the Ohio Nurserymen's Association was held Jan. 21, at Cleveland, O. The officers were reelected and are as follows: President, W. N. Scarff, New Carlisle; secretary, W. B. Cole, Painesville; treasurer, A. R. Pickett, Clyde. Executive committee, Robert George, Painesville; A. R. Dinsmore, Troy; T. B. West, Perry; W. F. Bohlander, Tippecanoe City, and J. W. Gaines, Xenia.

The annual meeting of the Oregon-Washington Nurserymen's Association was held in the Hotel Kennewick, at Kennewick, Wash., Jan. 20, and the following officers were elected: President, C. F. Breithaupt, Richland, Wash.; vice-president for Washington, F. W. May, North Yakima, Wash.; vice-president for Oregon, H. A. Lewis, Portland; secretary and treasurer, C. A. Tonneson, Tacoma. Executive committee, A. Brownell, Portland, and J. McGhee, Orenco, Ore. It was decided to hold the next meeting of the association at Vancouver, B. C., in June. It will be held jointly with the Pacific Coast Association of Nurserymen.

The abolishment of the Board of Food and Drug Inspection of the Department of Agriculture, which was made prominent by Dr. Harvey W. Wiley, former head of the Bureau of Chemistry, was announced, Feb. 7. Hereafter all authority which was vested in the board will be in the hands of Dr. Carl Alsberg, successor of Dr. Wiley. Dr. A. S. Mitchell and Dr. H. N. Loomis, who were members of the board of food and drug inspection, have been given other duties in the bureau of chemistry. Dr. Alsberg will be assisted in the administration of the law by Dr. R. L. Emerson of Boston.

GOV. GLYNN'S MESSAGE.—Agricultural organization rather than legislation is needed in New York, Gov. Glynn told the Legislature, Feb. 10, in a special message. In keeping with this declaration he asked the legislators to appropriate not less than $25,000 nor more than $50,00 to be expended in a campaign of organization and education in the rural districts. By means of lectures he would enlighten farmers on the present State agricultural laws, and instruct them in the best methods for organizing coöperative societies for the sale of their products. The lecturers also would take an active part in the organization of coöperative societies. After pointing out that the few coöperative societies in the State had been successful in reducing the price of many farm supplies and raising the price of farm products, the Governor gave some suggestions on how the organizers should go about their work. "The Legislature," he said, "should secure for the State the services of men who will make it their sole duty to go through the State explaining these coöperative laws and assuming the responsibility for creating and organizing credit unions and coöperative marketing societies. These men should make it their business to organize markets and shipping stations under the control of local coöperative marketing associations. One large receiving center in cities and towns of medium size will answer all the purposes of a packing, grading, shipping, and marketing station. Here the produce will be delivered by the neighboring farmer and credited to his account. The goods will then be graded, packed, and labelled. Pains will be taken to supply first of all the demands of the local towns. The balance then can be shipped in carload lots to the centers of best demand. One central station equipped with cold-storage facilities can accommodate the surplus products of several smaller stations."

COMING FARMERS' MEETINGS.

Sixth National Corn Exhibition, State Fair Grounds, Dallas, Texas, February 10-24.

Annual farmers' week, Vermont College of Agriculture, Burlington, Vt., February 23 to 27.

Massachusetts Agricultural College, Amherst, ten-weeks' Winter course, January 6 to March 13.

Thirty-ninth annual meeting of the American Association of Nurserymen, Cleveland, O., June 24-26.

Make Every Inch of Soil Produce the Maximum at Lowest Cost

IN ORDER to make your soil produce its maximum yield, you should supply a fertilizer "made to order" to meet your individual soil and crop conditions.

Consumers Brands for General Farm Use

comprise special distinct compositions of plant food elements for forage crops, root crops and cereals to meet just your individual soil and crop requirements. They supply just the constituents your particular soil may need for some special crop. You pay for no unnecessary plant food elements.

Early Crop Odorless Fertilizers

is prepared especially for the market garden trade for vegetables, small fruits, greenhouse and garden crops. It supplies the four plant food elements needed for these crops in soluble form, mixed in such proportions as to meet your particular soil and crop requirements. Although soluble, it is so prepared in granular form as to prevent leaching and wasting. It produces quick growth and early maturity, which means ***bigger profits.***

Holden's Special Fertilizers

For Florists and Gardeners for Greenhouse Work

These fertilizers are prepared by men who have made a life study of greenhouse fertilization in such a manner as to furnish just the plant food elements which your compost lacks. For this reason you save the cost of such plant food elements as your particular soil or crop may not require.

Mak-Gro Odorless Plant Food

A clean, high grade, granular fertilizer for potted house plants, window boxes, flower beds, small fruits, lawns and general home garden use—made for the amateur. A splendid side line for florists operating their own stores.

Agricultural Chemical and Fertilizer Materials

We are prepared to furnish all high grade agricultural chemicals and fertilizer materials in any quantity. We make a specialty of Genuine Thomas Phosphate Powder (Basic Slag).

WE SELL ONLY DIRECT TO THE CONSUMER

502.6 Bushels Potatoes

From One Acre of Ground

TWENTY DIFFERENT FARMERS in 20 different parts of New England competed the past year in growing potatoes. The crops were widely separated as to climatic and weather conditions. Each one planted, cultivated and took care of his crop in his own way; *but all used*

Bowker's Fertilizers

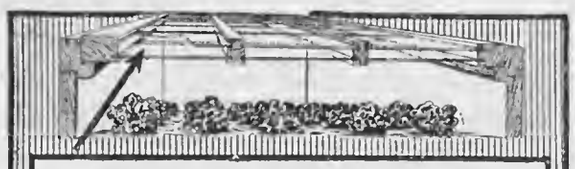
And No Other Dressing

The winning crop was 502.6 bushels. The average of the twenty crops was 322.8 bushels. The average yield in New England is 131.6 bushels, and for the United States 89 bushels. Our crop-growing contests of the past four years have been so fairly and accurately conducted that they have been accepted everywhere as authentic. Henry Wallace, Editor of Wallace's Farmer, writes: "There is no guesswork about them."

Send for our Book of the Contest. Also tell us what your crops are, and your fertilizer requirements and we will send you our helpful book on Plant Food and our new Illustrated Catalogue.

BOWKER FERTILIZER COMPANY
43 Chatham St., Boston.

Also New York, Buffalo, Philadelphia and Baltimore



NOW'S THE TIME TO GAIN ON SPRING

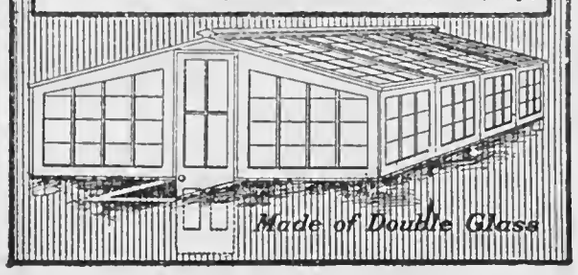
It matters not what the outside weather is, there are always growing conditions under **Sunlight Double Glass Sash.**

You need these sash to begin right. They capture the sun's rays and liven up and warm the hot-bed and cold-frame during the day and the heat then stored is conserved over night by the two layers of glass and the dead air space between them. Mats or shutters are never necessary, saving half the cost and labor.

The Sunlight idea has been carried into a Small, inexpensive Greenhouse. It is made of Sunlight Sash, which are instantly removable for use on hot-beds or cold frames. Serving a double purpose and requiring little artificial heat, this greenhouse is very inexpensive.

Get our free Catalog. If you want Prof. Massey's valuable book on hot-bed and cold-frame gardening, send four cents in stamps.

SUNLIGHT DOUBLE GLASS SASH CO.
924 E. Broadway - - Louisville, Ky.



The BALL SEED AND PLANT FORCER
A NEW METHOD IN MODERN HORTICULTURE.
Patent Applied For.

This is just what you have been looking for. Can start out-door gardening weeks ahead of usual time. Cheap enough to use them by the thousands. A complete individual glass-covered plant frame, like cut, as low as 2½ cents each. Will make your sugar corn, lima beans, melons, cucumbers, lettuce, and all vegetables and flowers two to four weeks earlier than by any other method. A Fertilizer Mixture.

What would my fertilizer mixture grow best? Would it be advisable to use this mixture on corn and if so what amount, and would it be best to sow broadcast or in drill? I can buy these chemicals as follows: 600 pounds nitrate of soda, $16.68; 600 pounds dried blood, $15.48; 1,800 pounds bone, $25.29, and 900 pounds muriate of potash, $20.34. These prices are on time, or 5 per cent off for cash. I could get 1,800 of acid phosphate for $16. Would it make a better mixture to leave out the 1,800 pounds of bone and put in 1,800 pounds of acid phosphate instead? Could you give a better mixture for corn and cabbage?
Bonney, N. Y. F. P. B.

At average analyses you will have the following composition:

	Nitrogen	Phos. Acid	Potash
600 Nitrate	96	...	...
600 Blood	72	...	...
1,800 Bone	54	450	...
900 Muriate	..	...	450
3,900	222	450	450

This means a mixture containing 5.7 per cent. nitrogen, 11.8 phosphoric acid and 11.8 potash. The cost is $77.79 or $39.80 per ton. Such a fertilizer is best for such crops as potatoes, grass or garden crops, or field crops like cabbage. For our own use we would rather use 1,000 pounds of acid phosphate and 900 pounds of bone. This will make an even two tons a little lower in nitrogen and correspondingly lower in phosphoric acid.

Seeding a New York Pasture.

I wish to seed down to permanent pasture some damp land, some dry, and some intermediate. Orchard grass never fails here or has to be reseeded. How would one part Orchard grass, one part Meadow fescue, one part Tall Meadow oat-grass be for permanent pasture and how much each do I want per acre to have it seeded well? Can I cut it a few years for seed to seed other pieces? O. S. B.
Alpine, N. Y.

The mixture of seed one part Orchard grass, one part Meadow fescue, and one part Tall Meadow oat-grass, that you suggested will take several years before the field comes to maturity, and the cost of seed is greater than that of other good pasture seeds. The amount of lime present, the soil conditions themselves, and the amount of moisture vary in different parts of a field; thus a mixture of a greater number of seeds is more apt to give a good permanent stand than a mixture of two or three alone. Under the conditions you mentioned, with the soil and moisture varying in different parts of the field, the following mixture is perhaps the most successful: Timothy, seven pounds per acre; Red clover, four pounds, or Alsike clover, three pounds per acre; Kentucky Blue, seven pounds per acre; White clover, two pounds; Orchard grass, six pounds; Meadow fescue, four pounds; Tall Meadow oat-grass, four pounds per acre. The Timothy and Red and Alsike clovers are introduced so as to make a quick stand, so that a hay crop can be obtained while the meadow is becoming prepared for permanent pasture. In the damper or acid soils a greater proportion of Alsike clover could be used to advantage than shown in the above table. The Kentucky Blue grass makes a compact sod which stands a large amount of tramping and close grazing without injury. In New York State this and White clover form the basis of the seed mixtures in most of the permanent pastures. Fescue and Kentucky Blue will take three years to come into their prime as pasture land. Orchard grass seed should not exceed 15% of the total used, as it grows in tussocks or bunches, and should not all be added the same year. It would not seem advisable to attempt to raise for seed, for several reasons. The hay in the first few years will be worth more than the seed. The companies selling grass seeds obtain it from places where the hay is worth but little, but in New York, where hay sells for over $15 a ton, it would be cheaper to buy the seed outright. Flowers of all varieties will not set in certain localities, which is another factor against raising one's own seed. A small plat of average ground might be used for the perfection of certain varieties, but commercially this is not practical. There are certain counties in the Middle West which can produce better seeds than New York because the climatic conditions are more favorable. W. H. B.

Hope Farm Notes

Some of our people are telling us about the best or most satisfying meal they ever ate. This question of food seems to depend on habit, hunger and personal taste. I saw a man once in a lumber camp eat plate after plate of a stew made of meat, potatoes and carrots—cooked in a big iron kettle over an open fire. At home this man would have growled at turkey or terrapin but here he was passing back his plate again and again, asking the cook to put more carrots in. "Why," he said, "I thought carrots were made for horses to eat. I didn't know human beings ate them!" He never had been a real human before—not until hunger caught him and pulled him right up to that iron pot. At his club in the city he could not have eaten three mouthfuls of that stew.

It is different with sleep. The man with no appetite can get on after a fashion, but he who cannot sleep is a pitiable object. I met one once—a rich man who had worked too hard—starved himself of sleep in order to get hold of rather more than his share of money and power. He had passed the limit of nerves and was denied the power of sleeping. A few snatches of rest were all he could get, but through the long, still nights he lay awake, thinking, thinking with the constant terror that this would end in a disordered mind.

We sat before this man's fire late at night, and he told me about it. To you sleep seems like a very common and simple thing. The night finds you tired, and you shut your eyes and before you know it you are sailing off into a peaceful, unknown country. Here was a man who could not sleep. He must remain chained to the cares and terrors of his daily life, and the bitterness of it was that all the money he had slaved so hard to obtain could not buy him what comes to you and me with the mere closing of the eyes. It seemed to me the most despairing mockery to hear this man repeat Sir Philip Sidney's "Ode To Sleep":

Come sleep; O Sleep! the certain knot of peace,
The baiting-place of wit, the balm of woe,
The poor man's wealth the prisoner's release,
Th' indifferent judge between the high and low;
With shield of proof, shield me from out the prease
Of those fierce darts Despair at me doth throw;
O make in me these civil wars to cease
I will good tribute pay, if thou do so.
Make thou of me smooth pillows, sweetest bed,
A chamber deaf to noise and blind to light
A rosy garland and a weary head.

"That's it," said my friend. "*A weary head. A weary head.* Mine is weary but sleep will not come." He sat looking at the fire for a long time, and then he turned suddenly with a sort of haunted look in his eyes:

"I wish you would tell me about the *best sleep* you ever had. Men may tell of their best meal, but I want to know about *rest*—the best sleep."

It was a strange request, but as I sat there my mind went back to a hillside near the New England coast where the valley slopes away to a salt marsh with a sluggish stream running through it. A low, weather-beaten farmhouse crouches at the foot of the wind-swept hill. It is a lonely place. Few come that way in daylight, and at night there are no household lights to be seen.

It had rained through the night, and the morning brought a thick sticky fog. It was too wet to hoe corn, and Uncle Charles said we could all go gunning. He was an old soldier, a sharpshooter and a famous shot. So we tramped off along the marsh, following the creek until it reached the ocean. What a glorious day that was for a boy! I carried an old army musket that kicked my shoulder black and blue. We tramped along the shore and through the wet marsh, hunting for sand-pipers and other sea fowl. Now and then a flock of birds would seem to be lost in the fog, and Uncle Charles would whistle and call them up to where we lay in ambush. It all comes back—clear and distinct—the cries of the sea fowl and the dull roar of the ocean as it pounded upon the beach. Late in the afternoon we tramped home wet and tired but with a long string of birds. The ocean roared on behind us louder than ever as the wind rose.

It was not good New England thrift to eat those birds—the guests at the Parker House in Boston would pay good money for them. While we had been hunting, Aunt Eleanor and the girls in the lonely farmhouse had been busy with a "New England dinner." There was a big plate of salt codfish, first boiled and then fried crisp with little cubes of browned salt pork mixed with it. There were boiled potatoes which split open in a rich dry flour, boiled onions and carrots and great slices of brown bread and butter. Then the odor from the oven betrayed the crowning act of all—a monstrous pan-dowdy or apple grunt! Ever eat a genuine pan-dowdy in a New England kitchen as a wet dreary night is coming on after a tiresome day? No? I am both sorry and glad for you. You have missed one of the greatest joys of life, but you have much to look forward to. When Uncle Charles began to cut that pan-dowdy we boys realized that we could not do it full justice, so we went out and ran around the house and barn half a dozen times to make more room for the top of the feast.

After supper the dishes were washed, the house cleaned up and we washed out our guns. The old musket had kicked my shoulder so I could hardly raise the arm, but no human being could have made me admit it. We got Uncle Charles to tell us about the time he shot at the officer at Port Hudson during the war, and about the hump-backed man who carried the powder from Plymouth to Boston during the Revolution. Then through the gloom and fog came two young men to call on the girls. In those days it seemed to me very poor taste for one to listen to the conversation of girls rather than war stories. True, the war stories were time-worn, but the girl conversation was older yet. Soon the little melodeon was talking up and a quartette were singing the old songs of half a century ago. It may have been the day's tramping, the old musket or the last plate of pan-dowdy or the tap of the rain on the window, but sitting there by the warm kitchen stove I felt a delicious drowsiness stealing over me.

Bed is the place for sleep, and we boys climbed the stairs, past the great central chimney, and quickly tumbled into bed. In the room below that quartette had started an old favorite:

"Along the aisles of the dim old forest
I strayed in the dewy dawn
And heard far away in their silent branches
The echoes of the morn."

There was one great booming bass voice which had unconsciously fallen into the key of the dull roar which the distant ocean was making. The rain was gently tapping on the roof, and all the joys and pleasant memories of youth were whispering happy things in our ears as we sailed off on the most beautiful voyage to dreamland.

I told this as best I could before the fire while my weary friend listened leaning back in his easy chair with his hand shading his face. And when I stopped sleep had come to him at last—sweet and blessed sleep. There are very few of us who would stand for a photograph taken while we were sleeping, but this man's face was free from care. An orator might not think it a high tribute to his powers that he sent his audience to sleep, but I am not an orator, and I would like to be able to give my friends what they consider the blessed things of life!

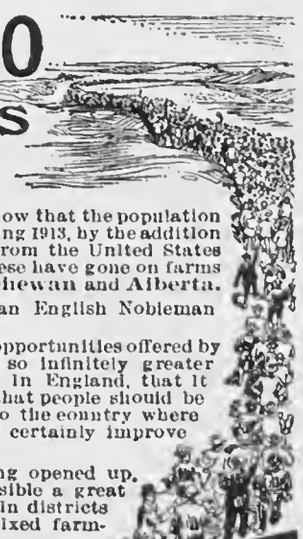
"It's Time To Mend Your Ways"

400,000 Settlers a Year



Immigration figures show that the population of Canada increased during 1913, by the addition of 400,000 new settlers from the United States and Europe. Most of these have gone on farms in Manitoba, Saskatchewan and Alberta.

Lord William Percy, an English Nobleman says:

"The possibilities and opportunities offered by the Canadian West are so infinitely greater than those which exist in England, that it seems absurd to think that people should be impeded from coming to the country where they can most easily and certainly improve their position."

New districts are being opened up, which will make accessible a great number of homesteads in districts especially adapted to mixed farming and grain raising.

For illustrated literature and reduced railway rates, apply to Superintendent of Immigration, Ottawa, Canada, or to the Canadian Government Agent.

Ruralisms

GINSENG CULTURE IN CHINA.

Bulletin No. 90 of the Office of Foreign Seed and Plant Introduction gives the following information about ginseng growing in China, furnished by Mr. N. Gist Gee, of Soochow University, Soochow, China:

The soil is prepared by mixing sand and loam in the proportion of 1:1. The sand is frequently obtained by sifting it from the bed of a nearby stream. In order to get as near as possible to the natural wild environments of the plant, the leaves of the oak or chestnut trees are collected, allowed to decay and then dried. When dry the leaves are crumbled very fine, and then mixed half and half with sand sifted from the hillside. This is obtained by first removing the top layer and getting the unexposed earth. The plants are cultivated on elevated beds about six or eight inches above the pathways between them. These are usually about wide enough for one to work them from one side (about two or 2½ feet). The length of the bed varies with the kind of field, short on hillside, quite long in the valley. Fertilizer one inch thick is spread upon the beds before the seeds are planted. The beds are covered over with sheds with top and one side stationary and a curtain which can roll up and down forming the other side. They seem to keep the plants sheltered throughout their entire period of growth, and regulate the amount of sunlight by the curtains. Before planting soak the seeds in water for four days until they swell and are nearly ready to burst. Then take them out and dry them. This should be done before Fall. In the Fall bury a vessel in the earth in a shady place and put the seeds as already prepared in it, leaving it uncovered. Allow them to freeze, leaving them in the vessel until Spring. Drive nails as large as ginseng seeds in a plank, making them about one inch apart. Use this to plant the seeds regularly about five-eighths of an inch in depth. Place a seed in each hole and cover lightly with the hand. The rows should be about six inches apart. Spray with a very fine stream of water twice a day. Allow the planted seeds to receive the sunlight until the sprouts appear. During all of this time the beds should be protected from rains, but sprayed regularly twice a day. The soil should be kept in good condition by hand cultivation after the young plants come up. This care must be constantly given to the plants. The plants are taken up at the time they are about one year old and only the best ones are saved for transplanting. Many planters do this each year for six years after the plant comes up. Others transplant and select for only the first two or three years. The plants are planted out about six inches apart and in rows about one foot apart. Care must be taken to give the two regular waterings each day during the growing seasons.

The Navel Orange in Brazil.

We referred recently to the expedition sent by the Department of Agriculture to Brazil, for the study of Bahia Navel oranges. Mr. A. D. Shamel, who is one of the members of this party, writes as follows to the Bureau of Plant Industry:

One of the most striking methods that we have found is the practice of orange growers renewing their orchards. They cut back old trees to within about a foot of the ground, allow them from one to three sprouts to grow, from which a new top is developed. A few trees in each orchard are treated in this way each year, renewing the grove as a whole gradually. No means of combating the numerous insects pests and fungus diseases are practised. In spite of the conditions the trees are fairly productive, bearing from 200 to 500 fruits each. Considering the planting, 12 by 12 feet, this means a heavy production per acre. Oranges sell for 10 cents apiece in Rio. Not enough are produced to supply the local demand even at this or higher prices. No fertilizer and usually no cultivation is used. Little pruning except to cut off the lower branches so that people can walk under the trees easily. All labor is hand labor. The fruits are pulled from the trees and handled just like we handle potatoes. The loss from decay in market is very heavy naturally. We have found about all the California Citrus types here, and many others besides.

Rome Beauty and Hudson Apples.

I note what you say regarding the Rome Beauty apple, page 46. I am sorry, for I have planted freely of this kind as a pollenizer of my new kind, "Hudson." At my place, however, no one of all the commercial varieties suffers enough from Winter-killing to put it out of commission. Hubbardston being most tender of any I have grown. Part of the one-year-old Rome Beauties which I received the Spring of 1912 were Winter-killed, but the remainder are growing finely, and I am confident in their future. I consider this particular case of Winter-killing in nursery the result of a most unusual Winter, when much stock was injured in certain locations. If these trees had been grown on my land they would not have been Winter-killed even when yearlings. Rome Beauty, where fruiting in Dutchess County, is very promising, as a very late-keeping apple of fine appearance.

I am sole owner so far as I know of a new apple, named Hudson, originated by S. W. Underhill of Croton on Hudson, and exhibited by him at American Institute Horticultural meeting the Winter of 1901. His tree has been destroyed, but I secured scions from him in 1901, and have four trees top-worked at that time, two of which have born five crops in succession, giving much promise as annual bearers. I have such confidence in the splendid promise of this apple commercially that I set 1,000 Spies in 1912 and top-worked with Hudson. The Hudson was grown from the seed of a fine Spy crossed naturally (supposedly) with Newtown Pippin. It is a red apple of medium size, an exceedingly smooth, finely-shaped, hard apple, a very late keeper and when finally in eating condition in the Spring most people will declare it to be better than Spy or any other kind, no matter how high its quality.

Nine different sprays from same nozzle—round or flat—coarse or fine—starts and stops instantly. Ten different styles. Mail postal for special offer. Agents wanted.

Rochester Spray Pump Co.
195 Broadway, Rochester, N. Y.

Hayes Hand & Power SPRAYERS

Abundant yields and perfect fruit are possible only with efficient spraying. Every leaf and limb must be thoroughly covered with a fog-like mist. It is economy to buy a good sprayer, capable of developing high pressure, easy-working, long lasting and exempt from breakage and expensive delays. Hayes sprayers meet all the requirements of the modern orchardist, from small hand outfits to the largest high pressure power sprayers built.

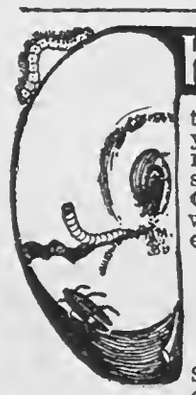
25 Styles. Hand or Power Sprayers for Small or Large Orchards

We make sprayers for orchards, field crops, shade trees, pecans, hops, poultry, painting, home and garden use.

WRITE! Send postal for free book 84 on High Pressure Spraying and complete catalog.

Hayes Pump & Planter Co. Galva, Ill.

Kill These Pests



that ruin your fruit and destroy your trees, vines and plants. Get rid of scale, fungi and worms by spraying. Stahl's Treatise on Orchard Enemies (sent free) will tell you how to do it with easy working—and efficient—

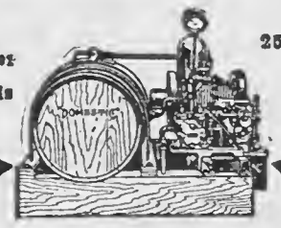
Stahl's Excelsior Spraying Outfits

Send $3 and we will ship outfit complete. Try 10 days and if found O. K. pay balance. If not return and we'll refund your money. Write today

WM. STAHL SPRAYER CO. Box 173, Quincy, Ill.

A new compact power sprayer for small orchards

250 lbs. pressure on 2 nozzles 150 lbs. on 4 nozzles



Valves are brass balls, each one in a separate, removable cage. One and one-half H. P. Junior Engine, water cooled. Strength, convenience of operation, light weight and reliable engine are features in all

Domestic Sprayers

Valves and all working parts can be easily removed, cleaned and replaced. Pump throws a uniform, fine, misty spray. Antomatic agitator stirs the liquid, while a small brush passes over the strainer and prevents clogging. We can furnish you with sprayers for all purposes. Send for a copy of our free book, "Made Money by Spraying."

Domestic Engine and Pump Co., Box 503, Shippensburg, Pa.

SWIFT'S ARSENATE OF LEAD

is sure death to all leaf-eating insects.

Save your apples, potatoes, truck gardens, berries, vegetables, fruit.

15 years' experience back of this pest destroyer which sets the Standard of Excellence. Not always lowest in price but absolutely cheapest in the end. Take no other brand but insist on receiving

SWIFT'S—THE HIGHEST QUALITY KNOWN

For sale by leading dealers. Write for our Apple Book.

MERRIMAC CHEMICAL CO., 34 Broad St., Boston, Mass.

Spray Your Trees Early Any time this winter and early spring when the temperature is not below 40° F. you can spray with "SCALECIDE" and kill the scale, eggs and larvae of insects wintering on trees, as well as spores of fungi that can be reached by a winter spray. Prepare now for a good fruit crop next season.

"SCALECIDE"

TRADE MARK REG. U. S. PAT. OFFICE

will absolutely destroy San Jose and Cottony Maple Scale, Pear Psylla, Leaf Roller, etc., without injury to the trees. It costs less to spray an orchard with "Scalecide" than with Lime-Sulfur—and you secure better results. We back up this claim. Write today for free booklets—"Proof of the Pudding" and "Spraying Simplified".

Write to our Service Department for orchard supplies at money-saving prices.

We are World Distributors for Vreeland's "ELECTRO" Spray Chemicals

and "Electro" Arsenate of Lead Powder (33%) which, used wet or dry, has no equal in strength or texture. Avoid imitations. B. G. PRATT CO., Dept. N 50 Church Street, New York City.

More than 100,000 Farmers and Fruit Growers Use the STANDARD SPRAY PUMP

With it they spray their tallest orchard trees *from the ground* in half the time required by others. The knapsack attachment enables them to spray their potatoes and low growing crops at the rate of an acre an hour or better. They whitewash their barns and chicken coops and spray "dip" on their live stock with the Standard Spray Pump.

Made throughout of brass, with nothing to wear out or break, the Standard Spray Pump lasts a lifetime and pays for itself over and over again.

Warranted 5 Years. Price $4 Prepaid. (West of Denver $5.) Money back if not satisfied.

Send no money but write today for our Special Offer and Catalog M.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rognes, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

THERE seems to be a good opening for high-class canned goods put up on the farm. Direct trade is springing up everywhere, and thousands of people stand ready to buy reliable canned goods when they know where to obtain them at a fair price. We know several farmers who have tried the experiment of putting their surplus fruit and vegetables into cans whenever the regular market price goes down too far. This has worked well and gives a fair profit. There is opportunity in this.

*

THE movement of Danish settlers into Otsego Co., N. Y., is one of the remarkable features of this "back to the land" movement. It is said that no less than 100 more Danish families are planning to come during the year. Their pastor is already here—located on a farm. A brotherhood has been organized and a church will follow. Most of these settlers are below middle age, with good families of little boys and girls, who will be Americanized by the public schools. These Danish people are well educated, and are surely workers, and their coming is a good thing for Otsego County.

*

THE "Coöperative Egg Circle" is a new Canadian farm organization. It seems to have started on Prince Edward Island. From 40 to 80 farmers will organize to sell their eggs coöperatively. The membership fee for an "egg circle" is 30 cents, with 25 cents annual dues. Each member pledges himself to collect the eggs twice a day in warm weather and once daily in cool weather. He also guarantees not to send to the business manager any egg more than seven days from the hen. The manager collects, sorts and ships twice a week in warm weather and once in cool. He must use a covered wagon and is paid one cent a dozen in Spring and Summer and two cents a dozen during the rest of the year. This manager sells the eggs and makes returns to the members. Under this arrangement it is said that farmers receive from two to five cents a dozen more than when they sold to dealers or shipped without organization. And ont of these egg circles will hatch other and larger plans for square dealing.

*

AT the Albany farmers' convention in January a resolution recited that the Western packers drove Eastern farmers out of the business of raising meat animals by competition and discrimination against local butchers who, in years past, when native beef was plentiful, attempted to slaughter meat animals bought from neighboring farms. A representative of one of the railroads rose in the convention and questioned the assertion. As proof of the belief that was in him, he said, he had heard the same complaint some time back, and had written the secretary of one of the packers, whom he knew personally asking if the charges were true. He received a reply to the effect that it was not true.

That certainly is a simple and a confiding way of settling disputes. It ought to do away with all controversy in the future, and incidentally with all courts with their retinue of lawyers and contingent expenses. Ask the thief if he stole a chicken. If he says no, we can be sure that the bird is on the roost, and it is an optical illusion that the owner cannot see it.

WITHIN the past week we have had six cases of threatened lawsuits through failure to understand verbal contracts. One case involves two brothers, another father and son. The parties talked over their business relations and agreed to do certain things. After a few years conditions changed and one party found that he was not getting what he expected. Then they could not agree. One remembered a certain agreement, the other said it was different. There was nothing in writing, and neither party had kept accurate books. In some of these cases there will be a feeling of resentment as long as life lasts. There should always be a strong legal contract whenever people make an agreement to work together or to transfer property or perform some definite service. The expense of hiring a good lawyer to tie up the contract securely is a trifling matter compared with loss and annoyance which follows a loose and indefinite contract.

*

IN your article on page 47 entitled "Two Blades of Grass," you advocate short crops and high prices, because with large crops the farmer may not get all of the benefit of the increased quantity. I judge from this that you object to the use by the farmers, of anything that will produce larger crops. This principle, carried out consistently, will approve of restricting the production of coal to increase the price; the running of factories on short time, for the same purpose and generally retrograding in all matters of production. This is a very narrow minded view of the subject, and one which intelligent farmers will hardly approve of. You cannot deny that abundant crops at fair prices are best for the country at large, and general prosperity does favorably affect the farmer. R.

Your judgment is wrong. We do not object to "anything that will produce larger crops." We have done as much as any farm paper to encourage the use of such things. Our advice to a farmer is to grow his crops on smaller areas instead of scattering them all over the farm with inferior culture. We do not advise him to double his entire crop production until the price minus the cost warrants doing so. This principle has been and is carried out by the very interests you mention. If it is a narrow view suppose we broaden it out and advise all manufacturers to double their production of hardware, shoes, clothing, furniture, etc. They could do this quicker and easier than farmers can. Advise the railroads to double track all their lines and welcome all possible competition in trolleys and cross roads. One is just as fair as the other, but will the railroads and the manufacturers do it? Let them try the "abundant crops at fair prices" theory and see what would follow. From your theory the world would be far better off, since these necessities of life would be cheaper. Why do you ask farmers to do what these other interests refuse to do? We never have denied that abundant crops at fair prices "are best for the country at large." The 35-cent dollar does not mean a fair price. Give the farmer more than that and the abundant crops will follow.

*

ON page 166 we mentioned Bradley Bros. as one firm denied advertising space in THE R. N.-Y. Now we get a note from a Western business man:

We are getting lots of letters from our customers about those people; they put up a pretty coarse job of work. That is about the rawest game I ever saw an advertiser try to put across; it is worse than the wonderberry plant. I don't see how he can expect to put it across with any intelligent people.

The "raw deal" which our friend mentions is about as follows: An advertisement states 12 "Productive" everbearing strawberry plants will be sent "without charge." When the victim asks for the dozen plants he gets this:

The "Productives" being a female plant, will not fruit or bear a crop of perfect berries, unless planted with a male variety like the "Progressive." Now we are very anxious to have you succeed; our gift of 12 special plants of this wonderful new variety is very liberal. We would like to send you the "Progressive" without charge, but we cannot afford to do so. Plant the "Productive" strawberry that we send you free, with equal number of plants of the "Progressive" if you have that variety; if not order some "Progressive" from us; our special proposition is to send you by parcel post, at the same time that we send the 12 "Productive" for $1.25 the 12 "Progressive" and we can send you the 24 plants at the same time by mail postpaid.

That is about as slick a scheme as we have yet heard of. The Greeks were about the craftiest people of ancient times. When they wanted to entice their enemies into trouble they arranged for a number of young men to dress in women's clothing and dance on the shore or where the enemy would see them. Needless to say these dancers carried daggers ready for use and the gentlemen who "answered the advertisement" were most effectively "stung." Bradley Bros. must be great students of Greek literature. The "Productive" plants are used to sell "Progressives" at 10 cents each. It is a "raw deal" which well deserves roasting.

WE ask you to read every word of that story of coöperation by Mr. L. G. Tuckerman. Do not glance it over and let it go, but read it over and over as you would a personal letter. For in this story may be found the basis for a true coöperative organization. These Hudson River fruit growers have struck the real thing. See how their little organization has grown and branched out into great possibilities for selling, handling and financing the local crops. This is the way out for farmers in any community where the farm products are uniform so they can be handled together in large lots. It is coöperation with the CO in large type. This word coöperation is used to cover a multitude of schemes in which a few men get most of the profit and the rest get left. The first thing to understand is that coöperation means equal share of benefits based on labor or business, with no special privilege to anyone.

*

A CURIOUS cream situation is reported from Ohio. There seems to be no standard defining "cream" in the State laws, while milk is standardized and milkmen are held up to it. It seems that the ice-cream dealers froze up the Legislature and got this "joker" through. The trade in selling real cream to the people is growing and can be developed into one of the most profitable lines of the dairy business if a high standard is set for cream and dealers are compelled to face it. Selling pure high-grade cream compares with handling the higher class fruits or other fine products. It is the top notch of good dairying, but there will be nothing in it for the honest man unless a fair standard is made and all are forced to live up to it. Naturally the dealers and handlers have an advantage when the is no standard. They can buy cream and pay for it on a fat test and then sell it to their retail customers with no test at all. There is where the dairymen and farmers of Ohio should get after the Legislature. Work for a law calling for a standard definition of cream. This will not help dairymen alone, but all classes of farmers as well, for whatever helps one is sure to help another.

*

DURING the past year many of our readers have seen advertisements of "Black Fox Farms," some having been offered stock in such enterprises. We have warned our friends as best we could to let such speculations alone. They are gambles pure and simple. Prices for breeding stock of these foxes have been boomed past the bursting point. Last year promoters secured options on the unborn Spring progeny at $10,000 to $12,000 per pair—depositing 10 per cent. of the price. Then they used these options and contracts as assets for their companies and on the strength of such assets offered stock for sale—the money obtained to pay for the young foxes later—if they were born and lived! Thus the man who bought stock in a Black fox farm invested literally in *an unborn fox and a hole in the ground!* Speculative gambling could go no further than that, yet we actually have people argue that the risk is fair one and that the business is sure to be profitable. The argument is that wild fur-bearing animals are vanishing, while the demand for fur garments is increasing. That explains the present rush into skunk farming and similar enterprises, many of which are doomed to failure, since they are based upon the proposition of changing the life habits of naturally wild animals. One reason for the high price for furs is the five-year closed season for fur seals. This five-year term will expire at about the time pelts of these black foxes would come into the market. At present the foxes are sold for breeding purposes at a speculative figure. There is nothing in any such business for those who buy stock in these companies. The fox breeders and the promoters will get all there is in it. Keep out—no matter what big stories they tell you.

BREVITIES.

YOU can root-prune a tree to advantage, but it is hard to do the same to a horse, cow, or man.

THERE is every good reason why a farmer should keep an accurate set of books and not one good reason why he should not.

IT is claimed that Kansas farmers buy 50 per cent. of the vegetables they consume at home. There's a chance to cut out one "trust" with a hoe.

A HARD man to convince is he who will not believe anyone else can do a thing which he has never done. Tell something outside of this man's experience and it "isn't so" at once.

ORGANIZE a "tin-can club" and get the empty cans out of the way. During the Summer a tin can half filled with water will breed enough mosquitoes to make farm life a nightmare.

WEST Virginia is to have a brood of the 17-year locusts this year. We had them a few years since, and they did considerable damage to the soft, young wood. We advise doing no pruning until the locusts have gone.

THE STORY OF A CO-OPERATIVE SUCCESS.

PART II.

ONE WEAKNESS.—In this connection let me go back to Art. VII of our by-laws. The last sentence reads "The members reserve the right to negotiate private sales on which no commission shall be due to the Exchange." Members received the service of the Exchange in market reports and daily prices, and being fully posted would sell to outsiders at those prices to save the three per cent. which they would have paid if selling through the Exchange. They refused to consider that it was the Exchange which made those sales possible, stating that they were only in it for what they could get out of it. You can see how much fairer to all it would be if all sales f. o. b. paid the small commission to the Exchange, and how much stronger the union would be.

BUYING SUPPLIES.—In 1912 our Fall fruits were practically failures, and we took up the buying end. Oats were then selling locally at 66 cents per bushel. Mr. Hilderbrand landed the first carload at Milton direct from Minnesota at 38 cents. More applications for membership! Cheered by that success, he began on bran, middlings, scratch feed, flour, etc., and that first Winter sold 20 carloads at a saving of some $2,500 to our members. We now buy our flour at about $5.25 per barrel landed at our stations, of a grade that we cannot duplicate there for $7.50. We then turn to spray materials and fertilizers. Average prices for commercial lime-sulphur had been $9 to $10 per barrel. We cut it to $5. We also furnish sulphur and lime to those who cook their own stuff at about the same saving. The first year we bought some 250 tons of chemical fertilizer of all sorts at an average saving of $5 per ton. This included a goodly amount of ground rock (acid phosphate), which, as you know, sells around $12 to $14, and pulls down the saving average. On all these purchases the members paid three per cent. to the Exchange.

GROWTH OF BUSINESS.—This first season our actual paid-in cash capital was about $500, and on that we did a business of over $110,000. We ended our first year showing a small margin over and above all outlay in the treasury of the Exchange, but with savings profits to the members on purchases and sales of several thousand dollars. Our second year started with about $1,200 capital, with which we did a business of over $232,000. Of this some $30,000 was f. o. b. sales by the Exchange. Strawberry and pear buyers came to us, and stayed through the season. The ordinary commission house considers 500 crates of strawberries a day as large business. There were many days last season when the Exchange sold 800 to 900 crates a day for its members. About 3,000 barrels of pears were sold to England and a beginning made with apples. Sales covered a wide territory, as our fruits were shipped as far west as Wisconsin, and south into Florida.

FUTURE PROSPECTS.—We have bought to date some 25 carloads of feed, and 21 carloads of manure at a saving of about 25 per cent. The purchases have amounted to $11,000, which does not include this year's fertilizer, upon which we have even lower quotations than last year. We now have 84 members, and the executive committee has decided to recommend that our capital stock be increased, in order that there may be room for those who seem to want to join, also with a view to providing capital for greater work. It seems certain from the experience of this year that next Fall we shall hire cold storage in New York city, and keep our own man there to bill out our apples as wanted for our widening markets.

SOME DIFFICULTIES.—Now I don't want you to leave here with the impression that everything is rosy and plain sailing with such a proposition as I have been talking about. We began small, and we are still creeping along, for it takes time and patience and much work to raise a successful co-operative plan among people who are not used to the idea of working together. In our section I think we are, on the whole, slowly learning the lesson. We have taken up the easiest and most obvious needs. We have not yet reached the point where we can have an absolutely fixed grade and pack for each of our fruits, because we have been going it alone so long that we haven't yet been able to merge. But we are improving, and intend to keep on, though some do not take kindly to proper grading, with the inevitable exposure of their slack methods. This was particularly the case last year, when we had to turn down a hundred barrels of pears which our customer justly refused to accept. In fact, he behaved much more liberally in the matter than was to the best interests of the Exchange, for a very sharp object lesson would have been of great value.

THE NEW CURRENCY LAW.

PART II.

DIRECTORS OF FEDERAL BANKS.—Each Federal Reserve bank must have nine directors in three classes. Class A of three is selected by the member banks of the district to represent the banks. The banks of the district are to be divided into three groups according to size (capitalization), large, medium and small banks, and each group selects one director by ballot by mail, using the preferential ballot. Class B has three directors elected by the banks in the same manner as class A except that class B directors shall be engaged in commerce, agriculture or some other industrial pursuit. The three directors of class C are appointed by the Federal Reserve board. All directors hold office for three years, and one of class C is appointed the chairman of the board of directors. (The first board of directors elected or appointed for one, two and three years until the system is organized.) The board of directors performs the duties usually appertaining to the duties of the office of bank director and conducts the affairs of the Federal bank without discrimination between the member banks.

EARNINGS OF THE FEDERAL BANKS.—After all necessary expenses have been provided for, the stockholders are entitled to six per cent per year dividend on the paid-in capital stock. After the expenses and dividends are provided for the net earnings shall be paid to the United States as a franchise tax, except that one-half of the net earnings up to 40% of the capital stock of the bank shall be paid into a surplus fund. The profits derived by the government from the operation of the new system shall, in the discretion of the Secretary of the Treasury, be used to supplement the gold reserve against outstanding United States notes, or to the reduction of the National debt. The earnings of the Federal Reserve banks are derived from its transactions with the government and its member banks. "Any Federal Reserve bank may receive from any of its member banks, and from the United States, deposits of current funds, national bank notes, Federal reserve notes, or checks and drafts upon solvent member or other Federal reserve banks, payable upon presentation. Upon the indorsement of any of its member banks, with a waiver of demand, notice and protest, any Federal reserve bank may discount notes, drafts and bills of exchange arising out of actual commercial transactions; that is, notes, drafts and bills of exchange issued or drawn for agricultural, industrial, or commercial purposes, or the proceeds of which have been used, or are to be used, for such purposes, the Federal reserve board to have the right to determine or define the character of the paper thus eligible for discount, within the meaning of this Act. Nothing in this Act contained shall be construed to prohibit such notes, drafts, and bills of exchange secured by staple agricultural products, or other goods, wares, or merchandise from being eligible for such discount; but such definition shall not include notes, drafts, or bills covering merely investments or issued or drawn for the purpose of carrying or trading in stocks, bonds, or other investment securities, except bonds and notes of the United States Government. Notes, drafts, and bills admitted to discount must have a maturity at time of discount of not more than ninety days: Provided, that notes, drafts, and bills drawn or issued for *agricultural* purposes or based on live stock and having a maturity not exceeding *six* months may be discounted in an amount to be limited * * * by the Federal Reserve board." Federal banks also discount drafts and bills of exchange on imports and exports to a limited extent. Federal banks also may deal in gold coin and bullion and make loans thereon; may buy and sell, at home and abroad, bonds and notes of the United States, and bills, notes, revenue bonds, and warrants issued by State, county, districts, and cities in the United States, and may receive government deposits.

FEDERAL CURRENCY.—The new currency, Federal reserve notes, will gradually replace our present national bank notes. The new notes will be issued "at the discretion of the Federal Reserve board for the purpose of making advances to Federal banks" in exchange for collateral of the Federal banks. These Federal notes "shall be obligations of the United States and shall be receivable by all national and member banks and Federal reserve banks, and for all taxes, customs, and other public dues. They shall be redeemed in gold on demand at the Treasury of the United States, or in gold or lawful money at any Federal bank. The Federal banks make application for these notes in any amount that they require. They tender to the government an equal amount of commercial paper. "The collateral security offered shall be notes and bills," to which reference has been made. In other words a farmer may go to his local bank and secure a six months loan on his wheat. His local bank sends this to its district Federal reserve bank and the Federal bank tenders the note to the Government and gets the face value of the note in Federal notes. The Federal bank must hold a reserve of 40% in gold against the Federal notes, 5% of this reserve in the U. S. Treasury. It must also keep 35% in reserve in gold or lawful money to protect the deposits of member banks. F. N. C.

NEW YORK STATE GRANGE.

PART I.

The recent session of the New York State Grange at Poughkeepsie measured up well with any previous sessions with which the writer has been familiar. A large number of measures were brought before the convention for the delegates to consider and their action was sane and commendable. And nothing escaped their careful attention. If a committee's report on resolutions submitted to it were not to the liking of the delegates they did not hesitate to reverse the report, and this occurred in several instances. The report of the committee on assessment and taxation is worthy of notice here. Its declarations were as follows: "We favor uniform State tax laws throughout the Union. We favor a system of scientific assessment by assessors free from political influence. We favor an income tax collected at its source so far as possible. We favor an annual mortgage tax. We believe that the amount of a mortgage against a property should be deducted from its assessed valuation. We urge our legislative committee to use their utmost endeavor to defeat all legislation in the interest of the single tax system." The recommendations of the committee were adopted.

The committee on public schools favored the introduction of the study of agriculture in the public schools, but they believe that these studies should be adapted to the various sections where the schools are located. In other words, that the school divisions of the State should be given local option on the courses of study to be pursued in their respective localities so that it may be adapted to local conditions and requirements. This committee also recommended that a committee be appointed to represent the Grange to work with committees from other organizations in devising a better course of study and management for our common, union and high schools. The committee on parcel post had but little before it for consideration, possibly because everything is working so well along the postal routes. It was the expression of the Grange that the delivery of mail to all rural homes be accomplished as soon as practicable. In regard to postal savings the committee favored the distribution of treasury funds among rural banks rather than metropolitan, and the establishment of a system of farm credits to benefit the farmer. With these recommendations the Grange agreed.

The public health committee, as it will hereafter be known, informed the Grange that in its opinion a new day was dawning in health work. The new public health law, the new vital statistics law, the medical school and inspections law, have all been written on the statute books within a year. In the enactment of these laws the State Grange and Subordinate Granges as well, exerted a great influence, working through the tuberculosis committee of the State Grange. The Granges sold Red Cross Christmas seals to the amount of $1,950 this year, as against $1,271 last year. A large part of this money goes to the work which the standing public health committee is doing to advance the tuberculosis campaign in the rural districts. Much needs to be done. While the death rate in New York city last year was 13.7 per 1,000 of population, in the rural districts it was 15.4. More attention should be paid to rural health conditions. The Grange favored the recommendation of the committee that a division of rural hygiene should be established in the State Department of Health.

The following amendment to the commission merchants' law was suggested by the resolution offered by Senator Godfrey: That commission merchants be required to make, and keep for the period of one year, a record containing the name and address of the purchaser of produce shipped to them for sale on commission, the date of such sale, quantity of each lot of produce sold and the price paid therefor, and a copy be forwarded to the shipper when returns for such sales are made. The resolution was approved by the Grange. J. W. D.

World Crops.

The Department of Agriculture reports that the world's wheat crop passed the four billion bushel point last year for the first time, reaching a total of 4,125,658,000. This is 298,571,000 bushels more than the previous year. Since 1902 the world's supply of wheat has run between three and four billions.

In value of farm crops Texas surpassed all other States producing more than $400,000,000. Then in order came Iowa, Illinois, Georgia, Ohio, Minnesota, Indiana, Missouri, Pennsylvania, Nebraska, Alabama, Wisconsin, North Carolina, New York, South Carolina, Mississippi, Kansas and Michigan.

Potatoes in First Hand.

The Department of Agriculture estimates that 42.1 per cent of the 1913 potato crop remained in farmers' hands January 1, compared with 39.8 per cent the previous year. This would indicate a total available supply of 123,000,000 bushels in the chief producing States, against 150,000,000 the year previous. The estimated supply in grower's hands by States is as follows: New York, 14,630,000 bushels; New England States, 17,874,000; Pennsylvania, 8,854,000; Ohio, 2,652,000; Indiana, 1,200,000; Illinois, 1,218,000; Michigan, 16,964,000; Wisconsin, 17,066,000; Minnesota, 11,174,000; Iowa, 1,440,000; Nebraska, 1,539,000; Colorado, 5,060,000.

The Originators of Sanitary Barn Equipment Ideas Have Made JAMES Equipment *Easy to Erect*

PLEASE look at the pictures in the lower right-hand corner of this advertisement. They tell you the story of *the greatest plan in barn equipment* we have ever developed.

It is a plan that reduces the whole proposition of erection to absolute simplicity. It enables any man who is building or remodeling his barn to *begin at once* on the work of equipping it.

You Can Start Cementing Tomorrow

This new method is applied to the same JAMES standards now found in thousands of the best barns throughout the country. Mr. James and his associates are recognized as the *originators* of sanitary barn equipment ideas.

The barn principles—*proved right*—that we have been presenting to builders of barns year after year, remain as they were. All the fundamental ideas that have brought *success* and *profit* to barn owners everywhere are preserved.

We simply make James Sanitary Barn Equipment *better than ever* by providing a new and easy way of erecting—a way that makes it unnecessary for you to delay your cement work or any other building operation a single day.

When ready to begin, all you need do is to get the required number of JAMES Anchors.

You can get these *immediately*—by express if you want to begin cementing at once—from Ft. Atkinson or some nearby distributing point.

If your cement men are ready to go to work, *have them come ahead.* You will be ready for them, *the* JAMES *way,* because you need only the Anchors in order to begin work.

Set these Anchors—which later are to hold the stall posts—in your cement curb and go right on finishing up the floor of the barn. By the time you are ready for it, your JAMES equipment will be on the ground.

Please study the lower right-hand pictures for clear proof of why *you can start work tomorrow.*

Superior Service and Superior Quality

Besides easy and quick erection, you receive the benefit of all the skill, ingenuity and experience of recognized *barn authorities.* We are *inventors, discoverers* and *pioneers* in the work of making dairy barns efficient. We are thoroughly familiar with every phase of the dairy business, and know the needs of dairy farmers in the arrangement, designing, construction, equipping, ventilating and lighting of their barns.

No owner of a dairy barn—no barn builder—no architect—can afford to be without JAMES service. Our ideas have been *proved right* before being offered to the public, and in announcing this new, quick, easy way of installing JAMES Sanitary Barn Equipment we are putting the capsheaf on our record of accomplishment for barn owners everywhere.

Results of Our Work as Originators

Here are the main points upon which rest the claims of the JAMES Manufacturing Company as *creators* of better barn conditions, *inventors* of better methods in handling barn work, *master builders* of dairy barns.

Alignment Device

Stanchions are adjusted forward or backward, so that stall is lengthened or shortened to fit the cow. Long, medium and short cows are lined up at the rear—litter falls in gutter and not on standing platform. Cows are kept clean—less bedding is needed—your work is made easier—cows are kept healthier and give more milk.

Double Chain Hanger

Allows you to build a level curb six to eight inches high; prevents waste of feed. No complicated curb forms to cut out and build—no forms to be sent from factory. Stanchion hangs low—cow's head, when she is lying down, may be within ten or twelve inches of the floor; bottom of stanchion never interferes with cow's comfort. Double chain separates hanger from the hinge—throwing all the strain on side bars of stanchion.

Sure Stop Swinging Post

Insures *cow comfort*—gives cows the same freedom of movement as though in the open yard. Allows cow the same room at the head as at the rear.

When Sure Stop is in place and stanchion open, the cow when entering the stall must put her head in the open stanchion. When cow is locked in the stanchion, Sure Stop is swung back out of way; she can card herself freely on either flank and lie down naturally, with her nose on shoulder.

All Swinging Sure Stop Posts, for an entire row of stalls are opened or closed at the same time from any stall in the row.

Self-Cleaning Mangers

JAMES Mangers make possible feeding each cow individually—prevent abortion and other injuries caused by cows straining to get feed thrown out of reach—prevent feed waste—promote cleanliness and sanitation.

Manger has no bottom, a trough in the concrete floor serving that purpose; mangers easily lifted and trough quickly cleaned—may be flushed out and used for watering.

Manger-Lifting Springs

Weight of manger regulated by heavy flat springs—hold manger down so cow cannot lift it with horns; hold it up when manger is raised. Springs cold-drawn, oil-tempered—tested for severe use—same quality as automobile springs—tension easily adjusted.

Triple Curve Stall Partition

Protects both cow and milker; prevents injuries caused by a cow stepping on the udder of a neighbor lying down; keeps each cow in her own stall all the time.

Peculiar curve of partition permits cow to turn her head, and leave stall naturally instead of backing out over the gutter.

The James Anchor

Gives stanchion a firm fastening to concrete curb; is easily set and makes quick placing of stanchions possible. So designed that should a bolt break or threads strip, it may be quickly replaced. Anchor hot galvanized.

James "No Dust" Sanitary Fitting

Edges of the two parts of the fitting overlap so that when drawn together no openings are left to catch dust.

Calf Stanchions, Mangers, Pens

Save labor in caring for the calves; make feeding of milk easy; break calves of the sucking habit; provide calves with clean, dry, comfortable quarters with plenty of light and ventilation.

Of panel construction, easily erected; with JAMES tubular pen anchors; wrench only tool required.

Cow Pen and Tilting Feed Box

A roomy, dry, clean maternity pen or box stall, of panel construction, easily erected with JAMES tubular pen anchors; interferes least with ventilation and light.

JAMES Tilting Feed Box takes up but little room inside the pen. May be tilted out to put in the feed—tilted in while the cow is eating. May be dropped to alley floor for cleaning.

Bull Pen

The bull need be no longer tied by a ring in his nose, but can be turned loose to move about with freedom. Simplifies and makes safe the handling of the bull. When necessary to enter pen, bull can be fastened in the stanchion. Pen is of panel construction, easily erected with JAMES tubular pen anchors.

I-Beam Carrier Track

Patterned after railroad rails—very strong—can not sag or spread—quickly and easily bent to any curve without heat while it is being put up—saves cost of special curves. Easy to erect; can be hung high or low, wherever there is room for the tub to pass.

This deep track stands long years of wear; rounded wheel surface reduces friction to minimum—makes carrier easy running.

Button-On Hangers

To put up track, button of hanger is inserted in hole in the track, hanger is turned to position and fastened to joist or ceiling. Holds the I-Beam Track always firm. No bolts or nuts used in attaching hanger to track—nothing to rattle or work loose.

Friction Brake—Non-Slipping Clutch

Not necessary to pull the JAMES tub down; tub quickly lowers by its own weight—friction brake keeps speed of descent always under absolute control—saves time. A slight pull on the control lever slacks speed regardless of weight in tub, a stronger pull stops descent.

Friction Brake and Clutch are both controlled by one lever; when lever is pulled down it acts as a brake—when released entirely as a clutch—holding tub firmly at that exact point.

James Combination Carrier

Has all the advantages of I-Beam Track inside the barn and of Rod Track outside; stand at the barn door and give the carrier a shove—it runs out, dumps automatically and returns to the barn.

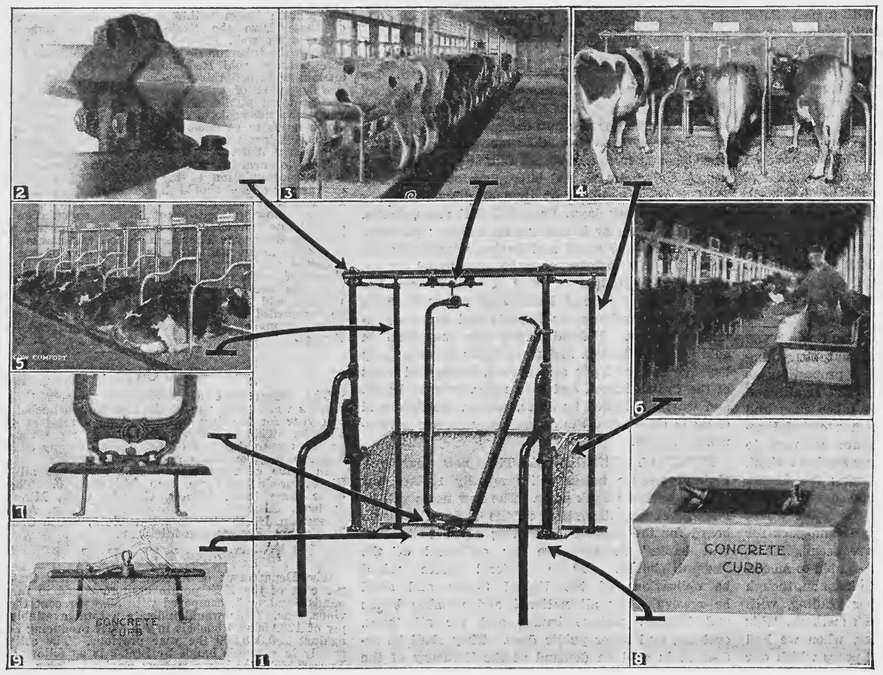
James Individual Watering Buckets

A bucket for each cow; prevents the spread of contagious diseases through the water supply. Each cow gets fresh, pure water direct from a protected tank. Float feed keeps clean water in every bucket.

James Ventilator

A wonderful suction ventilator, by means of which foul air is drawn out of the barn; ventilating efficiency of any system positively increased from 30% to 65% by the use of this right principle.

And now we have added the greatest feature of all to—



1—James 14A Stall complete; 2—James Sanitary Fitting; 3—Alignment device lines all cows evenly over the gutter; 4—Sure Stop permits perfect *cow freedom;* 5—Sure Stop makes *cow comfort* possible; 6—Self-cleaning Manger; 7—Double Chain Hanger; 8—Concrete Curb, arrow pointing to position of curb and anchor below stall post; 9—Detail picture of alignment device.

JAMES Sanitary Barn Equipment

It means quick action. If ready to equip your barn now, don't worry about delays. Just get JAMES Anchors and go ahead.

Please refer again to pictures to the right of this—in lower right-hand corner. Here is the complete story of quick, easy erection.

No. 1—Cement worker placing JAMES Anchors in soft cement of the curb. Anchors—which are the only things you need in order to begin work at once—are shown on the ground behind. After anchors are in, the work of cementing the barn floor proceeds without delay. Meanwhile your JAMES equipment is on its way to you.

No. 2—Placing stall posts on bolts inserted in anchor plate. Tightening of bolts then fastens post firmly to the curb.

No. 3—Attaching our new square horizontal pipe to upright posts. Note that all fittings are in their proper places on equipment when you receive it. Loosening and tightening of bolts all that is necessary in erection. No searching for the proper parts—no lost parts—everything simplified so that a boy can understand it all.

No. 4—Attaching stall partition—one end being bolted to upright, the other imbedded in the barn floor.

No. 5—Attaching stanchion alignment device to fittings—which are already in their right places on horizontal pipe when you receive shipment. Lower end of stanchion is held to the curb by special anchor shown in illustration at left.

No. 6—Placing Sure Stop Swinging Post on flanges of upright fittings. These flanges have strong pins or buttons on which the sure stop is hung in a second—insuring strength, easy action and quick removal when desired.

No. 7—Showing the connecting rod which moves all the sure stops at one time. Placing this rod in position, like all other parts of the job, is the easy work of one man.

No. 8—Attaching the manger division to fitting already in place on upright post.

These pictures show the erection of the JAMES 14C Stall.

Stall 14A is erected in exactly the same way, excepting that our 14A Stall has the complete manger, instead of the manger division.

Other New Features

Horizontal pipes are now square—or quadrangular—instead of round. This means that the fittings are so firmly held that they cannot twist on the pipes.

Built pens, cow pens and calf pens are just as easy to erect as the stalls; anchors are set in place when the concrete floor is being laid—the pens can be set up at any time later. The hard work of erecting the pens is done away with; the pens reach you all assembled in panels—you merely set the upright posts in place and bolt the panels to them. It is no longer necessary to set each upright pipe in the concrete floor.

Another big improvement in our method of manufacture is that we are baking all paint on the equipment. All piping is mechanically cleaned, removing scale, grease and foreign matter, thoroughly preparing the piping for painting. A primer is first applied and thoroughly baked. The enamel is then put on, and baked. That makes a lasting protection—one that will resist blows without flaking off. All JAMES piping is painted inside and outside, leaving no place for rust to attack.

Assembled Stalls—Knocked Down for Easy Handling

JAMES Equipment will reach you in five assembled groups—all nested and bundled. Fittings are in their proper places on the piping. No boxes filled with small parts—no long lists of little pieces—no complicated directions.

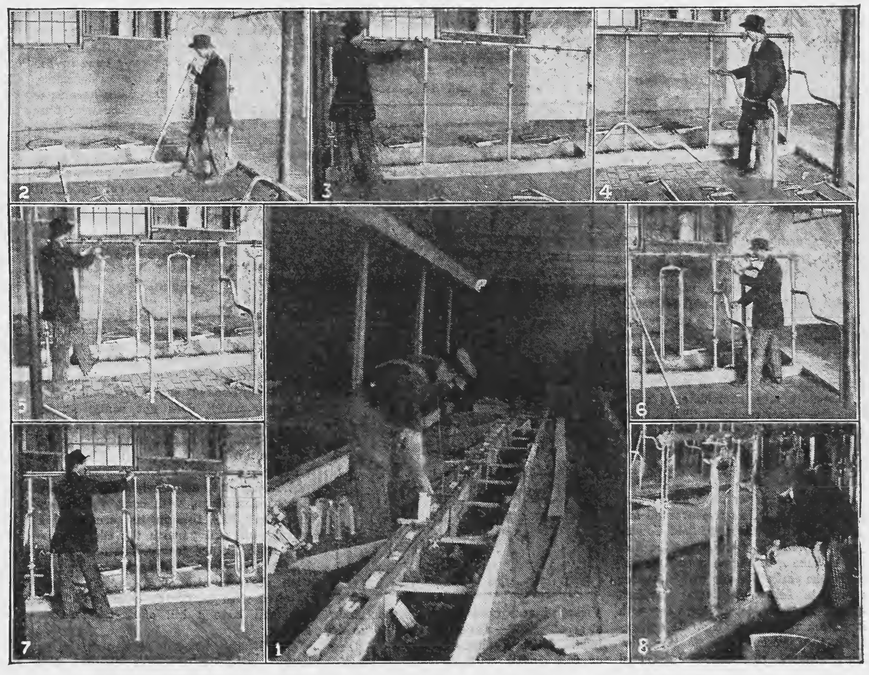
You can't go wrong in erecting JAMES Equipment. One man can do all the work.

Don't lose time. Get full information now about the equipment built by these *originators* of sanitary barn equipment ideas, and the new plan that means *immediate* and *easy* installation service.

James Manufacturing Company

BM30 Cane Street, Ft. Atkinson, Wis.

"Originators of Sanitary Barn Equipment Ideas"



1—Placing James Anchors in soft cement of the curb; 2—Placing Stall post on the anchor bolts; 3—Attaching new square horizontal pipe; 4—Attaching stall partition; 5—Attaching stanchion alignment device to the fittings; 6—Placing Sure Stop Swinging Post on flanges of the upright fittings; 7—Placing connecting rod in position; 8—Attaching the Manger Division.

Woman and the Home

From Day to Day

THE FLAG.

Your Flag and my Flag!
And how it flies to-day
In your land and my land
And half a world away!
Rose-red and blood-red
The stripes forever gleam;
Snow-white and soul-white—
The good forefather's dream:
Sky-blue and true blue, with stars to gleam aright—
The gloried guidon of the day; a shelter through the night.

Your Flag and my Flag!
And, oh, how much it holds—
Your land and my land—
Secure within its folds!
Your heart and my heart
Beat quicker at the sight;
Sun-kissed and wind-tossed,
Red and blue and white.
The one Flag—the great Flag—the Flag for me and you—
Glorifies all else beside—the red and white and blue!

Your Flag and my Flag!
To every star and stripe
The drums beat as hearts beat
And fifers shrilly pipe!
Your Flag and my Flag—
A blessing in the sky;
Your hope and my hope—
It never hid a lie!
Home land and far land and half the world around,
Old Glory hears our glad salute and ripples to the sound!

—Wilbur D. Nesbit.

*

MANY housekeepers keep lemons by putting them in a jar of cold water. A fruit-grower says that a better way is to wipe the lemons carefully with a soft woolen cloth, avoiding pinching or bruising, then wrap each lemon separately in paraffin paper. Store in a box, in a cool dark place.

*

IN considering some of the dark tragedies that involve young women, as depicted in the daily papers, one is often struck by their determination to secure personal happiness or gratification at any cost, regardless of the rights or sufferings of others. Putting aside the question of moral and religious principles, is there not something wrong in an educational system which seems to exaggerate the ego to such abnormal proportions? We are not referring here to those reared in poverty and deprivation, with no recreation ground but the street, but to young people reared in comfort, who have had all the advantages of ordinary education. Is it the school, the home, or the standards of social life that make them unable to withstand such temptations as are common to humanity?

*

MOURNING crape is expensive, perishable, and costly to restore, if a professional cleaner is employed. The following method is advised for home renovation: Carefully brush and shake the crape to remove all dust. Place a folded sheet on the table, pin the crape to it, keeping perfectly straight and flat, but without stretching it. Dissolve one teaspoonful of granulated sugar in a pint of boiling water, and moisten a clean cloth with this. Lay the damp cloth lightly on the crape, then go over the cloth with a very hot iron, without touching it. The operator should go over the damp cloth carefully, just as though ironing it, but never touching it; actual ironing would ruin the crape. This is continued until the cloth is nearly dry, when the cloth may be moistened again and the process repeated. This steaming carefully done, restores the crispness and deep crinkle of the crape, so that it looks new.

*

A RECENT newspaper note states that Miss Elizabeth M. Kilbourn, over 80 and recently lying ill in the Litchfield County Hospital in Winsted, Conn., was the first woman to take a stitch on a sewing machine. In the early '50s she was a teacher in a private school in New Hartford when Elias Howe was experimenting with his invention in a dingy shop in a basement on the present site of the New Hartford House. She became interested in his invention and was finally permitted to operate it.

"There, you are the first woman in this world who ever took a stitch on a sewing machine," Howe said to Miss Kilbourn when at his invitation she tried the machine.

At that time there was no pedal arrangement and the operator had to turn the wheel by hand. Two needles were inserted in the machine, as Miss Kilbourn remembers it. Elias Howe was very poor in those days and sharpened knives and did odd jobs for a living in his basement shop. When he had perfected his sewing machine he went to Bridgeport, and shortly afterward Wheeler and Wilson moved there from Watertown, Conn., and the three combined, and Howe died rich.

The Rural Patterns.

When ordering patterns always give number of pattern and measurements desired.

8147—Blouse coat for misses and small women, 16 and 18 years. With three-quarter or long sleeves. 8140—Cutaway

coat for misses and small women, 16 and 18 years. 8141—Short coat, 34 to 40 bust. With three-quarter or long sleeves. 8134—Loose coat, 34 to 44 bust. To be buttoned up closely at the throat or rolled open to form revers, with straight or curved fronts. Perforated for shorter length. 8170—Coat in Russian style for misses and small women, 16 and 18 years. With three-quarter or long sleeves.

8168—Fancy blouse for misses and small women, 16 and 18 years. With

V-shaped or square neck, short or elbow sleeves. 8142—Fancy blouse, 34 to 40 bust. With Japanese sleeves in elbow or full length, with or without chemisette. 8166—Semi-princess dress for misses and small women, 16 and 18 years. With one-piece skirt, V-shaped or round neck, with or without under sleeves. 8154—One-piece draped skirt, 22 to 32 waist. With high or natural waist line. 8143—Two-piece draped skirt, 22 to 32 waist. With or without tunic and train, with high or natural waist line. Price of each pattern, 10 cents.

A Salmagundi Party.

For the hostess who is not quite certain as to her ability to entertain a party of friends without cards or dancing, the salamagundi party is a happy solution. The very name will serve to arouse curiosity, and those not familiar with this form of entertainment will be eager to come and find out what it is like.

In sending out your invitations, write across the top of your notes or cards, "An evening with Salmagundi." Arrange your rooms tastefully, but remove all unnecessary pieces of furniture, to make room for six or eight small tables, according to the number of guests you have invited, these should be large enough to seat four, and can be placed in the corners and center of the room, or wherever there is space large enough. If one room happens to be too small for so many tables, two adjoining rooms can be used just as successfully.

In the center of each table arrange some simple game, each of a different character, of course. Cut white letter paper into long, narrow strips, four for each table, and mark the first set A1, A2, A3 and A4; the second B1, B2, B3 and B4, and so on until each table is provided with a set, then place the slips in a box, shake, and allow each guest to draw one; those drawing one and two will be partners, against those drawing three and four, and at every table the game is played for a specified time. When the time is up the scores are put down on the slips by the players, counting one for every win. Those winning move on to the next table, the losers remaining where they are for another trial. Those winning at the table marked A go on to table B, and those at the last table—say table F, if there are six tables, to table A, and in this way until all the games have been played, those winning all, or the most games, first, are awarded prizes.

Games that are easy and will create much merriment should be choosen. Picking up beans with toothpicks is great sport; the beans are piled in the center of the table, and the player with two toothpicks in his right hand sees how many beans he can pick up. The winners are those who have picked up the greatest number.

Building card houses is another; the one who is able to built the highest house without toppling over once in the attempt, wins. Fish pond is an old game, and very amusing. Threading needles is another; this table is supplied with four reels of cotton and four medium-sized needles, and whichever threads the most needles, is the winner. Table croquet, dominoes, ludo, tiddly-winks, and similar games are suitable for an entertainment of this kind.

After the prizes are awarded, which may be some fancy little articles, made by the hostess herself, for the ladies, and something simple and unique for the men, the refreshments are served.

On the bill of fare for a "salmagundi party" should be the old-fashioned dish, called salmagundi, meaning a miscellany, and from which the party really gets its name. This is, as every one knows that is familiar with it, a mixture of chopped meat, hard-boiled eggs, anchovies, and cabbage, which does not sound at all tempting for an evening affair, nevertheless, it can be modernized into a very attractive dish, in this way: Mix equal parts of cold cooked chicken meat, chopped rather fine, and finely chopped crisp uncooked cabbage, with some good salad dressing. Pile this in the center of a salad bowl, and garnish the edge of the dish with lettuce leaves, slices of hard-boiled eggs, and a few anchovies; served with plain bread and butter folds and followed with ice cream, cake and coffee, you will have a bill of fare fit for a king.

Or, if the hostess prefers to serve lighter refreshments, she might have simply the bread and butter folds, olives, chicken or cheese sandwiches, followed by cake and cocoa or coffee.

ROSAMOND LAMPMAN.

$2,000 Crop from a Small Tomato Patch

John DeBoer raised 2,000 plants from the seed of our new early variety of tomato to test its merits for commercial purposes. The plants received only the ordinary care and cultivation, yet Mr. DeBoer marketed—a few weeks later—$2,000 worth of tomatoes from the 2,000 plants!

Rowe's Grand Rapids Market Tomato

is large, fine shaped, and a beautiful deep rich pink in color. Its meat is solid—cutting this tomato is like cutting a rich, juicy beefsteak—and it has but very few seeds. The flavor is delicious. Rowe's Grand Rapids Market Tomato is the earliest ripening of any heavy yielding commercial variety. It is uniform in size—each full grown tomato averaging about a half-pound—nearly the entire crop will grade as fancy. It is a splendid shipping variety.

Our Special Free Seed Offer

We are the originators of this wonderful new variety and the seed cannot yet be secured from anyone but us. To introduce our publication—

The Fruit Belt

to readers of this paper, we will give a package—containing about 100 seeds—of Rowe's Tomato Seed free with each subscription to this progressive paper for fruit and vegetable growers. Price, one year, 50c; Canada, 75c. Coin or stamps.

Accept this offer today—the number of packages is limited—you will get much practical information from reading "The Fruit Belt" as well as enjoy the fine, luscious tomatoes you raise from this seed.

THE FRUIT BELT, Box GRAND RAPIDS, MICH.

Post's Improved Eureka Sap Spouts

FREE SAMPLES! See Them! Try Them!

They Give **More Sap** every day for **More Days** and make **More Money** for you than any other, and there is a scientific reason for it, explained in our Free Catalog.

New York City

"Other Ways" With Potatoes.

"Old potatoes," between April and July, are the bane of many a rural housewife, who may be glad to try some of the ways in which our mother made them palatable for a large family. Here are some of the recipes, all of which presuppose that the potatoes have been kept from sprouting, and that they have been soaked in cold water several hours before paring:

Potato Soup (really "mock oyster).—A quart of boiled potatoes, mashed while hot, seasoned to taste, with plenty of butter, to be stirred into two quarts of milk and brought to the boiling point, but not allowed to boil. Put a cover on the kettle, and set it back on the stove, while preparing 12 slices of buttered toast, one half of which will be kept hot in the oven, and the rest distributed among the six hot soup plates, which this quantity will serve—and bountifully. Pour the soup over the toast, and serve at once. "Make more the next time," has always been enjoined, but the "enough" point was never reached!

Potato Balls.—Into a quart of mashed potatoes beat one egg and two cups of bread crumbs. (These are made by rolling with the rolling pin the pieces of bread which are left from nearly every meal, after they have been thoroughly dried in a hot oven). Add half a cup of flour, and a fourth of milk. Shape into "balls"—not disks—and fry in deep fat as you would doughnuts. Lift out with a skimmer (if made right they are too tender for a fork) to a hot plate and set in the open oven until ready to serve. Stewed tomatoes, or cabbage salad, are proper to serve with these delectables.

Another Kind.—To the same quantity of mashed potatoes, add half as much boiled rice and a cup of milk. Beat in an egg, whipping all until very light. Form into disks, over which sprinkle a light coat of flour on both sides. Fry to a light brown in a not too hot frying pan in which a generous supply of pork fat (ham, bacon or any pork fat) has been put to melt. Be careful in turning to fry on the opposite side not to break or make them look ragged.

Stuffed Potatoes.—Scrub with the vegetable brush, and cut off any specks from the skin, a dozen medium-sized potatoes, rather round in shape. Wipe dry, and grease with beef or pork fat or butter, and bake in a rather quick oven. Heat a frying pan and fry until crisp six thin slices of larding pork or of rather fat bacon. Take out on a warm dry plate, draining each slice free from all fat. Remove the rind, and cut the slices into tiny bits. Mix into a cup of bread crumbs or boiled rice, with two hard-boiled eggs cut into bits, moistening with half a cup of milk and add two tablespoonfuls of flour and half a teaspoonful of salt. As soon as the potatoes are done remove from the oven and, handling with a clean napkin or towel, cut each potato in half, crosswise, and dig out the inside, leaving the shells on a long shallow baking tin, ready for the filling. Mash the hot potato with a fork, being sure that no lumps are left. Add the above mixture, stirring all thoroughly, and fit each shell, rounding it up high and making it smooth. Set in a moderately hot oven to brown lightly.

Scalloped Potatoes.—Pare, then chop into not too fine pieces, potatoes enough to make two quarts. Butter a pudding dish; and butter several slices of bread, lightly. Put in a layer of potatoes, and sprinkle lightly with salt. Cover with the bread slices. Add more salted potato, topping with more bread, and continue until the dish is full—the last layer being bread, the buttered side up. Bake in a slow oven 45 to 60 minutes. Bacon and eggs, with cold slaw or cabbage salad are "good company" for this.

Creamed Potatoes.—Slice them thin, whether cold, boiled or raw. Heat a frying pan and put in enough fat of beef, pork or lamb to cover the bottom. Put the potatoes in, and cover scantily with water. Put on the cover, and cook until done. Drain off every bit of water, and shake the frying pan over the open fire for a few seconds, to let the steam dry out of the potatoes. Add salt to taste, and dredge flour freely over the potatoes, as they sit on the hot stove. Pour on milk or cream, and cover for a few seconds—after adding some more fat, of the sort used, a tablespoonful to a pint of potatoes. Turn over lightly, lifting from the bottom of the frying pan, so that none will stick. Put into a hot dish, and dot the top of the potatoes with butter, adding a dash of pepper and two dashes of powdered celery—the leaves dried for this purpose.

Potato Salad.—Wash a cup of rice, and put it over a hot fire to boil in three cups of cold water, to which a teaspoonful of salt has been added. Cover at first, but remove the cover when the rice "hops," and shake it, holding away from the fire, until sure that none sticks. Replace it and clean six large potatoes, cutting them in quarters. Boil, with three eggs in same kettle. By the time these are done the rice will be also, and can be set on the back of the stove while you peel and slice the potatoes very thin, shell the eggs, and cut into small pieces, adding salt, pepper, butter and mustard to taste. Add the rice and potatoes, mixing them then with the eggs, to sit while you prepare a "dressing" of one tablespoonful melted butter, two of sour cream (or olive oil), pouring it over the salad while the ingredients are yet warm. When thoroughly mixed add a tablespoonful of sharp vinegar, mixing all with a silver fork. (Taste, now and then, to get the seasoning proportioned right for family. Tastes vary so!) When done, sprinkle a tablespoonful of powdered celery over all, and set the big bowl of "luscious old potatoes" away to cool.

Hashed Brown Potatoes.—Pare, slice, and dice eight medium raw potatoes, and cover with cold water. Put a small half cup of fat into a hot frying pan. Drain off all the water, and put in the potatoes, with salt and pepper to taste—all under cover over a brisk fire for 10 minutes, a slow fire after that. When done remove the cover, and return to the fire for two minutes. Sprinkle with powdered celery, and turn out on a hot platter, the brown side up. Stewed tomatoes are good with both the above.

Potato Loaf.—Mash the potatoes in the usual way, but be rather more than usually generous with butter and milk. Beat with a fork until very light, then beat in an egg for every pint of potatoes, and three tablespoonfuls of flour. Turn the mixture into a buttered pudding dish, smooth off the top, and bake 20 minutes to half an hour. Serve from the dish, with cold ham or corned beef.

LUCY A. YENDES.

Grace Before Meat.

In response to a request for grace before meat, or "asking a blessing," for children, a correspondent of the London Spectator gives the following:

"Here is one by Herrick which my children say before their mid-day dinner:

What God gives, and what we take,
'Tis a gift for Christ His sake.
Be the meal of beans and pease,
God be thanked for those and these.
Have we flesh or have we fish,
All are fragments from His dish.
He His church save and the king,
And our peace here like a spring,
Make it ever flourishing.

"For a singing grace to the tune of the Old Hundredth we have:

Be present at our table, Lord,
Be here and everywhere adored.
These creatures bless, and grant that we
May feast in paradise with Thee.

"'Gratias,' graces or thanks for a child, I find rendered thus:

Thank you for the world so sweet,
Thank you for the food we eat,
Thank you for the birds that sing,
Thank you, God, for everything.

"For brief, reverent examples, I offer the following well-known graces: 'Bless, O Lord, this food to our use, and us to Thy service,' and 'For these and all His mercies God's holy name be blessed and praised.' Personally, the briefer Latin forms of 'Laus Deo,' 'Benedictus benedicat,' make the stronger appeal, the custom of 'saying grace' being of remote antiquity, and obtaining among the Jews, Greeks and Romans in pre-Christian times."

The second verse given, which is sung to the tune of "Old Hundredth," is a famous old grace, sung in many English orphan asylums and other institutions. While those who are not accustomed to liturgical forms of worship may prefer an extemporaneous grace, we think children gain much by learning these rhythmical blessings, which will remain with them through life, and bring back, in later years, the happiest memories of home and childhood.

The Child and His Belongings.

At a social a short time ago a group of mothers and grandmothers were talking upon the unending yet always interesting and vital subject to them, how to bring up the children? The question before the house was: "How may I teach my child to care for his own things?" Some children have more playthings than they need, perhaps they all do, except those who have none. I notice where there are only a few toys how well those few are cared for. Once, after being at a friend's house, and seeing bushels of playthings scattered about the room, I said if I ever had any children they would have only one toy a day to play with. I must admit I have changed my plans somewhat since my own children came, for then all the aunts and uncles and cousins came, with "gifts and gold," etc. The gold went into the savings bank; I think it nice for every child to have a bank account of his own. What if it is a small beginning? Perhaps the boy on the farm does not have as many pennies as his cousin in town, but he surely has no place to spend them as recklessly, three or five miles from the store. The playthings were loved and played with; each child has a drawer in an old bureau, each one is supposed to keep his own property in his own drawer, and not to touch the other's without his permission. How much trouble could be saved in a family if each member would learn to respect the property of others! "Hands off" would be a good motto.

When I see the children getting careless with a plaything or book, I hide it, then on some (cross) rainy day I bring out those old things and they are new again. In the front hall each child has a hook of his own for his coat and cap, also in the kitchen there are hooks for each, so whichever door they come in the hooks are looking at them. In the kitchen table there is a drawer where we put mittens; if the mittens are dry they are left in the coat pocket, if wet each hangs his own by the stove, unless he wishes to wear them wet the next time. I must confess, though, that I often take them off the stove when they are dry and put them in the mitten drawer. If they are not in their pockets the children go right to that old drawer without asking any questions. H. S.

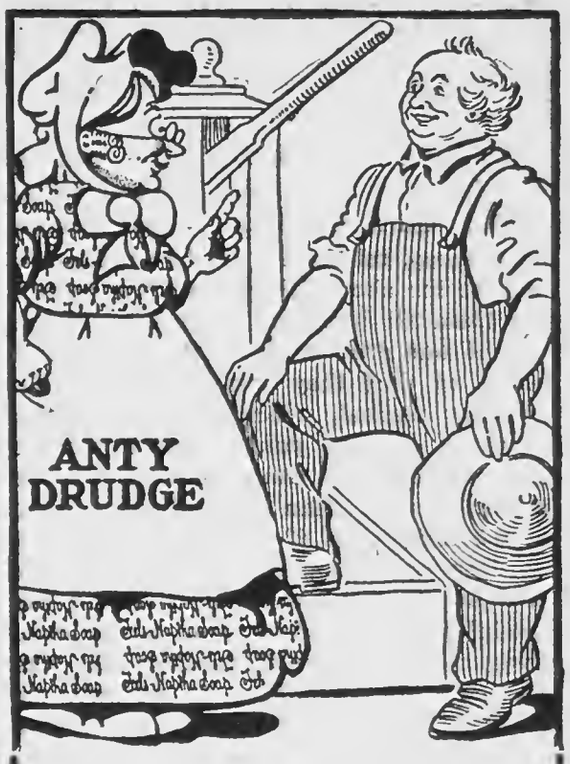
Quilt Patterns

Every quilter should have our book of 450 designs, containing the prettiest, queerest, scarcest, most grotesque patterns, from old log cabin to stars and puzzle designs; also crazy stitches and Cat. All postpaid for 12c, or three complete sets for 30c.

LADIES' ART CO., Block 37, St. Louis, Mo.



Farmer Kindleigh: "Well, Anty, you happened along just in time. The R. F. D. man's been here. He left a carton of Fels-Naptha Soap I bought for Sarah. Heard you telling about it and I ordered some for her. But, as usual, she's not pleased, though—says easy ways can't be good ways."

Anty Drudge: "She a foolish woman! Fels-Naptha Soap is the best friend a woman ever had—does better work, even if it is easy to use, and does it in half the time, too."

Fels-Naptha Soap is the easy-way, cool-water soap. It does everything better than it was ever done before and makes washing, housecleaning, scrubbing and scouring easy.

With Fels-Naptha you don't need a hot fire nor a washboiler for your clothes. You don't have to scrub hard. It dissolves grease and makes dirt disappear.

By following the directions on the red and green wrapper you will find Fels-Naptha the best friend you ever had.

Better buy it by the box or carton.

Fels & Co., Philadelphia.

Live Stock and Dairy

BUILDING UP A NEIGHBORHOOD INDUSTRY.

We have been always fairly successful in our neighborhood in growing lambs. Quite a number of our farmers keep sheep, selling the lambs on the late market for about $5 apiece after pasturing them all Summer. A few years ago one of our growers had his lambs come early, so that they were ready for the January market, which requires a lamb weighing only 40 pounds and brings $8 after eight weeks from birth. That was rather better than the Spring lamb proposition, even if it did require loss of sleep and heavy grain feeding in the Winter. Two or three more found the specialty a profitable one to go into. Every once in awhile another one was added to the number of growers, or dropped out for the reason the lambs did not always come when wanted, or they found their accommodations insufficient. The Washington market was always good, the main trouble being to get the lambs early enough.

A couple of years ago the lambs on one farm where Dorsets were kept were all dropped in November, the ewes having fattened largely on Fall pasturage. When the lambs were born, the ewes were in prime condition, requiring little grain feeding to bring the lambs to market size. The price received for 17 lambs was $187, or $11 apiece without the heavy expense of Winter grain feeding. The worry of caring for the lambs in cold weather was got rid of; all the ewes had to be fed was roughage to keep them in shape; everything was lovely. It looked like a gold mine.

A TROTTER IN WOOL.

The next year the lambs never came until the usual time, the last of December and into January, so it was a taste of chance, not a steady thing. I concluded that if it could be done once, it might be done again if we could get the right conditions. I began to inquire about sheep everywhere I went, or whenever I met anyone likely to know. At last I heard of a neighborhood just over into Chester County where they raised lambs for the Christmas market. That sounded like business. By and by I found time to take a little trip up there and visit friends. I had struck the right place. There were several farms that were growing Christmas lambs. At that time, the last of November, they were bringing $10 apiece alive. The ewes had been off the pasture only a little while. The grain feeding was not heavy, and would soon be done. How did they manage it? That I am not prepared to say. There were a number of things the growers did. Any one of them might have been the cause of their success. Until I can work some of them out in my own locality, the money the earlier lambs may bring is locked up as tight as ever. What I did find quite as interesting was how this industry had been worked up in the West Grove neighborhood.

My first visit was to the farm of Henry Palmer, who grew the first Winter lambs in his neighborhood, and found a market for them. He was typical of the progressive farmer of any generation. When he saw an opening, he followed it up. When he had a bunch of his lambs come early one year, instead of settling down to feed them all Winter and through the Summer, he began to study up what other people did when lambs came early. The result was that he went off to Philadelphia to hunt up a hotel trade for out-of-season lamb meat. He found it. The hardest condition to meet was keeping up a constant supply. When his own few lambs were sold he had no more in view. Anyway he went ahead.

Finally he had to tell his hotel buyer that he was sold out. That is where more than one new promising business stops. Too often the farmer has extra good stuff by snatches, but either hasn't the energy or the knowledge to follow his success up and make it lasting. When he was shipping his last lamb an order came from his buyer asking him to try to get more at any price, and to arrange to send him more than one or two at a time. So Henry Palmer started into the lamb business in earnest. He scoured the country for early lambs, getting one here and another there, often miles apart. Another year he had introduced more Dorset blood into his flock and had persuaded two or three of his neighbors to give a good deal of their time to helping him build up a supply of lambs that would last through the season. Improved methods of feeding and handling that he discovered he shared with them. When he found that a Tunis ram crossed on his Dorset grades consistently gave earlier and better finished lambs, he persuaded them to take up the practice also. He had developed a new industry for the neighborhood. Whether or not they took advantage of the object lesson lay with them.

Well, what happened? Here and there, a farmer more ambitious than the rest or more interested in sheep, joined in. Others were dairying or in some line of business they couldn't or wouldn't get out of, so they benefited only indirectly from the new business. In time Mr. Palmer, growing older, gave up the proposition of handling the neighborhood trade, and now contents himself with his own small flock. What is the status of it now? A few more growers than formerly have taken up the trade. Another farmer who can butcher gives up a large part of his time to handling the trade. He was paying for lambs on foot $10, which he dressed and supplied to the Philadelphia hotel trade. Although this neighborhood has a most prosperous look, and is one over which I could get easily enthusiastic as a livestock country, it has its troubles. Here as elsewhere, some farmers are doing poorly. Here too, we find the old folks with farms on their hands and no one to take their places. New elements are coming in that may or may not suit the [illegible] or two established lines or specialty farming would make a name for the whole countryside. Yet instead of several farmers close together raising Winter lambs and pooling their interests, each goes his own way. One marketer, instead of having all the lambs needed for his trade raised within four or five miles, travels the whole countryside to find lambs enough, and to get growers with enough patience and energy to supply a wonderfully well-paid business.

What is to prevent West Grove neighborhood from being noted as an early

A Family Foundation

Consistent line breeding has developed at Meridale Farms four definite families of strong dairy type and exeeptional producing ability, as is attested by the authentieated reeords of 117 Meridale Jerseys who averaged 7894 lbs. milk, 509 lbs. butter eaeh on yearly test.

One of these families is the Sardas, and one of the best Saydas is Sayda's Queen of Ventnor 168033, who averaged 540 lbs. butter a year for ten consecutive years, and produced 11,433 lbs. milk, 809 lbs. butter when eleven years old. The average authenticated record of herself and two daughters is 740 lbs. butter eaeh per year.

To other dairymen who are working for heavy and persistent produetion we offer a speeial seleetion consisting of two granddaughters of Sayada's Qneen of Ventnor with a son of her full brother, Sayda's Heir 3rd. They are good individuals, backed by produetion through every line, and comprise a family foundation which enables their purchaser to profit by our quarter-century of herd-building experience—he begins where we leave off. Pedigrees and particulars gladly furnished on request.

lamb section of Pennsylvania? What is to prevent my home neighborhood from being an equally famous part of Maryland? Why should we send to New York for our Dorsets, and to Indiana for our Tunis rams? What is to prevent our being noted as breeders as well as growers? Why, between the two neighborhoods we could keep a line of purebred stock that would supply us forever with breeding stock, without any outside help. What's the reason? We have the right conditions. We know how to care for our sheep. We know how to turn out first-class breeding stock. We have the best markets for money sheep anyone could ask for. We haven't got together, that's all. What is more, we do not intend to get together. The opportunity can go hang before we'll give up our own little favorite lines of work or have anybody tell us what to do. Meanwhile we are not keeping our boys with us as we should. Meanwhile another people is coming into possession of our homes and farming lands, first as renters and later to buy from our heirs if not from us. We shall build up neighborhood industries when either we or our children are starved into it! I half wonder if it would not be better to start in now, and hold the land for us and ours by making it the foundation for the biggest success yet. Anyway, let's study over it a bit harder; possibly light will come.

Maryland. R. B.

THE LARGE STOCK FARM.

I note with interest the article of Mr. Phelps on page 139 and also your note in the "Brevities." I received your paper after I returned from a meeting of the Oneida County Farm Improvement Association, where we were addressed by Professors Livermore and Talbum of Cornell. Prof. Livermore gave an address on farms that had been under the supervision of Cornell, some two or three thousand, I believe, and had slips to show us that the farm of 160 to 350 acres or thereabouts were the farms that paid. He also proved that the farmer living on a farm of 30 to 50 acres made barely a hired man's wages. Of course you understand these farms had about the same number of cows, but the large farms could raise a variety of crops, and these offset the poor showing of the cows on the majority of farms. He showed that it took very little more machinery to run a large farm than a small one. He also proved that a large farm got more out of its horses, acres, etc; also that the large farmer had as good a home or better than the small one; better buildings, etc., in the three counties under their observation.

I have had this idea in my mind for a long time, as I have 80 acres now, with a man the year around. I can handle twice as many and crop the land more and buy commercial fertilizer instead of keeping more cows. I think, or rather know, it would pay, else why is it that the large farms always have the cash to buy, and good-looking buildings, etc., and the small ones don't, no matter how hard they work.

Of course I am not counting the apple farms or market gardening farms in on this; but the dairy farms. In the West the farms do not keep a lot of dairy cattle to eat their heads off at the present prices of milk and grain, but raise more cereals, hay, clover, etc., to sell.

The Farm Improvement Association has organized a coöperative association under the laws of New State State, and incorporated for $10,000 to buy grass seeds, clover, lime, phosphate, and also to sell better produce of farmers. It has started at $5 per share, and is trying to scatter the shares as thin as possible over the county, so that all the farmers desire may come in now and benefit themselves later. A. J. LAM.

Oneida Co., N. Y.

"CHILDREN," said the teacher to his pupils, "you should be able to do anything equally well with either hand. With a little practice you will find it just as easy to do anything with one hand as it is with the other." "Is it?" inquired the urchin at the foot of the class. "Let's see you put your left hand in the right-hand pocket of your trousers."—Ladies Home Journal.

Purebred Registered
HOLSTEIN CATTLE

According to figures compiled by the department of animal husbandry of Illinois University, a cow must produce 4,000 pounds of milk and 160 pounds of fat a year to pay for feed and labor. Every 1,000 pounds above this brings a yearly profit of $10. Thus a 5,000 pound cow earns $10 a year, an 8,000 pound cow earns $40, but when production reaches 10,000 pounds the profit is $63.

Systematic investigation confirms the wisdom of those who have taken up the Holstein-Friesian breed.

80 Imported Percheron and Belgian STALLIONS and MARES ON SALE

My exhibit comprises the largest number of big, heavy-boned, 2000 to 2100 lb. Stallions to be found in the United States.

The Cedar Rapids Jack Farm is the Jack Metropolis of the World. All nations buy Jacks here. The majority of the best mules in the United States are the results of the past twenty years' improvement inaugurated and carried on here. Write for catalogs. Come to me when you need stock. I will make it worth your while.—W. L. DeCLOW

Stallion and Jack Importing Farm, Cedar Rapids, Ia.

Meat from Calves.

I have raised two calves for meat in a good deal the same manner as T. L. W., page 157, tells us about. My method is to take a June or July calf (after the prices have lowered on veals) and let it suck the cow till the milk can be saved. This regulates the calf's digestive organs. Then teach it to drink the new milk; decrease this and very gradually add scalded porridge made of middlings or shorts till you get the calf taking a quart of new milk and his porridge thinned with water. Now increase the porridge and give skim-milk. The calf will grow well if you feed only a quart or two of milk. Stake him out where he can get fresh grass every day. Then I gradually add cornmeal cooked thoroughly till I am feeding him a quart of mush thinned with a quart of milk and as much water as he needs to make a good mess; then when frost comes let him eat all the dry meal he will with good hay or fine corn fodder. Make changes gradually, and I will guarantee you will have some of the best meat you ever tasted. I can what we cannot keep fresh, cook it off the bones, press cans full of the hot meat, fill all cavities with the liquid, and seal hot; then can all the juices left for soups. I believe this is the cheapest and best beef a farmer can raise.

MRS. C. R.

Producing Clean Milk.

During the last five years there are few subjects which have demanded more consideration from the general public than that of producing sanitary and healthful milk for the market. When I was a youngster on the old farm, the task of milking was usually allotted to the hired men, but this condition does not exist to-day, and it is a good thing for all concerned. However, there are two reasons for this. In the first place, the hired man who will milk cows is a hard thing to find at present, and in the second place, the consuming public are more particular as to how their milk supply is produced.

While a great many farmers bewail the fact that hired men do not like to milk, I believe that it is the best thing for all concerned that they do dislike this work. In the case of the farmer, if he has to tend to the milking of the cows himself, he will quit his work early enough so that the cows may be milked in time, and he will see that this is done regularly. It stimulates a greater interest in the cattle and more pride in that he knows the purity of the milk supply. The average hired man has seen from experience that milking cows is a job which is usually to be done after regular working hours, and so is not in favor of it. Now under the old system of having hired help milk, I have seen many a man sit down and milk after he had been hauling manure all day without even changing his clothes. I doubt if there is a single reader of THE R. N.-Y. who has not also seen this same thing done. When one stops to think that of all possible substances under the sun, milk is the best feeding and breeding place for over 3,000 forms of bacteria, some of the ordinary ways of milking on the farm are not to be countenanced under any circumstances. There is another thing which comes under the same ban. A short time ago, a dairyman came to see me. He did not get up until I had the milking about done, and when he came out to the barn you should have heard him rave. The fact of the matter was that I had not cleaned the stables, and this man was of the opinion that stables should be cleaned before the milk is drawn. I am not of this opinion. I would far rather drink milk that has been drawn before the stables are cleaned than to drink that which has not been drawn until after the barn is cleaned. When the manure is thrown out, the stable looks clean, but it is not; that is so far as the air is concerned. The facts of the matter are that all sorts of bacteria and germs on the straw and litter are put in circulation and they are ready to get into the milk and cause objectionable growths. It is best to stir up as little dust as possible until after milking is done.

I remember once at home I was "dumping" around behind the stove in the Winter. I had been sick, and when it got to be about the usual milking time, my father asked me if I thought I would be able to milk that night. I thought I would. My father did not think what he was doing, but this shows the proper growth of this question from that day to this. Nowadays, we would not think of asking a sick man to milk. We think that only the most healthy of men are fitted for this important work. When a person is coming down with a disease, or when he is convalescing, the milking stool is not a fit object upon which to sit; neither is a pail of milk a fit object for him to be breathing across. The importance of this subject is growing daily, and the wise farmer will keep this part of his farming operations above reproach —this for the good of his family and society.

I. J. M.

Ingham County, Michigan.

Crumbly Butter.

What makes butter crumbly? I feed the cow one pound cottonseed meal, one pound cornmeal, one-half pound wheat, ground, one bushel corn silage to one feeding. For roughage I give clover hay and cornstalks.

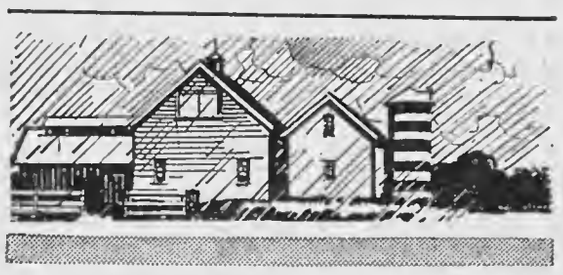
M. B.

Michigan.

The crumbly condition is caused by working the butter when too cold. If worked as soon as possible after churning the butter will generally be warm enough to work nicely, after washing with cold water. If worked too warm a salvy, sticky texture will be produced, so one must guard against this extreme also.

C. L. M.

Two old colored women were having dinner together in the cabin. The pot of boiled cabbage was on the floor and the dog walked into the room and started to drink out of it. Old Aunt Easter drove him out with the broom, and coming back she gave the other old woman a spoon. "'Liza," she said, "take dis spoon and dip dem dog-laps out o' de cabbage!"—Credit Lost.



Letting in Weather
Lets out Barn Values

To cut down the paint bill at the barn's expense is sure to cost big in repairs, depreciation and *extra* paint bills.

Dutch Boy White Lead

and Dutch Boy Linseed Oil is the standard, old-fashioned wearing paint that is elastic, penetrating, waterproof. Your painter will mix it, or you can. It can be tinted any color. It grips the surface like a nail.

You can now get red lead in paste form, same as white lead. Doesn't harden in the can. Fine for painting resinous wood; best by all odds for implements and metal work. Ask your dealer.

A Text Book on Painting, FREE

Tells how to mix any colors, how to estimate the cost of a job; how to choose colors; how to test paint for purity. Ask for Farmers' Paint Helps No. 252.

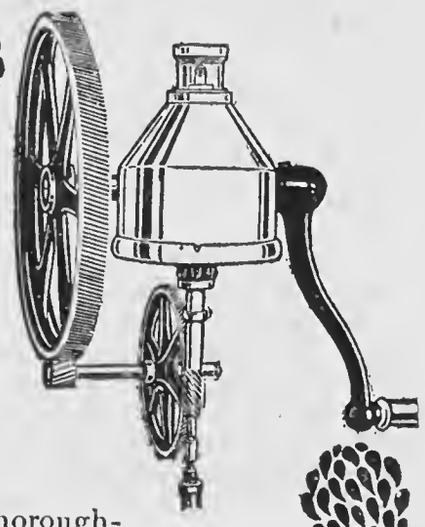
The Simplest CREAM SEPARATOR Ever Built —

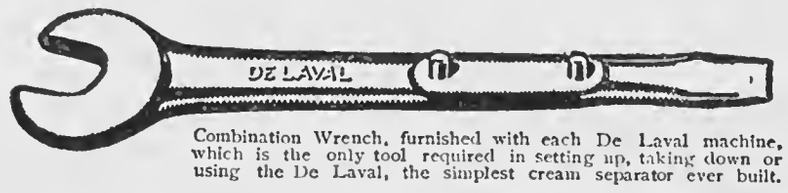
DE LAVAL



EXCELS ALL OTHERS not only in thoroughness of separation, sanitary cleanliness, ease of running and durability, but as well in its great simplicity.

THERE IS NOTHING ABOUT THE OPERATION, cleaning, adjustment or repair of a modern De Laval which requires expert knowledge or special tools.

NOR ARE THERE ANY PARTS WHICH REQUIRE frequent adjustment in order to maintain good running or to conform to varying conditions in the every day use of a cream separator.



Combination Wrench, furnished with each De Laval machine, which is the only tool required in setting up, taking down or using the De Laval, the simplest cream separator ever built.

THERE IS NOTHING ABOUT THE MACHINE THAT cannot be taken apart, removed or replaced by any one who can use a wrench or screw driver. In fact, the only tool which is needed in the use or the operation of a De Laval Cream Separator is the combination wrench and screw driver illustrated above, which is furnished free with every machine.

ACME Pulverizing Harrow

Makes the Seed Bed Perfect

It puts the soil in best condition to conserve the moisture for plant life. The sharp sloping knives work under to the plowed depth, pulverizing the entire bed; they crush the lumps and leave a fine surface mulch, embedding the plowed under manure in finely pulverized and compacted soil. This makes better yields, the plant roots finding nourishment easier.

The ACME Pulverizing Harrow is the only implement needed after your plow to prepare perfect seed beds. It is light in draft and low priced. Ask your John Deere dealer about it and write us for literature.

PRODUCTS, PRICES AND TRADE.

The cut in milk prices to the producer has been more general—$1.81 for B, covering a large amount of business, and 10 cents less for C grade. This means 3¾ and 3½ to shippers who get the full price.

*

Egg prices are practically the same as last week, though nearer a decline, judging from the general tone of trade. Receipts have been heavier than were expected. Some fancy white eggs wholesale at 38 cents, but they must be large to do this; 35 is nearer the limit for most shipments, and 30 for brown.

*

The better grades of butter advanced two cents during the week. Business in medium and low quality is very dull. The dairy butter now arriving is showing a poor average quality, considerable going at 20 to 21 cents, while packing stock runs as low as 16. The best storage creamery brings 27, and best fresh 28½.

*

There were launched during 1913, 1,881 merchant vessels, with 2,651,000 tonnage, a net increased of 800,000 over previous years.

*

Norway ships large quantities of salt mackerel to this country, last year's output being 41,700 barrels, worth approximately $500,000.

*

Argentina is sending from 10,000 to 25,000 quarters of beef to the United States weekly, in addition to an average of 10,000 carcasses of mutton.

*

Textile mills at Fall River, Mass., capitalized at $30,600,000, and operating 3,200,000 spindles, show a net surplus for the year of $586,377. Of these 38 corporations, the stock has sold recently at from 100 to 175, the remainder running from 60 to par.

*

St. John, New Brunswick, has a large shipping business, and the Dominion Government is to spend $3,000,000 in dock and harbor improvements. This will use 14,500,000 feet of timber, in addition to concrete for surface of the wharves. The sub-structure of the wharves must be very deep, as they must extend 30 feet below low water and provide for a tide rise of at least 20 feet.

*

The wool market in the East continues very firm, with prices tending upward. Manufacturers are showing a decided interest especially in medium and fine domestic wools. Recent reported prices are: Ohio half blood combings, 23½ to 24; quarter blood, 22½ to 23; XX, 26 to 27. Canada's first large shipment of free wool (50,000 pounds) passed through the port of Ogdensburg, N. Y., February 6, bound for New York.

*

The practice of branding Ben Davis apples "Red Roman" or some other name than the right one appears to be increasing in the East, and with the sanction of experienced and reputable fruit growers. The excuse given is that the variety has been criticised so much that the apples will not sell for what they are worth unless labelled differently. This may be true in a small minority of cases, but they are exceptions. The rule is that the man who buys Ben Davis knows what it is as soon as he sees it and pays as much for it under one name as another. An attempt to dispose of it under a false name is sure to result in dissatisfaction to the buyer, and is really an injury to the business, although it may not appear so to those who see only part of the transaction. The Ben Davis is in a class by itself, profitable for late keeping and long distance shipment, fairly good when properly baked, but never a dessert variety, no matter what fancy name is hitched to it. W. W. H.

Western Reserve Holstein Breeders met February 2, 1914, at the pleasant home of E. L. Taylor and wife of Burton. The following officers were elected for the year: President, C. H. Ford, Burton, O.; first vice-president, L. G. Richards, Burton; second vice-president, George Hodges, Newbury; third vice-president, Howard Newcomb, Burton; fourth vice-president, N. E. Shanower, Burton; secretary, B. J. Shanower, Burton; corresponding secretary, Rev. George E. Merrill, Burton; treasurer, E. L. Taylor. Two new directors were elected, A. S. Boswell, Russell, and C. F. Harrison, Middlefield. Date of meeting, which has been first Monday of every other month, was changed to the first Friday, which would be more convenient for the ladies, who contribute no little enthusiasm to these helpful meetings. Then followed a talk on Holsteins, which would cause even the sheep man to want to own one of the black and white beauties that have placed Geauga County in the eyes of the world, owning as they do four out of six of the world's greatest cows, besides scores of fine cattle whtich find ready sale at owner's door.

MRS. JAMES LAMPMAN.

IMMIGRANT LABOR BUREAU.

This bureau, maintained by the German Society of the City of New York, and the Irish Emigrant Society, is a free market for immigrant labor open to all employers throughout the United States. Its headquarters have recently been moved from Pier 1, North River, to 15 Pearl street. Supt. W. W. Meara makes the following statement about the bureau's work:

1. While maintained by the societies named above, immigrants of all nationalities are equally privileged in the bureau; and due attention is given to an employer's preference in this respect.

2. This office charges no fees or commission of any sort to employer or immigrant.

3. Land speculators are excluded from the privilege of the bureau and all propositions looking to the sale or leasing of land to immigrants will be rejected.

4. Employers applying at this office must furnish satisfactory references. Agents must be duly authorized by their principals and be well recommended.

5. This office does not make contracts for immigrants with the employer; it does not fix the amount of wages nor the time of service, nor prescribe any other condition of the contract; it leaves all these matters to be settled by the voluntary agreement of the parties immediately interested, and asists them only by giving needful information and advice.

6. Employers must in all cases provide for the transportation of the employee to their respective places of destination.

If the means sufficient to pay travelling expenses are remitted to this office with the request to send hired help to the applicant, we shall see that the employee is properly started on his journey.

Due diligence will be used to execute such requests; but employers are made aware that delay may unavoidably occur—either through increased demand advancing wages beyond rate fixed by employer—the falling of supply—or difficulty of securing suitable persons with sufficient baggage to protect the employer against loss of travelling expenses.

In such application employers should state distinctly the description of labor required, the nationality preferred and the rate of wages proposed.

Remittance to this office should be made in national currency, Post Office order or checks on a New York city bank.

7. To secure the arrival of employees, we shall, where it is possible, have their baggage checked through to destination, and the checks sent by mail or express to the employer. When through checking of the baggage is not feasible it will be forwarded by express.

Pulping Beets for Hens.

I believe that poultry would eat more green feed in the form of mangel wurzel beets, if the beets were grated and fed to them in stone crocks, and with a desire to do this, I have been looking for information in the farm and poultry papers for some machine suitable for grating up beets, turnips, and other such vegetables for poultry feed. The only ones I have seen cut the vegetables in too large pieces. It seems to me they should be grated up about as fine as the dry beet pulp comes. Do you know whether any such machine is made? If so, I should be glad to learn of it. F. M. P.

Connecticut.

R. N.-Y.—Who can tell us where to find a "beet pulper" such as are made in Europe?

"Right there is the Spreader YOU want"

That's the quick answer every well-posted farmer gives to the man who inquires about "The Best Spreader Money Can Buy." Fifteen years ago we started building spreaders with a "New Idea" backed up by high ideals. We wanted more than a mere "manure dumper." Direct drive, easily adjusted feed, thorough pulverizing, wide and even spreading—those were some of the things we demanded of our machines, all of which we made come true in "New Idea" Spreaders. We now go a step further. *All* the good features that made "New Idea" Spreaders famous are retained and a few improvements are worked out which can be *Found Only* in the

NISCO WIDE SPREAD LOW DOWN SPREADER

Points of Superiority

"Nisco" Spreaders have a practical low-down top with sides only 41 inches from ground. There is 17½ inches clearance under bed, hence conveyor cannot drag over ground. The main side sills are heavy channel steel, bolted to sides and cross-pieces. Inside measurements of bed are 18½ inches deep—from three to five inches deeper than any other so-called "low-down" spreaders. *"Nisco"* Spreaders are built along simple and substantial lines. All parts subject to heavy strain are of steel or malleable iron. Of course it has *all* the really unique features of the "New Idea" Spreader, such as special, patented distributors, double cylinders, etc., etc.

Free Circular Shows

"Nisco" Spreaders just as they are—in full colors. There are two score reasons why the *"Nisco"* is the spreader for the man who values spreader perfection. Please give the circular a chance to tell you more about *"Nisco"* superiority. Write for it and for fully illustrated catalog which tells all about our machines, often termed "The Best Spreaders On Wheels."—both *FREE*.

In spring, summer, fall or winter—against ice, snow or rain; nesting birds or trash—you can always depend upon the

Louden Bird-Proof Barn Door Hanger

Roller bearing trolleys are completely enclosed in heavy steel tube. Cannot be clogged or derailed.

Trolleys operate on level tread, reducing friction to the minimum and preventing wedging or binding. Light and heavy doors roll with equal ease when fitted with the Bird Proof.

Double flexibility permits the door to fit snugly without sticking or binding, and lessens the probability of its being broken by crowding stock.

The tubular form of the Bird Proof Track, and the special grade of steel used in its manufacture, combine to give it wonderful strength and rigidity. Will not sag with heavy doors.

BUILT FOR DURABILITY AND SERVICE

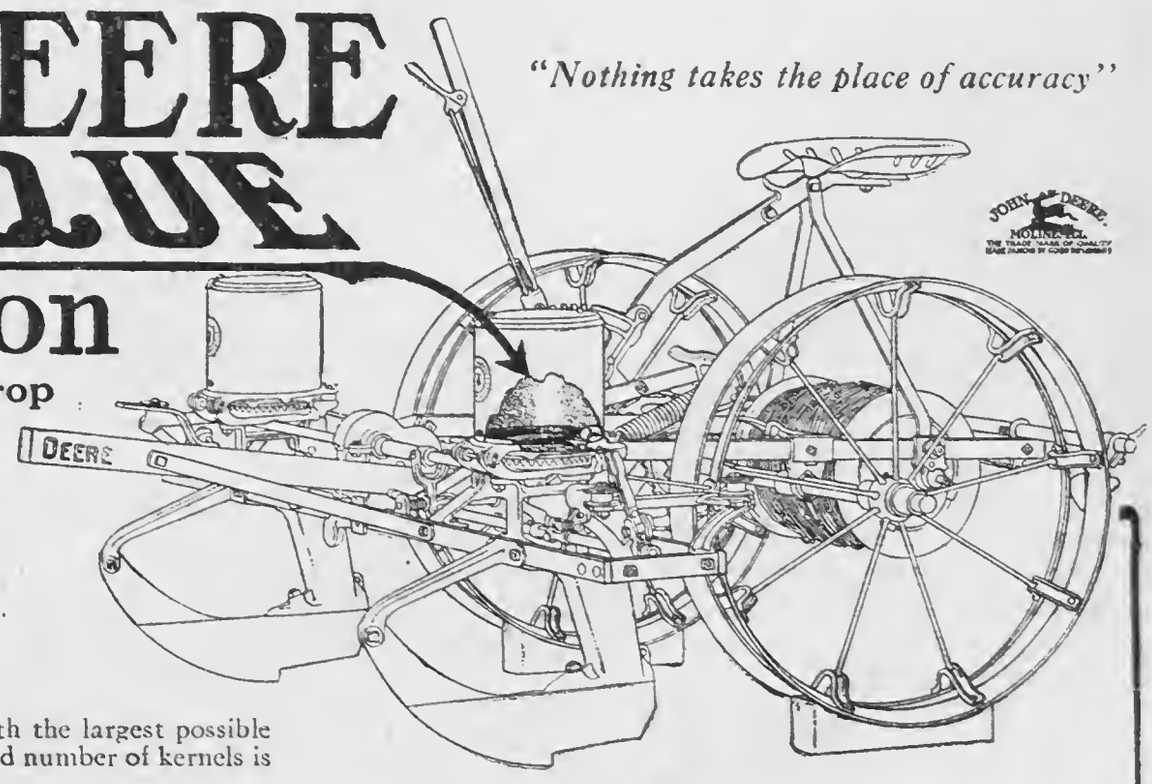
JOHN DEERE OBLIQUE Selection

"Nothing takes the place of accuracy"

The "Natural" drop



This machine maintains high accuracy even with ordinary seed. With well selected seed its dropping accuracy is practically perfect.

Make your corn ground pay you with the largest possible yield, by making sure that the required number of kernels is in each hill.

The seed must be there. Every "miss" means just that much thinner stand. No amount of cultivation can make up for inaccurate planting. The loss of one ear from every hundred hills costs you the price of one bushel per acre.

For years the John Deere Company has concentrated on accuracy in planting devices. The "Oblique Selection" solves the problem.

The results of its use are so profitable that many corn growers have discarded the best of previous machines. It is as far ahead of the old Edge Drop as it was ahead of the round hole plate

Make your spring planting the start of your biggest corn crop by accurate dropping. The John Deere "Oblique Selection" will do it. The machine is a splendid investment.

Free Book Gives Valuable Corn Facts

Write us today for free booklet "More and Better Corn". It tells you why the average yield for the United States is only 25 bushels an acre, whereas better methods have produced 125, 175 and even 255 bushels per acre in places. It also describes and illustrates the John Deere 'Oblique Selection" Corn Planter. The book to ask for is No. D 33.

An Experience With Vetch.

We have been growing vetches for a number of years, and find it pays to grow our protein instead of buying it all. In 1911 we sowed about six pounds of seed on six acres with clover to support it. We started to cut it June 25, and I pulled up one single root that weighed seven pounds green and it shrunk 75% in drying. It set me to thinking about what one such root would make if it were possible to grow one to the square foot on an acre. There are 43,560 square feet in an acre, and my theory is this seeding of vetch and letting it grow big, gives 21 3-25 tons to the acre. Then I counted the seed to the pound and found 11,800, 3.9 pound to acre, but we generally get on 10 or 15 pounds to the acre. The fourth of last July we had one single root that grew on light sandy soil and weighed five pounds green; the roots were so strong and deep that it broke off at the top of the ground. I took it down to the State Fair and it was exhibited. I went to Chicago to help them demonstrate the value of sowing vetches in corn, as we also sowed it in our corn the last cultivation for humus to plow down, and had a fair stand on the low ground, because of the drought.

The Delaware Experiment Station advocated using $6 worth of seed per acre, and they considered they got $15 to $20 worth green stuff for pasture on humus. I would not advocate more than 15 to 20 pounds to the acre in corn. Frosts do not affect it, and it grows till cold weather for those who plow their corn ground in the Fall. Spring vetch is the same value and costs about one-half the price of Winter vetch and Winter vetch about one-half the price of Alfalfa, usually.

Prof. P. G. Holden of Chicago, advocates Alfalfa on every farm, but for those who cannot make a success of Alfalfa I am confident that having abundance of vetch on the farm will help to double the value of the tillable land every 10 years, as I know they gather so much nitrogen from the air and store it in the soil.

LYMAN CRANE.

St. Lawrence Co., N. Y.

Nitrate on Rye Cover Crop.

Through carelessness my Florida rock was not turned under with clover last Summer. I have now planted rye thick; can I use the rock with it instead, as I am anxious to get it in the soil at once? Some of the rye is to grow tall; how can I apply the rock to it in order to plow under? Is this practicable for three different fields, the object being to improve the soil: 1. Turn rye under late, having top-dressed with nitrate of soda, harrow in lime and seed to Crimson clover July 20. 2. Top-dress rye with nitrate of soda, turn under when young, harrow in muriate of potash, plant corn May 10-20, after harvesting plow at once for wheat, harrow in lime and plant wheat September 20. 3. Top-dress rye with nitrate of soda, turn under young, harrow in muriate of potash, plant corn followed by rye in October. F. K.

Philadelphia, Pa.

We are not strong advocates of raw phosphate rock alone on our Eastern soils. With us the available phosphate has given better results. If, however, you intend to use the raw phosphate and have not turned it in with clover, we see no reason why you should not spread it on the young rye, say in April, or before the rye makes much growth. Then plow the rye under when you are ready, and fit the field as well as you can. We should not consider it good practice to use too much nitrate of soda this Spring, if the rye is to be turned under for Crimson clover. We doubt if the nitrate will give additional growth enough for a green manure crop to pay. We should spread the phosphate as suggested, plow under the rye, and use half a ton at least of air-slaked lime. Then fit the ground properly, keep it worked up, and sow your Crimson clover in July, making an application of potash at that time. For the second field, which is for corn, we would not use the nitrate of soda, but would plow under the rye and lime as before suggested; fit the land properly, and plant corn, using either a standard corn fertilizer, or a mixture of tankage, acid phosphate, and muriate of potash in the hill. We think the lime directly after plowing under the rye would be more effective than later on the wheat. For the third field we should also avoid the use of nitrate of soda, add the lime, and handle the corn as above.

The Rural Carrier's Side.

I was much interested in the complaint printed on page 151 by "A Reader" who resides at a remote distance from the line of travel of the rural delivery route, and must travel over a mile back and forth each day to obtain his mail. I am a rural carrier, have been one for 11 years, and to compare his ease, with others of the same nature, on different routes in this country, it would seem that "A Reader" is far more fortunate than a great many farmers whose residences are not on the public road traveled by the carrier.

Take my route for comparison, which is 25 miles in length, and serves 138 families. I can count 36 of them living from one-half to four miles from the line of travel by the carrier. In order to serve those 36 families at their residences, it would be necessary to drive about 45 miles in addition to the regular route, making a total distance of 70 miles. "A Reader" can console himself with the fact that he is not the only victim of such circumstances. The chances are that he had to drive four or five times farther before the route was in operation, and was perfectly satisfied to do so, but now that the Post Office Department has granted him rural delivery he wants the carrier to drive two miles so he can have his mail delivered at the door. "A Reader" should keep in mind that there may be other patrons on the route whose farms are situated off the main road, and also, that the Post Office Department could not give him such service as he desires, without giving it to his neighbor. The department tries to get as close to the door of the farmer as possible, but to deliver at each residence on every route in operation at the present time would require the employing of more than 50,000 rural carriers in addition to the 43,000 who are now serving the American farmers with daily mail.

You advise him to apply to the postmaster, and if he refuses apply to Washington, but the postmaster usually decides it. This last paragraph will no doubt lead many patrons of rural routes to believe that their postmaster has the authority to say where the carrier must or must not drive, but from my experience in the service, I am sure that the postmaster has far less to say than the patron himself. In fact, I believe there are very few postmasters who are qualified to pass on such an important matter as the length of a rural route, not having had experience in that line. If they did have such power it would be unnecessary for the Post Office Department to employ the hundreds of competent, and well-paid rural route inspectors for that purpose. Doubtless, if the postmasters had such authority some carriers would be driving 40 or 50 miles, while his brother carrier in the adjoining town would be driving 15 or 20 miles. It is more than likely that the carrier who serves "A Reader" is driving a standard route, possibly much more, and to compel him to drive one mile and return to his residence would be adding over 600 miles to his annual drive, without any compensation for such service. I do not wish to say that I am opposed to delivering mail to farmers residing at remote distances frome rural routes; on the contrary I regret that such service is not practical, because I believe he is entitled to the same service as his city brother. In the meantime the farmer can do much toward getting prompt and more efficient service from the carrier, by turning his attention to the building of better roads, and keeping them in good condition, also by seeing that his mail box is located at a convenient point, at a uniform height, and securely fastened to the post. There are a great many things that a farmer can do to induce the Post Office Department to come closer to the one residing at a remote distance from the lines of rural routes, the most important of which is the building of good roads. J. M.

New York.

Care of Geese.

I am interested in geese but so far have only one flock of four Toulouse. I wished to make this a good paying side line on my farm by adding 20 or 30 more breeders, but have been cautioned that I must have separate runs for each family and that they cannot be adjacent to each other; and that these runs must have running water through them. I have heard of people keeping 40 to 50 breeders, and I suppose they could be allowed to mate up while in one flock. G. J. S.

Canada.

Geese do not need running water, although they always enjoy it. A swimming pool is perhaps a help during the breeding season, but is not an absolute necessity. They should always have an abundance of drinking water. Most of them would probably mate if all ran together in one flock, but if you had any choice you should separate intended pairs or trios from the others in the Fall, and keep them by themselves till Spring. Even then a few individuals might take a notion to select their own mates. Geese cannot be profitably kept in small pens, or runs, like ducks. They need a larger range, and can get most of their living during the Summer from grass. If you have not had much experience with geese my advice would be to increase your flock slowly. W. H. HUSE.

More Hay per Acre

The acreage and price of hay are increasing, but the yield per acre, only about one and a quarter tons, is too small to be very profitable.

But with yields of 3 to 4 tons per acre the profits are much better. Such yields can be secured by top dressing with

POTASH

nitrogen and phosphoric acid in the right proportions.

The usual type of grain fertilizer is quite unsuitable for hay.

The *Rhode Island Experiment Station* has conducted investigations for many years on the top dressing of hay and proves that it is possible and profitable to produce large yields of hay year after year by the use of commercial fertilizers only.

The Station recommends (Bulletin No. 90) the annual application of

400 lbs. acid phosphate
200 to 250 lbs. muriate of potash
350 lbs. nitrate of soda

per acre, and if the land be acid (sour) it should receive a ton to a ton and one-half of air-slaked lime before seeding.

Under this treatment poor hay lands were made to yield over 4 tons per acre and to give a very handsome profit over the cost of the fertilizer. The quality of the hay was also greatly improved.

Potash Pays on hay. We sell potash in any amount from one 200-lb. bag up.

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates

Dairy Ration.

With the price on gluten $1.55; cottonseed meal $1.75, oil meal $1.80, wheat bran $1.35, cornmeal $1.50, give me the best and cheapest ration for cows in milk. For the past 10 days I used gluten 100 pounds, cottonseed meal 100, oil meal 10, and mixed it and fed from four to five quarts per cow, but I would like to know if that is a good feed. If not let me know. C. H.

Callicoon, N. Y.

This is a good ration as it stands, but would be a little better if you will add 50 pounds of bran. The ingredients you are using are very heavy, and if something light and bulky be added, like wheat bran, digestion and assimilation will be better. C. L. M.

Improving a Ration.

Will you advise me in regard to a balanced ration for cows? I have plenty of cob meal available, and am feeding four quarts of cob meal, one of cotton-seed a day. Could you make me a better balanced ration with cob meal in it? I have oat fodder, millet and plenty of good hay. H. P. B.

Barkhamsted, Conn.

I believe the following mixture will give slightly better results than the one you are using: Corn and cob meal, three pounds; cottonseed meal, two pounds; wheat bran, one pound; oil meal, one pound. C. L. M.

Succulence Needed.

Our heifer was two years old last month, and had her first calf at the same time. We are not going to raise the calf, and weaned it when about 10 days old, so that the loss of milk is now becoming more apparent every day, cannot be attributed to the calf. We feed about a half peck of feed and bran at a meal, also cut cornstalks and Timothy hay plentifully, but the milk supply is steadily diminishing and I am anxious to find out the reason. Would you approve of gluten meal and oil meal with the bran and if so, what is the proportion or what ration would you recommend to improve the milk supply? G. B. D.

Dunellen, N. J.

Your heifer is showing the effects of Winter conditions and a lack of succulent feed. If you could procure a good supply of silage, mangels or dried beet pulp you would prevent further shrinkage in milk from this cause, and your heifer would keep in better condition physically. If you cannot get any of the above mentioned succulent feeds you should feed at least three pounds of gluten or 2½ pounds of cottonseed meal and one pound of oil meal per day. The proportion of bran to these feeds would be about twice as much bran by weight. Timothy hay and cornstalks will dry cows up very fast, as a rule, unless special pains is taken to keep up the flow of milk with other feed. C. S. G.

Read the Feed Analysis.

The other day when I drove up to the station with a load of produce a farmer whom I knew stepped up to me, showing a sample of bran from a carload he and his neighbor farmer had bought from a dealer in Buffalo, and which they were just unloading. The sample appeared to be a fair grade of bran, and as it was $1.80 per ton cheaper than at my dealer's, I decided to take a load. I happened to meet my feed dealer and incidentally told him of my intention of loading from the car. He warned me by asking if I had seen the analysis. I told him I had not, but had seen the bran. He laughed and we parted.

When I drove up to the car the sacks were toppled into the sleigh loose and I occasionally noticed the print on them read "Blue Grass Feed," etc. I reckoned they were perhaps a lot of old mixed sacks, and relying on the integrity of the farmers handling the feed and thinking it was rather difficult to get a reliable analysis from the sacks I finished my load and drove away. On arriving home and unloading I found them to be all new sacks printed: "100 lbs. Blue Grass Feed. Guaranteed analysis: Protein 9-11; fat 2-3; fibre 16-17." This appeared to me as if I was stung, but when I compared the analysis with that of my $28 bran, I knew I was. Following is the analysis of the better bran, so one can draw his own conclusions: Protein 15.50; fat 4.50; fibre 8.50; carbohydrates, sugar and starch 33.00. What I wish to impress your readers with is that you cannot judge a feed from its appearance, and while I tasted and chewed this bran I could not distinguish, till I chewed the better bran, when the woodiness of the former became apparent. F. W. K.

Wyoming Co., N. Y.

R. N.-Y.—Yes, and be sure to read *all* the analysis. You may find this "including mill run of screenings" which means that sweepings, screenings and weed seeds may have been run into the bran.

Results of Balanced Ration.

I was called upon to attend to the feeding of six cows for a farmer during a part of the Winter season. The cows were going dry, the best one giving only about 12 pound a day, though they should have been giving good messes. They were fed silage and hay in reasonable proportions but their grain ration was completely out of balance. It consisted of bran, cornmeal and hominy, and was fed by measure regardless of weight, though the full weight was sufficient, but lacking in protein content. When that grain was gone, I replaced it with linseed meal (old process), cornmeal and cottonseed meal. I should have used gluten instead of cornmeal but it was not in stock. I proportioned these feeds to form a balanced ration and fed the same amount by weight which the farmer had fed. Each of those six cows doubled her milk production in a few days and the expense of the feed was actually lessened.

New York. C. M.

Another Dairy Ration.

What do you consider a good, not too expensive grain ration for two cows? We have plenty of good quality meadow hay mixture of Blue grass, Herd's grass and common bunch grass. Prices are: Bran, $1.45 per bag; middlings, $1.65; gluten, $1.75; linseed, three cents per pound about. We have no silage, corn fodder or oats of any kind. Cows are Holstein, heifer and Holstein Jersey five years old, kept for home use, latter due to freshen next June. A. L. S.

Candia, N. H.

Mix two parts by weight of gluten, one of bran and one of middlings. If the middlings are the brown sort so common on the market, and really only finely ground bran, use cornmeal instead of middlings. Of this grain mixture feed one pound per each 3½ pounds of milk produced. Give a little more to the cow due to freshen in June until April 1 to 15, when she should be dried off. When dry feed her two to four pounds daily, or enough so that she will be in smooth condition when she freshens. Feed hay two or three times daily, all the cows will eat up clean. Do not feed cornmeal for three or four weeks before the cow freshens. C. L. M.

NATIONAL FIRE PROOFING COMPANY, Syracuse, N. Y.

Fills Your Silo Quickly With Less Power and Labor
You can operate this machine with a 4 h. p. gasoline engine. It's the lightest running blower type of ensilage cutter made—The *throwing, blowing, lifting force* carries the ensilage in a steady full stream rapidly up into the highest silo without waste of power. The ensilage packs perfectly and keeps sweet and succulent. The
PAPEC ENSILAGE CUTTER
is easy to set up and take down. Simple in construction, not easy to get out of order. The entire frame is one solid piece of semi-steel. The bearings are always in line, run smoothly and will not heat. The feeding mechanism is geared to the main shaft—always gives you the desired length of cut. The *Papec Ensilage Cutter* is not chain driven, but has heavy gears which transmit *all* the power. It cuts ensilage perfectly and swiftly—as fast as you can bring the corn to the machine.
Write for Illustrated Catalog. Send today for this book. It shows how The "Wonderful Papec" cuts ensilage with less power, time and labor.

THE NEW YORK STATE BREEDERS' ASSOCIATION.

PART I.

In opening the convention of the association President Calvin J. Huson, State Commisioner of Agriculture, pointed out the need of plans for promoting the live stock industry of this State, and gave figures from census reports showing the decadence in some branches of live stock growing, and unsatisfactory increase in others. In the 20 years previous to 1910, dairy cows have increased in number in this State by 69,000, with a still greater proportionate increase in valuation. Swine have barely held their own in numbers, while sheep have fallen off 50 per cent. in numbers and value during the last census period. Horses, also, have shown a consistent decrease since 1890, losing 36,000 in the first 10-year period, and 37,000 in the next, though their valuation has increased by $32,000 in the last 10 years. Census figures show that to each farm in the State there are seven dairy cows, three pigs, four sheep and 2½ horses, including colts. The West and Northwest are now making heavy drains upon New York's supply of dairy cows, and the demand thus created adds to the profit of producing those of the right type. According to Commissioner Huson, New York does not produce enough pork in one year to feed its people one month. The rapid decrease in the number of sheep kept calls for legislation against one of the chief causes of this condition, the ravages of dogs, and further legislation is needed in the matter of State regulation of horse breeding. Only one in seven of the stallions registered in the State are purebred, and while the owners of the present generation of stallions should be protected, scrubs should be gradually eliminated.

Following President Huson, H. H. Wing, Professor of Animal Husbandry at the State College of Agriculture, Ithaca, N. Y., discussed "The Present and Prospective Status of the Purebred." The breeding of pedigreed animals was shown to be a very modern industry, its history extending over only about 75 years. Purebreds do not now exceed two to five per cent. of the total animal population of this country, and the present generation, at least, need have no fear of glutting the market by over production of this class of animals. The public is just beginning to appreciate the value of purebred stock, and the market for this has never been better than during the last 10 years. Grades are not to be condemned, many having been developed to rival in production and efficiency the purebred; some, even, have shown ability to transmit their desirable characteristics, but the aristocracy of the herd book is an exclusive one into which a grade may never break, and while a grade may equal a purebred in productive value, it can never possess the country-wide market open to the latter animal. The value of purebreds will be measured, in the future, by their efficiency in doing the work required of them, and this efficiency will be the means of determining the progress of the breed. If it is worth while to breed any animal, it is only worth while to breed within herd book registration; and all should do this. If, in the course of time, all animals should become purebred, they would still divide into classes based upon merit, and thus an aristocracy within an aristocracy would be formed.

Mr. Leander F. Herrick of Worcester, Mass., pointed out the advantages accruing to the individual breeder through coöperation with others in selling his product. No one breeder could present the number and variety of purebred animals for sale that several acting together could; nor could he with his comparatively small offering attract the buyers that a large, well-managed sale would.

In the absence of Mr. H. A. Moyer, who was expected to speak of the development of the dairy cow, Prof. V. A. Moore of Ithaca, took the floor and gave an interesting talk upon contagious abortion in cattle, which disease he considered an even greater menace to dairymen than tuberculosis because of our lack of knowledge concerning its detection and control. While a serum has been devised that will show the presence in the blood of the organism causing this disease, it does not show whether the cow has aborted and become immune, or whether she is in condition to abort at some future time. Dr. Moore does not believe that the germs of contagious abortion are eliminated from the cow until shortly previous to abortion, and subsequently. They are then eliminated in the milk and the uterine discharges and may be conveyed to other cows by food or litter which has become soiled by these. The contagion may remain in the milk for an aborting cow for months, having been demonsarated in one case four years after the occurrence of the original trouble. It may also be transmitted from one cow to another by the male in the herd. No fully satisfactory treatment has yet been devised, though the methylene blue treatment now being studied at the Vermont Station holds out considerable promise. Disinfection and cleanliness of stables and their surroundings are still essential to the prevention of this disorder.

Lieut. N. C. Shiverick of Avon, gave a practical address upon horse breeding in which he urged the necessity for State aid to this industry. Laws preventing the registration of unsound stallions as well as of those not purebred are needed, and the offering of prizes at the State Fair for the best brood mares would encourage the keeping of these in the State. New York should produce at least part of the 80,000 horses now brought into the State annually, and it should also receive its share of attention from the Federal government in the matter of the distribution of stallions for the production of army remounts. Lieut. Shiverick was followed by Dr. J. F. Devine, of the State Department of Agriculture, who gave an informal and very instructive talk about many of the common ailments of horses and colts which might be treated, or at least given intelligent attention by the owners of the animals. M. B. D.

REMOVING ROOSTER'S SPURS.—Take your rooster by the feet, head down, clap your fine saw flat against leg, drop spur, and you soon will find leg smooth and rooster not lose a feed. To dishorn sheep, cut smooth to head the same as cattle. I drop horns any time in the year, and never lost a case, nor any trouble yet. L. D. A.

THE ROOSTER QUESTION.—Page 25, R. P. worries about his roosters fighting. Last Spring I put 20 cockerels in my breeding pen with 200 hens. The finest cockerel in the bunch I took down town and put in exhibition for two or three days. When I brought him back he was a stranger, and they all jumped him. He spent the afternoon licking the whole bunch, and the rest of the breeding season he amused himself knocking the others. The consequence was my eggs only ran 97% fertile at the first test out. Tell R. P. to go off somewhere and crack hickorynuts, and let the roosters fight if they want to. G. H. S.

Rock Bottom
on the Very Best
Steel Roofing
Ever Made

This is positively the greatest steel roofing proposition ever made. Before you invest in new roof covering, siding or ceiling for any building you should first learn about the *one* best—by far the best from every viewpoint, and cheapest.

Reo Steel Shingles

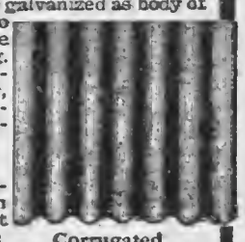
Edwards *Tightcote* Steel Shingles

actually cost less and *outlast three ordinary roofs*—last a lifetime—when the building wears out you still have the roof—never needs painting or repairs. It is *rot-proof, fire-proof, rust-proof,* and guaranteed *lightning-proof.* Any one can lay it, right over old shingles if you like. No special tools or experience required.

Spanish Metal Tile

Edges and Nail Holes Can Never Rust

Each and every sheet of Edwards Galvanized Steel Shingles, Roofing, Siding, Ceiling or finish is extra heavy galvanized, piece at a time, by our exclusive TIGHTCOTE patented process after sheet has been stamped and resquared. Side and edges are as heavily galvanized as body of sheet. Means no weak spots to rust and corrode. Don't confuse with ordinary galvanized roofing. By Edwards Patent Interlocking Device, see illustration below, all nails are driven through underlayer of metal only—no exposure—no leaks.

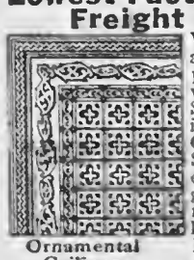


Corrugated

How to Test Galvanizing

Take any other piece of galvanized metal, bend it back and forth three or four times, hammer it down flat each time—then take your finger nail and flake off the loosened galvanizing. Make this same test with a piece of Edwards TIGHTCOTE Galvanized Steel Roofing—then note that the galvanizing is solid to the very edges—not a bit will flake off. Proves that not the space of a pin point can possiby be exposed to the weather and cannot wear out.

Lowest Factory Prices Freight Prepaid



Ornamental Ceilings

'V'-Crimped

We manufacture and sell all of the patterns of Edwards Reo Steel Shingles, Roofing, V-Crimped, Corrugated, Standing Seam, etc., painted or galvanized—or other building material direct from the largest and most up-to-date Metal Building Material Factory in existence, at rock-bottom factory prices. You keep the middlemen's profits in your pocket. We pay freight charges and give a permanent, binding guarantee against lightning losses—backed by our entire capital and resources.

A Studebaker that served 4 masters in 49 years and still on the job

NEARLY half a century of usefulness is the life history of a Studebaker farm wagon, at present owned by Levi Dallas of Topeka, Ind. A letter received by Studebaker states:

"I bought a Studebaker wagon in July, 1864 from Mr. Walsh, your dealer at that time at Goshen, Ind. I had the wagon eight or ten years, then sold it to a neighbor, John S. Yoder. The wagon was then sold to Thomas Cullet. When Mr. Cullet died the wagon was sold to Levi Dallas who lives two miles east of Topeka, who now owns the wagon and who is using it right along."

THIS IS CONCLUSIVE PROOF

It is economy to buy a Studebaker Wagon. Suppose the wagon now owned by Mr. Dallas which was purchased in 1864—cost at that time $110.00—divide the amount into 49 years—the wagon has cost $2.24 per year—and every year it continues to give service it reduces the cost per year.

If some other make of wagon had been purchased at a cost of $90.00 and that wagon had lasted the usual life of such a wagon—ten years—or to be liberal let us say 20 years—divide the cost into 20 years—that wagon would have cost $4.50 per year, or twice as much as the Studebaker wagon, even though the Studebaker cost $20.00 more at the time of purchase.

The same thing holds good today. Don't let a dealer sell you a wagon "just as good" as a Studebaker, even if you could buy it for $25.00 less.

Studebaker has been building wagons for over sixty years and there are thousands and thousands of farmers all over the country who are using Studebaker Wagons today that were purchased anywhere from 35 to 50 years ago.

And remember, Studebaker Buggies and Harness are just as reliable as Studebaker Wagons.

The Henyard.

Care of Laying Fowls.

What would be reasonable to expect from a pen of 75 pullets at this season? I divide four quarts of grain, one buckwheat, one cracked corn, one wheat, one quart oats, equally between three pens of 75 each; at noon they are given four quarts Alfalfa, having had boiling water turned on and let stand two or three hours, four quarts bran, four quarts mildlings, four quarts meal, two quarts beef scraps, one-half pint oil meal, and handful salt mixed together and divided. They are given cabbage, apples, small beets and sometimes sprouted oats, to work at besides the dry mash. At night they are given a good handful apiece of eight quarts cracked corn, four wheat, two quarts oats, two quarts buckwheat mixed. Fresh water is given three times a day, oystershell and grit are kept in hoppers. Dropping boards are cleaned each morning and clean chaff is scattered over them; each pen is given a dust box of sifted coal ashes. W. E. D.

I think that you can reasonably expect a 30% to 40% egg yield from your pullets in January if they were hatched in April or before. Your method of care and feeding is good, though if you are not giving the fowls access to dry mash in addition to the food that you mention, you are feeding very lightly, it seems to me. Four quarts of grain is a very light breakfast for 225 pullets, 18 quarts of mash for dinner and a handful of grain apiece for supper is also a long way from overfeeding; I presume, however, that you are giving dry mash in addition, as you mention it. While it is impossible to judge accurately as to your feeding, at this distance, I suspect that it is more food rather than a tonic that your pullets need. M. B. D.

Substitute for Trap Nests.

I wonder whether there has been any way devised by which a woman who is too busy to watch trap-nests as carefully as possible, could arrange her chicken house so that the hens would sort themselves into layers and drones each day? The trip or two could be managed, but I have tried the regular traps that one has to remove the hens from, and find I cannot devote so much time to it, although I am most anxious to breed and cull along egg lines. If anyone has devised a satisfactory way, I sincerely wish that he would pass it on. MRS. R. B.

Niles, Mich.

I know of no satisfactory device that will take the place of the trap-nest in picking out the layers from the drones. I am reminded, however, of a device, a description of which was sent me by a friend in Washington, D. C., who frequently has business in the U. S. Patent Office. This device was to be attached to a hen at the vent in such a manner that the egg when being laid came in contact with a self-inking attachment, that marked the egg. One of these devices had to be attached to each hen. A copy of the "claims" as filed in the patent office was sent me, and is probably somewhere among my papers now. On paper it looked quite plausible—in practice I doubt if it would work. I have heard of other devices, but have never seen them. Perhaps some of THE R. N.-Y. readers know of them. Most trap-nests are not made deep enough from front to rear. They should be 24 inches deep, so that the nest part would be far enough back to allow of room for the hen to stand comfortably when entirely outside of the nest proper. This prevents the breaking of the egg by the hen's attempt to escape, also prevents or lessens the liability of the nest becoming soiled by the droppings, where the hen is not promptly removed. With such nests no great harm is done if the hen has to be confined an hour or two. But plenty of nests must be provided.

GEO. A. COSGROVE.

Alfalfa Hay for Fowls.

How shall I prepare and feed Alfalfa as a separate feed to take the place of green stuff like cabbage, beets, etc? What is your opinion of its value? S. F. H.

Alfalfa meal is usually mixed with the ground grains as a mash, fed either wet or dry. If you have short cut Alfalfa, either home-grown or purchased, you can steam it by turning boiling water upon it in a covered pail, or it may be fed dry, though this is more wasteful. If the hens do not readily eat the steamed Alfalfa, mix a little ground feed with it. It is not to be expected that they will eat the coarse stems, but they should clean up the leaves and finer parts. Alfalfa does not exactly take the place of succulent food, like cabbage; it is a food of a different class, still it is a fair substitute if roots are not to be had, and it or clover should be fed anyway when available, as it is one of the best poultry foods. M. B. D.

Poultry Questions.

1. For Leghorns, would you prefer one-half buckwheat and half scratch feed in the morning? 2. I want to set 1000 eggs by April 15, one batch after another. Would you advise a hot water or dry air incubator? 3. I have two roosters, good birds, and 25 hens, two years old. The roosters are one year old. Is this mating desirable, and does it tend to produce pullets? 4. Can I save the eggs from now (early January) until the first of February? 5. Does an early pullet moult before it lays? 6. How many quarts of feed would you suggest to 100 Leghorns, mash feed morning and night, damp mash for dinner?

New York. C. H.

1. Buckwheat is one of the standard grain foods for poultry, but may be fed more heavily in the Winter than in the Summer, being of a fattening, or heating, nature, like corn. I would not recommend making the grain ration one-half buckwheat; one-fourth to one-sixth would be a better proportion. 2. There is no difference in the chicks hatched in hot-water and in hot-air incubators, the source of the heat being utterly immaterial, as far as the chicks are concerned. The hot-air machines are the most popular, however, and in the larger sizes, especially, are probably to be recommended. 3. Two-year-old hens, mated with yearling roosters, should give good results as breeders if all are of sufficient vigor to insure fertility. There is no tendency toward either pullets or cockerels in the progeny of this, or any other, mating, so far as known. 4. Eggs for hatching should not be kept longer than two weeks, if possible to avoid it. After this length of time, their hatchability decreases rapidly. They should be stored in as cool a place as is available while being kept, but the temperature should not, of course, reach freezing. 5. If hatched too early, before the latter part of March in this latitude, a pullet is apt to lay a few eggs in the Fall and then molt. Pullets or hens will lay as well when there are no males in the flock, and except during the breeding season, males should be kept out of all flocks from which eggs are sold. 6. One hundred Leghorn hens should have from four to six quarts of whole grain, fed twice daily in the litter, when they have a mash also at noon. These amounts cannot be definitely fixed, however, but should be varied according to the appetites of the hens. M. B. D.

Late Molting.

I have a flock of B. P. Rocks 1½ years old; were heavy layers all last Winter and last Summer, but as yet they have have not shed a feather, and have about stopped laying. What is the trouble with them, and are they worth keeping?

Thomaston, Me. R. P. C.

Hens that are very late in molting have been given a certificate of good character by recent investigations which seem to show that the hens that continue to lay through the late Summer and begin molting late are the hens that make the best yearly egg record. Early molters are under suspicion, nowadays, and are excluded from the breeding pens; so the fact that your hens have laid well, and haven't stopped to molt, should be a matter of satisfaction to you. M. B. D.

A FARMER'S GARDEN

Helps his wife to plan her table in busy times. Saves work and worry, saves buying so much meat, gives better satisfaction to the help. A good garden will be almost impossible in your busy life without proper tools. They cost little and save much hard work.

IRON AGE WHEEL HOES AND DRILLS

will sow, cultivate, ridge, furrow, etc., better than you can with old-fashioned tools and ten times quicker. A woman, boy or girl can do it. Can plant closer and work these hand tools while the horses rest. 38 combinations from which to choose at $2.50 to $12. One combined tool will do all of the work. Ask your dealer to show them and write us for booklet, "Gardening With Modern Tools" and "Iron Age Farm and Garden News" both free.

SELLING SCRUBS TO NEIGHBORS.

Hard Bought Experience.

"If you have a scrub cow don't sell her to your neighbor," says Bert Smith, a prominent Ohio dairyman. "Send her to the block. If a man goes out to buy a horse, if he deals with a horse jockey, he knows what he will be up against, and will expect to be stung. When a man goes to buy a cow, even his best friend may sting him the worst. I believe I have had as many worthless cows saddled on me by honest and well-meaning men, as any man in the dairy business. I have fallen down, faced discouragement and financial loss 10 times to the average farmer's once, but I got up and went ahead. If I could not face a business proposition on the farm, I would back up to it, and try to get at it that way.

"I started nine years ago on my farm in Delaware county, Ohio. It was so poor it would not grow pennyroyal, only in the fence corners. Mullein would grow but a foot high, become discouraged and die. I thought I would go in the dairy business, and I would build up the soil in two or three years, and become rich in a short time. Well, I started buying cows. I secured 11 from around the country. Some were red, some black and some brindles. Anything and everything that was a cow, I bought. I cared for these cows, milked them, kept accurate figures on my expenses and at the end of a month, I balanced up. I'll tell you it was a mighty hard blow when I saw that I only had 10 cents to my credit. I didn't offer these cows to my neighbors, but I called up the butcher that night, told him to come to the farm and look over my herd for there would be something doing.

"The butcher came out early the next morning. I took him through the stable; he placed a price on this cow, and that one, until he had established figures on the entire herd. I hung my head; it would make any man hang his head, when he has hoped for easy dollars and cents. I asked him how much the entire herd would bring, and he figured again on the cows, and made me a price for the entire bunch.

"'They're yours.' I told him. I then visited an old friend who had taken a heavily mortgaged farm, and paid for it with Jerseys. I talked with him nearly a full day. I came away filled with enthusiasm believing the Jersey, regardless of ancestry or efficiency, would put profit in my purse. Every one in our whole county who had an old scrub Jersey for sale, wrote or 'phoned me, and I was chasing everywhere for Jerseys. They said I was Jersey mad. Here is where I failed again. I bought regardless of certain characteristics which are so strong they will give the wise buyer a stunning blow. I just bought Jerseys; I didn't know anything about distance between the eyes to denote intelligence, large capacity in the barrel to denote magnificent storage capacity for food, a capacious pelvic region or commodious arch for the udder. I paid little attention to the wandering milk vein, and the deep milk well. I knew nothing of the characteristic wedge-shape appearance of the cow. I bought Jerseys, and looked for big udders. I was lucky once; one farmer told me he had a Jersey he would sell me, and I hurried to his farm before daylight. I was mighty afraid that someone would get there and buy first. The cow was eating around a straw stack. I saw a nice heifer in another part of the barnyard. I asked to buy that heifer. The farmer refused but pointed to the old cow. I asked him to answer honestly two questions: one whether the dairy business paid him, and the other whether he intended to remain in it? He swore he would answer me truthfully, and declared there was no more paying business, and that he intended to remain in it. Then I said, 'You need her in your business and by all means keep her.' I visited another farm. One cow with a magnificent udder attracted my atten- The owner said the cow was his wife's private property and he could hardly think of selling her. I got anxious and finally he said if we could slip the cow from the barn down through the lot without his wife seeing her, he would consider a price. This was made, and it was a good one. When I got the cow home, I called my family to the barn. The udder was wonderful in proportion, and I expected I would have to milk her in a wash tub. I milked about two quarts and the udder was as large as before. I found that there were characteristics associated with dairy production, and only after years, the cost of dollars and cents, hard work, and no profit, I learned the lesson of selecting a dairy cow. I have bought cows for $50 when cows are lower than they are now, and turned around and sold them for $10. It cost me what the young man cannot afford to spend, and that is valuable years of my life.

"After learning characteristics of a good dairy cow, I applied the scales and Babcock test to my herd. If you have a $200 cow, she is worth keeping, but if you have a $60 cow, she is not worth $25, and I wouldn't have her on the farm. I had something to learn about difference in butter fat in cows. I thought that butter fat could be fed into a cow in the form of grain and commercial feeds. It cost me dollars and cents to learn this lesson. Our local creamery man tested by the gravity method, and invariably our herd stood at 4%. I thought he knew his business, because the test remained constant month after month. When a new man came, used the Babcock test and I found my test running above and below, I thought he gave me a good test to offset the low test of the preceding month. I finally took a sample of my milk down to the Ohio State University for test. I handed the sample to the laboratory assistant. He told me he could not test that for I had churned it by carrying it. He told me to take another sample, which I did. I took that down, and it tested between eight and 10%. That astonished me. The assistant asked me if I secured a good composite sample. I told him I secured it from the middle. I milked the cow half out, then milked the sample from that before completing the milking. He then told me how to secure a proper sample by pouring from one pail to the next, and how that the test varied from a fraction of one per cent in early milking to 12% in the strippings.

"I found the only way to put profit in dairying was to use the tester and scales. I had a good many hard lessons to learn, I was discouraged, but I got up and went ahead. I spent considerable money, a large amount of time, and I have many things yet to acquire. The young man cannot afford to learn them in the way that I did, he has his farm paper, has the benefit of the experiment station, the agricultural college, and the experience of the older men who have made the grade, all as a foundation on which to establish his farm practice."

W. J.

Purebred Strains; Sawdust Packing.

In making up a stock of purebred hens, could they be built up of different strains? Mine are purebred S. C. Brown Leghorns. Could I mix some other strain with them if the strain was purebred S. C. Brown Leghorns and their combs were high like the hens I have now? Could I put them on the market as purebreds for utility breeding purposes, or would the flock not be purebred on account of being made up of different strain? Is sawdust all right to pack eggs in for hatching purposes, to ship by express? Would the sawdust have to be from dry wood or would it do from green wood if the sawdust was dried? If not is there anything on the market I could buy? As I have no chaff from a hay mow to pack them in? I. E. B.

Franklinville, N. Y.

Fowls that are purebred are those whose ancestors for an indefinite number of generations have not been crossed with any other variety, while the much-abused term "strain" should be used to designate fowls which have been bred for a considerable length of time by some one who has had a definite object in view, and who has bred to that end. Thus we have in Mr. Barron's purebred Leghorns a strain that has been developed as layers. In practice, however, any poultry breeder of several years standing seems to consider himself entitled to designate his fowls as a "strain" of his own breeding. Thus you will see that your S. C. Brown Leghorns are purebred, no matter how many "strains" are represented in the flock. Thoroughly dry sawdust should be satisfactory as a packing for shipping eggs, though if wet, it will stain them. The best material for this purpose that I know of is buckwheat hulls, which may be obtained at any grist mill where they grind buckwheat.

M. B. D.

The Automobile King HENRY FORD

Employer of 17,000 men, is the *greatest mechanical expert* and *factory manager* the world has ever seen

He knows material and construction from A to Z.

He knows a good thing when he sees it, in separators as well as automobiles, having studied farming intensely as well as mechanics.

Mr. Ford owns **three dairy farms.** On each of these three farms he uses a

UNITED STATES CREAM SEPARATOR

Mr. Ford is not an exception in his selection of a cream separator, for most of the other captains of the automobile industry use the **United States Cream Separator** and will have no other. Among them are:

H. M. Leland, *Cadillac* — **W. E. Flanders,** *Maxwell*
H. B. Joy, *Packard* — **G. C. Hupp,** *Hupp*

Don't you think you can well afford to have a **United States Cream Separator,** which holds the **world's record** for **closest skimming** in **fifty** consecutive runs lasting **thirty** days, with milk from **ten** different breeds?

AILING ANIMALS.

Limewater for Veterinary Work.

Please tell how lime water is prepared?
Pennsylvania. P. C. H.

Pour a quart of water on a lump of quicklime the size of a walnut. After the lime is slaked and powdered strain off the clear liquid for use as lime water.
A. S. A.

Splints.

Please advise me how to treat splint on a horse's legs if it is curable. A. N.
New York.

Organized splints remain as permanent blemishes despite treatment. Lameness may be remedied and a splint somewhat reduced in size by early blistering with a mixture of one dram of biniodide of mercury and one ounce of lard. Rub it in for 15 minutes after smearing lard under the affected part. Tie the horse up short so that he will be unable to lie down or rub the part. In three days apply lard, but do not wash the part. Then apply lard daily and allow the horse liberty in a box stall. Blister repeatedly at intervals of three or four weeks if found necessary. A. S. A.

Pig-eating Sows.

I would like advice about what to do with sows that eat their pigs when they are a few weeks old. We have several that before they have pigs we put in a small pen to get them away from the rest of the hogs and when they farrow they sometimes eat them the same night, we keep salt before them at all times.
Colorado. B. T.

Allow sows abundant exercise and mixed laxative rations, get them accustomed to the presence of man and they will not be likely to eat their pigs. It is the soft, pampered, fat, sluggish, cross, nervous, constipated sow that eats her pigs. Adding 10 per cent of digester tankage to the feed of brood sows also tends to prevent the vice. A. S. A.

Cribbing.

What causes a horse to catch the front teeth of the upper jaw on manger, open the mouth and make the noise usually called cribbing? Is there any way of stopping it and what is the effect on the animal if it is left to indulge in the habit? M. H.
New York.

Cribbing and windsucking is an incurable vice learned by colts when cutting teeth, or idle in the stable or by imitation from a confirmed cribber. It causes chronic indigestion and ill thrift. It may be temporarily stopped or greatly relieved by buckling a strap around the neck just back of the throat-latch. Keep the horse in a box stall from which has been removed everything upon which the teeth or chin could be set to practice the habit. Feed from the floor level. A. S. A.

Indigestion.

I have a mare eight years old, goes to station two miles each way morning and night; no work Sunday or Monday or Thursday night, or Tuesday or Friday morning; is in box stall. I feed 12 quarts oats a day; every three months her hind foot swells from hock down, different foot each time. If let stand while in harness she will lie down. She eats all the wood about the stall, and is very thin. J. C.

Such treatment well might cause chronic indigestion. Have the teeth attended to by a veterinarian; then make the mare work or abundantly exercise out of doors every day. If her coat is long and coarse clip it from belly and from legs above knees and hocks. Bed with planing mill shavings or sawdust. Feed whole oats, wheat bran, carrots and mixed clover or Timothy hay. Medicine is unnecessary, but allow free access to rock salt. If her legs incline to stock, as they have in the past, from lymphangitis and poor circulation, rub them dry each time she comes into the stable and then bandage from feet to knees and hocks. A. S. A.

Depraved Appetite.

I have a Jersey heifer that has not done well in the last five months. She is 18 months old. She eats, assimilates and feels well and is bright and sprightly. Temperature, pulse and respiration are normal. Was tuberculin tested, with the rest of the herd, last January, with negative results for all. In September she, with others, got at a pot of paint and one died as the result. Gave antidote, no bad effects observed in this one at that time. She has not grown like her mates and is very thin in flesh. I have not bred her because she is so thin. She craves soiled rags and straw, eats dirt and beach sand, tries to lap your hand and clothes, has an abnormal appetite for salt and drinks about a third more water than others of her size. What is the trouble and what the remedy? Would you advise breeding her? R. F.

Do not have her bred while she is in an unhealthy condition. Foreign bodies in the stomach, or an abscess or tumor often cause such symptoms of chronic indigestion, or a needle or pin or nail may be lodged in the wall of the heart. If a foreign body, abscess or tumor is the cause treatment will not avail; but it may be a case of chronic indigestion from more ordinary causes and if so treatment may do some good. Acidulate her drinking water with hydrochloric acid. Use just enough acid at first to slightly sour the water, but gradually increase the acid, taking care of course not to make it strong enough to cause discomfort. Make the heifer live out of doors as much as possible, but where she cannot pick up foreign bodies. Feed Alfalfa or clover hay and mixed grain ration, including wheat bran, flaxseed meal and silage or roots. Write later if necessary.
A. S. A.

Indigestion.

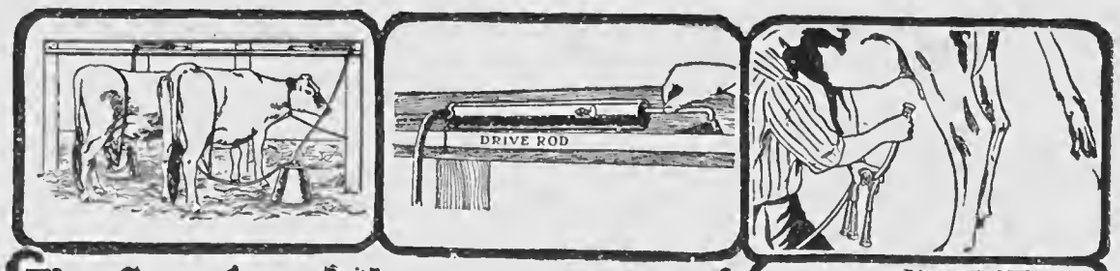
Will you inform me what it means when cattle will lick sand. I have a herd of Holsteins (17 head) in good milking condition averaging 35 pounds of milk per day and fed on the following ration. They get all the corn fodder they care for, fed to them in the barnyard. I make up a mixture of 500 pounds dried brewer's grains (moistened), 300 pounds hominy feed, and 200 pounds of cottonseed meal (42 per cent protein). I feed about 15 pounds of this mixture to a cow per day and in addition to this each cow gets all the black grass hay they care for and 50 pounds of mangels. I have salt bricks attached in the manger. My cows have been licking sand some time. I think that something must be wrong with the feed ration. K. G.

You are overfeeding and wasting feed and besides that causing indigestion. Add one part corn meal, and one part wheat bran to the ration and of the mixture allow one pound for each four pounds of milk given daily by the cow. If possible allow good clover hay in addition to the corn fodder and roots. We are not posted regarding black grass hay, but take it to be some form of marsh hay. Give the cows outdoor exercise every day.
A. S. A.

Scours in Calves.

I would like to know what to do for scours in calves six weeks old or under. When skim-milk and oil meal is fed, how much should be fed each week after the first till they are six weeks old? If calf meal is fed, should less oil meal be fed? At what age should young calves be treated to keep their horns from growing and what is best for that purpose? What is the best remedy for colic in a horse? Are pumpkin stems good for colic in either man or beast? The stems should be grated in order to use, and then steeped. R.
Oregon.

Mix together half an ounce of formaldehyde and 15½ ounces of freshly boiled water and keep it in an amber colored bottle; of this mixture add one teaspoonful to each pint or pound of skim-milk fed to a calf that has shown signs of scouring. If scouring has started give a dose of castor oil in milk before giving the drugged milk. In bad cases give one tablespoonful of alum in a pint of warm water at one dose 12 hours after feeding milk and repeat when seen to be necessary. Do not give alum when milk is being fed. We have also had good results from giving one or two tablespoonfuls of sulphur in milk or water as a drench to scouring calves. Give it every two or three hours, according to severity of case. Kill horns on calves thoroughly by rubbing the dampened skin over the horn buttons with caustic potash stick before the calf is a week old. There are many different forms of colic and no one remedy is suitable for all. Give us the symptoms of the form of colic you have in mind and we will be glad to prescribe. On general principles it always is safe to give a pint of raw linseed oil and half to one ounce of laudanum may be added for pain. We cannot answer relative to pumpkin stems for colic. We have never heard such a claim made. A. S. A.



Five Seconds and the Hinman Cups Are On

The HINMAN is at work—the milk is flowing swiftly and silently into the pail. Vacuum pressure put on teats gradually. Released 45 times a minute. The one-piece tapered teat cup with simple rubber mouth-piece imitates natural method of milking.

Hinman milked cows are the big money makers. The Hinman operator is rapid and thorough. The single tube from the pail makes handling easy. No wet unsanitary milking. One man with a Hinman outfit can do the work of three hand milkers. 60,000 cows milked daily with the

HINMAN Milker

The Machine Your Wife or Son can Handle

Because it's light, easily adjusted and easy to clean. The vacuum valve chamber is in the pail cover. It allows the operator to move machine easily and change pails rapidly as there is no vacuum in the pail. Each cow's milk kept separately.

Attaching HINMAN Cups

These are only a few of the exclusive HINMAN features. You'll find all the others in our free illustrated booklet, "How One Man Can Milk 25 Cows an Hour." It will mean that you will buy a Hinman. Agents everywhere.

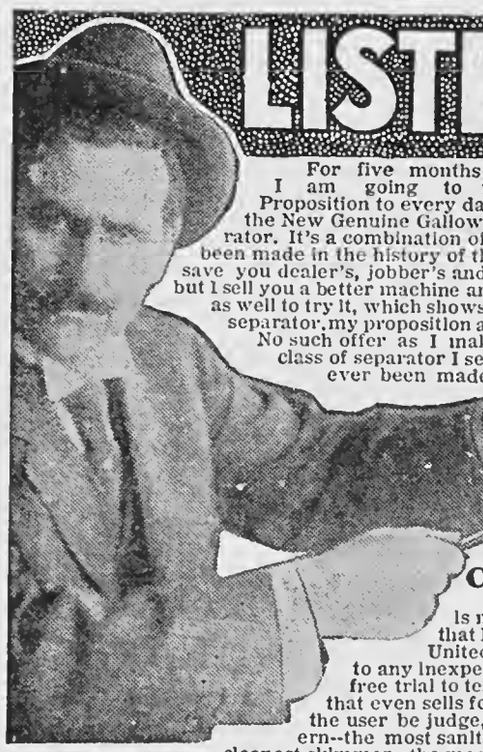
LISTEN! Read This Twice



For five months starting February first I am going to make my New Special Proposition to every dairyman in this country on the New Genuine Galloway Sanitary Cream Separator. It's a combination offer. Its equal has never been made in the history of this country. I not only save you dealer's, jobber's and catalog house profits but I sell you a better machine and give you a bonus as well to try it, which shows my faith in my separator, my proposition and my plan. No such offer as I make on the class of separator I sell has ever been made.

The New Galloway Sanitary Cream Separator

Is made so good in my factory that I will send it anywhere in the United States without an expert to any inexperienced user for a ninety day free trial to test against any make or kind that even sells for twice as much and will let the user be judge, because it's the most modern—the most sanitary—the most scientific—the cleanest skimmer—the most beautiful in design of any cream separator made today and I have seen them all. Write me and I will tell you how to make money in the dairy business when the pastures are dried up in summer. I did it on my own farm and know. Get my proposition now. It's so good that no dairyman who owns two or a hundred cows can afford to be without it. All I ask you to do is to first get my proposition before you decide to purchase any cream separator of any make, kind or at any price. Just drop me a postal. Address

Wm. Galloway Pres. William Galloway Co.
273-B Galloway Sta. Waterloo, Iowa

Travel 20,000 miles, look over every factory in the United States and all of the foreign countries—you won't find its superior at any price.

Made in our own factory from finest materials on best automatic machinery, by skilled workmen, in tremendous quantities, all parts alike, interchangeable, and standard and sold to you for less money than dealers and jobbers can buy machines not as good in carload lots for spot cash.

Farm Management.

The Location of Farm Buildings.

There is a phase of farm management to which I would like to call attention as one of a great deal of importance, and that is the locating of farm buildings. To very few of the present generation here in the East comes the chance to locate an entire new set of farm buildings but to many come the repairing or building or rebuilding of one or more, and all of us are affected by our own or some one's else success or failure in that line. It seems sometimes as if some of our ancestors did not use much judgment in the location of their farmstead, but perhaps it is because times have changed, and what was most convenient in those days is not so now. I do not think that locating the barn or barns across the road from the house is an ideal arrangement for two reasons: First, because the front of the house generally faces the road, and as a back door is generally used when going to and from the barn it necessitates too much travel in doing the daily chores. Second, if the barn is directly in front of the house the view is obscured and if it is far enough to one side to remedy that, more travel is caused. Yet in traveling through the country one sees very many farms with the house one side of the road and the barn on the other side.

I call to mind one instance of a very inconvenient location of buildings. The horse barn is on the east side of the road, the house on the west side and a little south of being directly opposite the barn. The cow stable and other barns are a little way back of the house. Every time the farmer has occasion to go to the horse barn he comes out of a door in the back of the house, goes around the south end of it and diagonally across the road. When he draws his milk to the station he has to go to the horse barn, hitch up his horse and drive across the road past the house to the cow stable after the milk. When he comes back from the station he has to drive over to the cow stable again with the empty cans, or else carry them over. The cow pasture is back of the horse barn, so he has to drive the cows past the house and across the road four times every day through the Summer. Figure if you can how many miles that man or some of his family travel every year in just doing chores. And the present owner of the farm is getting the benefit of some one's lack of judgment.

In locating a set of farm buildings there are several things to be considered. First, contour of the land. The buildings should be on a slightly higher elevation than the road, with the house on rather higher ground than the barns. They should not be in a place too much exposed to wind, neither should they be in a hollow where all the damp, foul air settles. If a hilly farm they should be where the bulk of the hauling would not be uphill. Second, ease of access to the highway and different parts of the farm. The buildings should not be very far from the road, neither should they be too close to it. They should be as near the center of the farm as possible; one corner is not usually satisfactory. The location of the permanent pasture (if there is one) should be borne in mind, also the water supply for the stock, as well as the house. The barns should be so located in relation to the house as to require as little travel in reaching them as is consistent with sanitation. They would be better not to be in a direction from the house from which the prevailing wind blows.

The barns (if more than one are built) should be conveniently located in regard to each other so that the most work can be accomplished with the fewest steps. In these days of high-priced labor (and scarce at that) every move must be made to count. It is a good plan when one is contemplating erecting new buildings or remodeling old ones to visit as many up-to-date farms as possible, where everything is arranged conveniently, and study their methods. Get all the information you can before you begin. Make a plan of what you consider an ideal farmstead for your location and do all your building and remodeling with that plan in mind. Combine utility, capacity and convenience. A. S. M.

A Drainage Question.

I tile-drained a piece of very wet land last Fall; that is, I put in the laterals, leaving the main ditch open. For about 200 feet up from creek land is nearly level; from there up to head of laterals there is about four feet rise. There will always be water in drains, as they are fed by springs that never dry. In order to get tile down at a safe depth, say 2½ feet, I shall have to begin at creek and put them down at nearly the creek bottom, with very little rise for 200 feet. Mouth of tile, or outlet, will be free for three or four months during Summer, as creek is then low; but how about high water? During high water creek often overflows its banks. I shall have to use six-inch tile at least, and there is water enough in ditch now to fill it. I do not wish to leave it as an open ditch. Is it practicable to lay tile under such conditions? This piece of land contains about five acres, was very wet; water always stood on it, nothing growing but cat-tails. It dried out very soon after ditch was dug. I drew several loads of tile over it. I wish to plant Eureka corn next Spring. Would you advise liming it? Would you try it one year without phosphoric acid or potash? Soil is muck from three to five feet deep.

Watertown, N. Y. L. W. S.

There is some danger of silting in a pipe laid under these conditions, but if care is taken to make the joints close, and no silty material is placed directly on the tile, one should be able to make a lasting job of it, and as the laterals have been in for a time the ground will be settled around them so they will not be running silt into the main. Muck of that depth with living water that can be controlled for sub-irrigation is pretty good property, with the right "man behind the plow." All such soils are deficient in potash and phosphoric acid, and too sour for the nitrifying organisms to convert the inert nitrogen into nitrates sufficient to meet the needs of growing plants; hence after draining, lime is used to promote bacterial action, and some celery and spinach growers find profit on their muck in the continued use of fertilizers containing four or five per cent. of nitrogen. J. F. V.

Know What They Cost.

Those articles on page 144 by E. G. Whitmyre and on page 162 by O. W. Mapes should make more farmers realize the importance of keeping track of costs. It would be a revelation to many to know what trouble and expense manufacturing plants take in keeping account of costs. I do not know of a better way to use some of the days in Winter for a good many than figuring up costs to find out the results of the past year's work. It would be the most profitable work done. Very little time is required each day in the working season to keep such records which can be gone over and worked up later on. Farm bookkeeping is not the panacea that is going to overcome all the troubles or make an assured success of the unfitted, but the man who keeps such records carefully and can compare the results from year to year is much more certain to get his business on a paying basis than the man who believes he can tell from his general knowledge what a particular line is paying him. It is the exception when you find a man who knows what his crops are costing; for instance, how much it is costing per day for his horse work, or what his horse work on the corn crop amounted to last year. Those who think they could not take the time to keep complete records should at least on one crop keep a careful account and it is very likely the result would be surprising enough to lead to keeping complete accounts.

Pennsylvania. E. R. JOHNSON.

"Ball-Band" Rubber Footwear has Won the Friendship of 8 Million People by Wear and Service

For hard and constant wear, day in and day out, in slops and snow, you need Rubber Footwear made by men who understand your needs. Eight million satisfied users and 45,000 dealers can tell you that "Ball-Band" Rubber Footwear gives more days' wear for dollars invested—and the "cost per day's wear" test is the only true test of footwear.

"BALL (Red) BAND" TRADE MARK

Rubber Footwear

Look for the Red Ball Sign on the store window. Most dealers show it. Look for it on the goods. Strong duck, tough, high-grade rubber and extreme care in manufacture are the reasons why Boots and Arctics with the Red Ball trade-mark are cheapest in the end.

"Ball-Band" Footwear does not wear out until it has made the owner glad he bought "Ball-Band." Boots are made with either rubber or leather soles and in Knee, Storm King, Sporting and Hip lengths. If your dealer does not sell "Ball-Band," write us—we will see that you are supplied. Look for the Red Ball—if it is not on the goods you are not getting "Ball-Band" quality.

Write anyway for our Free Illustrated Booklet about "Ball-Band" Rubber Footwear

MISHAWAKA WOOLEN MFG. CO.
333 Water St.
Mishawaka, Indiana
"The House that Pays Millions for Quality"

The Power for Profits

Cutting your cost of farm power is the first thing you will notice in the Leader Tractor. It's a sturdy giant in power—yet weighs only 2½ tons. A. E. Thomas of Kissimmee, Fla., writes that he plowed with a Leader on sand and muck land where he could not drive a horse. It has *wonderful* adaptability, practical in fields as small as 5 to 10 acres. Write us—learn how easily you can cut your cost of plowing, disking, harrowing, drilling and all heavy work. In addition have power for running silo filler, threshing machine, husker and shredder, etc.

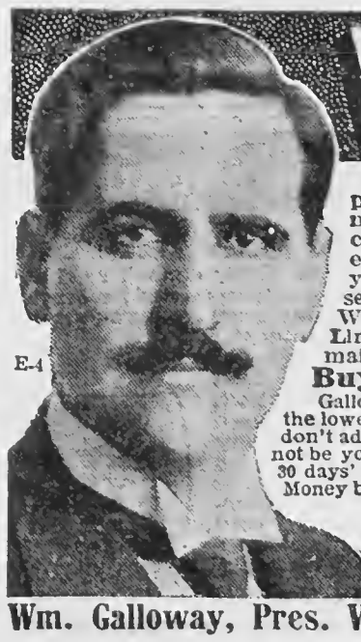
The Leader Farm Tractor

Does the work of 12 horses easily—costs no more than 2 or 3 to keep. It is the *practical* tractor for the farm of 120 acres to the section or more. No man with 120 acres up to a section or more should be without one. One man writes he sold 4 horses out of 10 and did twice his heavy work easily.

The Leader is made of chrome, nickel and vanadium heat treated steel. Gears are case hardened—run in oil, in dust-proof case. Built throughout with just the materials that give long, efficient service.

Write for Trial on Your Farm Our proposition is that you will not be asked to keep it unless you are satisfied in every way. Write today for trial offer. Ask for the Book of Farm Power. Address Dept. L1

The Leader Engine Co., 12-20 State Street, Detroit, Mich.



WANTED Ten Men in Every Township to Write Me for My New 1914 Special Offer! **Just Fill In Coupon**

Write me right now! Get in at the start on my new, whirlwind spreader campaign which means a lot to the first ten or more men in every township. It means the most liberal, profit-sharing offer you ever heard of in your life. A chance to get a Galloway spreader partly or entirely without cost to you in the end. Listen! I know you want to get the best manure spreader made. I know you want to buy it at the lowest possible price. That's only good, sound business sense. Then you can't afford to pass by this unheard of offer. Not by any means! Write me today for my new spreader catalog showing the complete Galloway Line and I will send you details of my new offer. Just fill in, cut out and mail the coupon or write me a postal—**Now!**

E-4

Buy Direct from the Manufacturer—Save $25 to $45

Galloway manure spreaders are made in our own factories and sold direct to you at the lowest prices ever made. You don't have a lot of middlemen's profits to pay which don't add one cent of value to any machine. Isn't that a fact? It certainly is! Then why not be your own dealer and buy on my direct from factory, money saving plan? With 30 days' free trial privilege—5 year guarantee and $25,000 bond back of every machine. Money back, with freight paid both ways, if not satisfied. Can you beat it? Never.

Valuable Book of Information

FREE "A Streak of Gold"

Every man owning ten or more acres wants my new book "A Streak of Gold." It's chuck full of valuable information. Tells How to Produce the Manure; How to Take Care of It; How to Cash It In. I'll send you a free copy when you send for my new spreader catalog. Fill in, cut out and mail coupon today or write a postal.

Laying Ration.

What is a good ration to make hens lay more eggs? Which is better for hens in Winter, a dry mash or a warm wet mash? H. A.

Cazenovia, N. Y.

I think that the largest majority of poultrymen now use dry mash, Winter and Summer, though I have little doubt that for a limited time, at least, a properly made moist mash would produce slightly better results in eggs. The greater danger of overfeeding where hens are being forced to large egg production, together with the greater cost in labor, more than counterbalance the slight advantage which a moist mash has over a dry one, and the latter is, I believe, coming into practically universal use on large plants in this country. The Cornell formula for dry mash is: 60 pounds cornmeal 60 pounds wheat middlings, 30 pounds bran, 10 pounds Alfalfa meal, 10 pounds oil meal, 50 pounds beef scrap, and one pound salt. A mixture of 60 pounds corn, 60 pounds wheat, 30 pounds oats and 30 pounds buckwheat, is used for whole grain, fed in the litter night and morning. M. B. D.

Forcing Egg Yield.

Is there any difference between the nutritive values of an egg laid by a hen that is forced, and an egg that is laid by a hen not forced, if both eggs weigh the same? Does a light yolk indicate less nutrition in an egg than a dark yolk? What are the causes of very light yolks, also very dark yolks? I keep S. C. W. Leghorns and Barred Rocks, feed the New Jersey Experiment Station ration, with some green food at noon, but a customer says the yolks are much lighter than those in eggs he had sent him from up-State, (New York); also claims that I am forcing my hens, therefore the eggs are not so nutritious. What is your opinion, and opinion of experts in this matter? W. E. M.

New Jersey.

I know of no reason for believing that the composition or nutritive value of an egg can be materially changed by feeding. The color of the yolk can be altered, it is true, and this indicates some change in the egg's chemical composition. This change is probably very slight, however, and due simply to the fact that some foods, as clover, contain a coloring matter which is transmitted to the fat of which the yolk is composed. If you will add clover or Alfalfa in sufficient quantity to your rations, I think that you will find that the yolks will become sufficiently dark to suit your customers. Forcing hens certainly cannot cause a deterioration in the quality of their eggs; for forcing is simply feeding a large quantity of easily assimilable egg producing food, and if it made any change, it would be to increase the nutritive value of the egg. Analogy, however, if not actual experiment, would suggest that feeding could no more alter the composition of an egg than it can of cow's milk. M. B. D.

Conerete Floor for Henhouse.

On page 22 the New Jersey Experiment Station, replying to Irving C. Lewis, states, that concrete floors do not, so far as they have observed, wear off hens' toes, but they do not explain that there is a difference in cement floors. Evidently Irving C. Lewis has floors made of sharp sand or gravel and left unglazed. This kind of cement floor is torture to hens. The method of glazing is simple. When making the floor obtain enough very fine sand to make the last half-inch of two-parts sand, one-part cement and puddling, or if fine sand is not procurable finish the floors off as smoothly as possible by puddling; that is, rubbing with trowel till water comes to the top, and then when set wash all over with clear cement, wetted to consistency of thick cream. If Mr. Lewis has an old rough floor it can be smoothed by washing thoroughly and skimming with clear cement, that is, coating as thin as possible. F. E. PARSONS.

Massachusetts.

A concrete floor that is laid wet, material below it containing a great deal of water, which will have a chance to pass downward before the cement has set, will have the cement nearly all pulled down from the surface, by the water, leaving the surface pretty much like the surface of a piece of sand paper. A concrete floor that is laid under conditions that allow the cement to set well without any perceptible amount of water passing down through the concrete, will have a fairly smooth cement surface if trowelled before it has set. The floor that has been left with a rough sandy surface by the action of water in pulling the cement and smaller particles of sand downward from the surface, may be given a hard smooth surface by coating it with pure cement mixed very thin with water, so that it may be spread over like a coat of paint. It takes very little cement to put on a coat this way. In case it is put on so soon that it settles partly into the body of the concrete, leaving a slightly rough surface, a second coat, after the first coat has set well, will give a very hard, smooth surface, so polished that the hens can hardly stand up alone on it.

Connecticut. GEORGE PHILLIPS.

Jim Rohan Will Tell You How You Can Make Big Poultry Money—Send for New Book of "Hatching Facts." Just out. A postal brings it.

I will send you my low price—direct to you—no middlemen's profits—my 10-year personal money-back guaranty—my 1, 2, 3 months' home test offer.

Two more World's Championship victories make the Belle City the 8-Times World's Champion Hatcher. No other incubator at any price approaches this record. The Belle City scores thousands of 100% perfect hatches. 276,000 Belle City outfits in use. Join the champions and get your share of the big money that will be made on chickens and eggs this year.

8-Times World's Champion Belle City Hatcher

My big portfolio, "Hatching Facts," illustrates my Belle City Incubator and Brooder in actual colors—shows that they have *every* feature worth having in and on an incubator and brooder—gives full information, proofs and all particulars. *My low price comes with it.* Better write today. A postal will do. Jim Rohan, Pres.

I guarantee to send you an exact duplicate of the World's Championship Machines

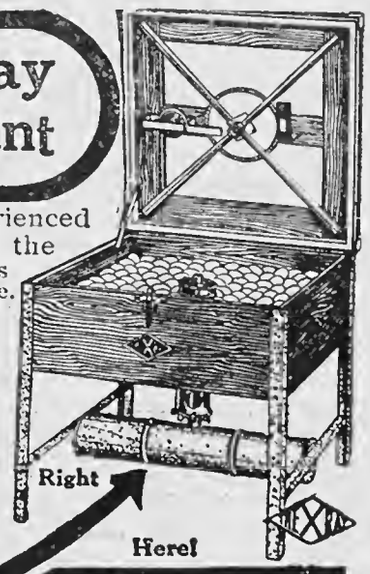
It's Because the X-Ray Has a Central Heat Plant



That's the reason it is winning the big experienced hatchers. Why not? The X-Ray way is the practical, common sense way. And because the lamp is in the center we can put a big oil tank below the machine.

1 Filling Only: 1 Gallon per Hatch; Saves 75c to $1.25 in Oil

We want you to know all about the construction of this machine and then you decide for yourself.

And It's Sold Direct with no agents or middlemen in the deal. Here is a machine that in saving of oil alone will pay for itself in a few hatches. Two-paneled double glass top enables you to see chicks, eggs or thermometer, saves the bother of filling lamps.

Send for the Big Free Book No.32. Find out about the big improvements in this machine.

Remember—we pay the freight.

Emerson Grain Drills Always Cover

Deposit of Seed at Axle Center Does the Work

All Emerson Grain Drills deposit seed at axle center. An exclusive patented Emerson feature. Seed comes down concave side of disc, passes through center of hub, and goes into ground before soil rolls in. Seed always planted at bottom of furrow. Insures even germination. Unnecessary to run Emerson discs as deep as others. Light Draft. Drills deposit evenly regardless of ground conditions. All machines equipped with independent spring lift. 10 or 12 discs or hoes raised with least effort. Emerson Feed combines best features of both fluted and double run.

Write for the Emerson Drill Catalog

The Henyard.

THE EGG-LAYING CONTEST.

The thirteenth week of the contest shows a decided gain in egg production; 987 eggs were laid, which is 248 more than were laid in the previous week. Of this gain the White Leghorns contributed 126, or more than half. Two pens tie for first place in this week's record, and both pens are Wyandottes. The high score is 33, made by D. J. Ryan & Son's White Wyandottes, and Dr. N. W. Sanborn's Buff Wyandottes. The second place is taken by pen No. 42, the "sour milk" pen of White Leghorns from Storrs Agricultural Station, with a score of 29; Cecil Guernsey's White Leghorns take third place with a record of 28, and three pens laid 27 each. They are Tom Barron's White Wyandottes, and the S. C. Reds of Dr. J. A. Fritchie, and Dearborn & Sharpe. Tom Barron's White Wyandottes still lead in the total score with 486 eggs to their credit. This is 84 eggs ahead of any other pen. Two pullets laid every day in the week, and both were S. C. Reds. Two of the S. C. Reds have died and one of the Leghorns.

Below is the score of some of the leading pens:

Their record is.....	10	152
	16	194

I have written Mr. Barron to learn how he explains the poor performance of his pen of Leghorns in this contest. At Thorndale, Pa., and at Mt. Grove, Missouri, they are following their usual practice of leading all others. Perhaps he allowed his students to try their hand at picking out winners for this contest. Students pay Mr. Barron $500 a year for instruction, besides working on the plant. GEO. A. COSGROVE.

Roupy Fowls.

I have several fowls that have been affected with roup but are now free from all symptoms, after proper treatment. Would you let me know how long they should be kept before it would be well to kill them for eating? J. B. P.

New York.

If these fowls are in good flesh and free from all symptoms of disease, I know of no reason why they should not be eaten at any time, though one's natural "finickyness" would lead him to prefer that several weeks should elapse from the time of their recovery before they appeared upon the table. PUBLISHER'S DESK

We would like to have you give us a digest of the enclosed circular in THE R. N.-Y. An agent of this Farmer's Society of Equity was here, and I understand he got 23 members at $2.50 each. It is claimed that they can buy tools and other supplies cheaper and sell products higher by being members of the society. I held reserved comments until I saw the name of Jas. A. Everitt, and I did not then hesitate to tell my neighbors that it was the old game under a new name. I remembered that THE R. N.-Y. had published something about the Everitt schemes some time back. A. L. G.
Idaho.

We know little of this particular scheme, but we have known Jas. A. Everitt long enough to believe that he will profit personally by any scheme that he originates. Some years back he got some good, sincere men interested in the so-called American Society of Equity. Everitt's plan is to raise a calamity howl about things as they exist, and to promise a complete Utopia, if his scheme is adopted. The sincere men who went into the society soon conceived that Everitt was in it for his own profit, and, yet thinking the things he promised possible, they dropped Mr. Everitt. Now he is trying to work the scheme all over again with a new organization, or probably the old scheme under a new name. Our understanding of the situation is this: Mr. Everitt cannot afford to pay agents to solicit subscriptions for his cheap paper alone. In order to pay the agents he must have some other scheme on which to collect fees. The society scheme affords the opportunity. In the old scheme, Everitt too the subscription price of his paper out of the fee paid by the farmer. How much of the balance went to expense of agents and other organization expense we do not know; but we have never heard of any dividends to the man who put up the cash. There are varying degrees of schemes and schemers, but to the victim they all look alike.

Elmer E. Burlingame and James Dunlop Smith, who were found guilty New Year's Day of conspiracy to swindle investors in the stock of the Radio Wireless Telephone Company, were sentenced by Judge Hunt, in the Criminal Branch of the Federal District Court. Both were found guilty on two counts of the indictment. Smith, who had been president of the company, was sentenced to twenty-one months in the federal penitentiary at Atlanta and to pay a fine of $5,001, and Burlingame got two years and six months in the same institution and was fined $10,100. The Ellsworth Company, the stock selling concern was fined $10,500. The frauds ran into the millions and the prosecution of the defendants cost the government a large amount of money.

This is good as far as it goes; but we like the plan of issuing "fraud orders" better. The fraud order stops the mail of the schemers, and the fraud goes no further. By the criminal court plan the Government must let the rogues go on until they make a record, and then cause their arrest. By this plan the people lose their money, and at best have only the empty satisfaction of seeing the rogues go to jail. By all means let us have the "fraud orders" and stop the robbery of the people and the cost of litigation to the Government.

Aaron Kasofsky, proprietor of the Hudson Bay Fur Company, of 449 Washington Street, Boston, Mass., was recently found guilty of making untrue and misleading statements in his advertisements. He was placed on probation on the promise that he would change his style of advertising. The Hudson Bay Company is an old and well-known concern; and the Advertising Vigilance Association contended that the Hudson Bay Fur Company advertising gave the impression that it was the historic concern. The court took this view. Massachusetts has a law against fraudulent advertising, and this is one of the first convictions under this new law. A similar committee is at work in New York, and one conviction of a fur house has been already secured.

As you act in the role of detective for your unfortunate subscribers, I wish to ask you concerning the standing of E. F. McAvoy of Cambridge, N. Y., who claims to have a great stock-breeding farm there, and advertises an extra fine strain of Houdan fowls. "Faultless," he calls them, and trap-nested up to a record of 300 eggs a year and over. Is he a reliable man to deal with, and to be trusted in a business way? I have over $100 involved with him. J. E. M. G.
Dade Co., Fla.

E. F. McAvoy is regarded as the "horse gyp" of the poultry industry—he also represents himself as a breeder of Jersey cattle. Our reports on him show that he has no property in his own name, and judgments against him are uncollectable. He has been indicted in this State for fraudulent use of the mails, pleaded guilty before the Federal court at Utica, N. Y., on December 16 last, and was fined $750. Further detail of his record would seem to be superfluous.

I ordered a half dozen pairs of "guaranteed" hose from the Arrow Knit and Silk Works, 400 West 23rd street, New York. They sent the "guarantee" along with the hose. These hose went to the bad in a month's time. The material was very inferior, indeed. I returned three pairs of hose that were the worst worn along with nine cents postage for hose to be sent in return. I also enclosed the guarantee. I have never received my hose nor the money I sent for postage, although I have written them three times. Please tell me if they are considered reliable. Such firms should be exposed. No doubt they have treated others as they have treated me. MRS. L. W. A.
Ohio.

We were unable to get any redress from this firm. The amount is small, but the experience shows how worthless a guarantee may be if the house making it is not responsible or trustworthy.

Just for variety: Last August a case of eggs sent by express reached New York City in bad condition owing to breakage. There was some delay in getting details from consignee, and complaint was not sent until September. It was promptly acknowledged, and after about eight weeks a draft arrived for the full amount asked.
If you wish proof, here's a dollar of it for my subscription. J. A. H.
New Jersey.

The proof is entirely satisfactory. This is certainly a record for the express company. We only hope that they will make this record a rule of practice for the future.

I wish to inform you that I got a new bicycle from Adams Express Company in return for the one they lost in transit. I am perfectly satisfied with the manner in which they settled my claim. I am very grateful to you for your kind attentions to the matter. I am sending you a few new subscribers and intend to get you some more in the near future.
Connecticut. B. K.

Subscriber put in claim promptly for $36.40, the value of the bicycle which was lost in transit, but was unable to get any satisfaction and sent the claim to us. Settlement was finally made as above.

About the 14th of last April I very foolishly, and in the goodness of my easy heart, sold $61 worth of registered Berkshires to N. R. B. Goodman, Richland, Lebanon County, Pa., on his 60-day note. The note was due June 15, and was not paid. Now Goodman will not answer my letters. Do you know anything about him? Can you do anything for me?
Pennsylvania. W. F. M.

We were as unsuccessful in getting any reply from Mr. Goodman, and our attorney was unable to collect the account. Report is that Mr. Goodman has no property that can be attached, so that a judgment could not be collected. What property he has is in the name of his wife. Our attorney reports a judgment against him which he has had some time and is still unable to collect.

I have just received two issues of your paper on the the 10 weeks for 10 cents plan and would like to say don't discontinue when the 10 weeks are up. Keep it coming, sending me the bill before the last issue so I can get it continuously, as I like it. E. C. B.
Rhode Island.

This is the encouragement offered by our friends who send in the short term subscriptions. They renew and become friends of the paper. Most publishers who have tried short-term subscriptions, say they do not pay and give the plan up. A big selling organization with agents all over the country can sell any kind of a paper; but when a publisher depends largely on voluntary subscriptions, and the influence of old subscribers, the paper itself must appeal to the reader. We are glad to have the 10-weeks subscription for 10 cents, because while it costs more than 10 cents to fill the order the large percentage of renewals makes the first order profitable.

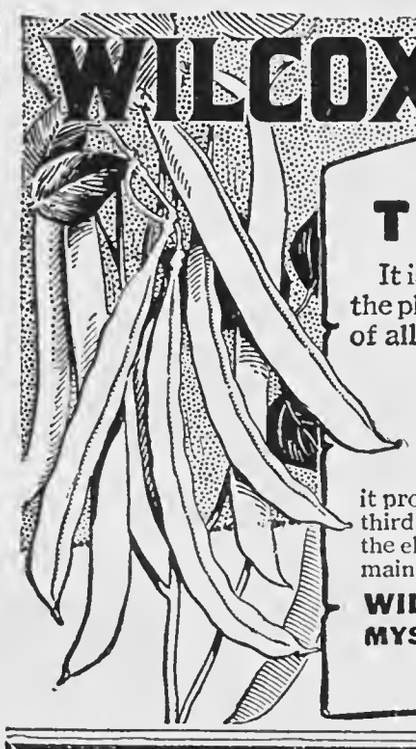
WILCOX FERTILIZERS



AVOID FERTILIZERS THAT IMPOVERISH

It is easy to compound a fertilizer that will push the plants rapidly out of the ground, and sap the earth of all those elements vital to future fertility.

WILCOX FERTILIZERS
"The Fertilizers that Fertilize"

are rich in all those elements that—first, promptly push the young shoot to the surface—second, sustain it properly till it matures, a perfect specimen of plant life—third, that leaves a margin of fertilizing materials to replace the elements drawn from the soil by the harvested crop, thus maintaining a yearly balance. Send today for our book.

THE CALIFORNIA EGG CONTEST.

The eleventh month of the Napa (Cal.) egg-laying contests just ending shows no marked changes in the relative positions of the leading pens. The pen of Buff Wyandottes, entered by the writer, still holds first place, with a total of 800 eggs; their nearest competitor being Blom & Son's White Leghorns, with a total of 758 eggs. Both of these pens made a poor showing for the past month, the Wyandottes laying only four eggs and the White Leghorns seven. All the other pens are so far behind that, barring accidents, they will finish as they now stand. Rutherford's White Rocks are fourth with a total of 704 eggs, having laid five the eleventh month. Lubben's Barred Rocks did well, laying 64 eggs, with a total of 718. Otten's White Leghorns laid nine, with a total of 692; Slocum's White Leghorns laid 32, with a total of 686; Clardy's Buff Orpingtons (from Missouri) laid 13, with a total of 613. These are the only pens that have laid over 600 eggs. Nine pens fell below the 400 mark. Two pens, both White Leghorns, laid no eggs the eleventh month.

There are several very good reasons for the comparatively poor showing being made in this contest; the principal one is that it was started fully three months too late. Nearly all of the fowls are past two years old; the leading pen of Buff Wyandottes are just passed two years, and been laying heavily before they ever saw Napa. In fact I picked one of them off the nest to put her in the shipping coop. If it is true that the first year of a hen's laying is her best, it would appear that this contest should have started in October instead the last of February, in order to give the test a fair one. The second reason is that the fowls have been moulting heavily and have not yet finished. Another reason is that this has been a most unfavorable year for egg production since the rains began. We have had heavy rains continuously weeks at a time, with heavy cold winds, and at the present writing the whole State is tied up for lack of railway transportation; every road in the State is suffering from washouts and landslides. All these unfavorable conditions has mitigated against any very high records. I understand the next Napa contest will not begin until next Fall; about the time the next Missouri contest starts.

Following are the 10 highest pens with their record to date:

1.—Pearson, Buff Wyandottes, 11th month 4; total 800.
2.—Blom & Son, White Leghorns, 11th month 7; total 758.
3.—Lubben, Barred Rocks, 11th month 64; total 718.
4.—Rutherford, White Rocks, 11th month 5; total 704.
5.—Otten, White Leghorns, 11th month 9; total 692.
6.—Slocum, White Leghorns, 11th month 32; total 686.
7.—Clardy, Buff Orpingtons, 11th month 13; total 613.
8.—Stice, Buff Leghorns, 11th month 16; total 593.
9.—Straun, White Leghorns, 11th month 24; total 580.
10.—Bunjes, White Leghorns, 11th month 4; total 562.

W. H. PEARSON.

Poor Laying.

Could you tell me what ails my chickens? I have 45 S. C. White Leghorns which will be two years old next April. All last Summer they averaged about two dozen eggs a day, then in the latter part of August they started to moult and of course stopped laying, but they are still moulting. Some of the hens have bright red combs, while others are pale and shrunken. I am only getting three and four eggs a day now. I keep them in A-shaped house with a cement floor. The house is 10 feet long and 10 feet wide. I am feeding according to the Cornell method. I should like to add ground oats and gluten to the mash. How much would it be advisable to put in of each?

Newfield, N. J. G. B. J.

Some of your hens are evidently a little slow in completing their moult, but this is no evidence of anything wrong; on the contrary, the late moulters are usually the best layers. You will not improve the Cornell ration by adding ground oats and gluten, though these are both good feeds. I would suggest, instead, feeding the oats whole if the hens will eat them readily. If you desire to use gluten feed, the following formula containing it has been recommended by the Maine Experiment Station, and is a good one: 100 pounds each of wheat bran, middlings, gluten feed, and cornmeal, to which is added 50 pounds of meat meal and one quart of fine salt. This formula contains one-ninth part of animal food, in the form of meat meal, while the Cornell formula contains one-fifth part of beef scrap, making the latter a more expensive ration, though possibly a somewhat superior one. M. B. D.

The FARMERS' BUREAU an agency exclusively for agricultural help. Only first class farm help and positions solicited. References investigated. Scientific advice on farm problems. Dept. R, 150 Nassau St., N. Y. Phone, 5565 Beekman

Subscribers Exchange

POSITION WANTED—General farming or dairying; married; age 35. W. R. CAMPBELL, Elizabethtown, Ky., Route 2.

POULTRYMAN desires position on poultry farm; experienced college trained; references. L. PETERSON, Linwood, N. Y.

YOUNG MAN, 19, with some experience, wishes position on farm. Address I. F., care Rural N.-Y., 333 West 30th St., New York.

MARRIED MAN to work on farm; general farming; fair horseman; must be strictly sober. WILFORD WOOD, 142 Court St., Brooklyn, N. Y.

WANTED—Single man, under 35, as herdsman; first-class dry-hand milker; conscientiously industrious; no cigarettes or booze; $35 a month and board. R. F. SHANNON, Sewickley, Pa.

WANTED—Single woman, general houseworker on farm; no outside work; reference given and required. 3 adults; five dollars a week. SIGNAL FARM, Camp Meeting Road, Sewickley, Pa.

TWO YOUNG MEN open for employment; life experience all branches of farming; would prefer working West; age 23 and 26; references furnished; state particulars first letter; business. J. H. F., care R. N.-Y., 333 West 30th St., New York.

POSITION WANTED as manager or farm superintendent of a gentleman's estate by a married man, 40 years of age; American; small family; thoroughly understands all branches of farming, handling and caring of stock, crop and soil, farm machinery, gas and kerosene engines, separators, butter making, incubators and brooders, caponizing and castrating, and a good knowledge of veterinary science; also fruits, vegetables, hardy shrubs, plants, road building, grading, etc. Best of reference as to character and ability. Address FARM SUPERINTENDENT, Box 35, Huntington, Long Island.

12-ACRE FRUIT FARM—7 acres grapes; other fruit, pasture; house, barn; $3,500. N. C. JACOBSEN, St. Joseph, Mich.

SALE OR RENT—25 acres, very productive; fruit garden; poultry farm; tools; furniture; on river, South Haven, Mich. CHILSON, 642 West 58th St., Chicago, Ill.

200-ACRE FARM FOR SALE OR RENT—Basement barns; 12-room house; 10 minutes walk to trolley; 30 minutes drive to Cortland; for full particulars address owner. OTIS TRIPP, Union St., Cortland, N. Y.

NEW ENGLAND DAIRYMEN—Buy of the producer. We have 200 tons Hay, Coarse Timothy, Fine Stock Hay and Swale. CHANDLER BROS., New Gloucester, Me.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

WANTED—Woman for general housework. Apply to N. M. KISTLER, Emporia, Va.

WANTED—Position as superintendent or foreman of farm by mature man of experience, ability and high-class reference. BOX 100, White Lake, N. Y.

1912 GRADUATE of New York State College of Agriculture desires responsible position; good references. W. N. J., care R. N.-Y., 333 West 30th St., New York.

YOUNG MAN—graduate of agricultural school, wishes a position on up-to-date poultry farm; previous experience; excellent references. Address F. S. W., care R. N.-Y., 333 West 30th St., New York.

POSITION WANTED—To take charge of a poultry plant; single; 35 years; thoroughly experienced with utility and exhibition stock; also understands general farming; state wages. B. J., care R. N.-Y., 333 West 30th St., New York.

ENGLISHWOMAN (31), 1½ years' experience on farm, seeks position to help in cooking, dairy work, or sewing, where she can learn gardening, care of poultry, etc.; clean home essential; references. Address MISS K. ANDREWS, Ap. 34, 507 West 111th St., New York City.

FARMER—A gentleman wishes to engage an experienced, married farmer for his place in Westchester County, N. Y. Apply by mail or personally, ROOM No. 1202, No. 82 Wall St., New York City, on Thursday, February 26, after 2 P. M.

WANTED—Married man by year for general farm work; wages $50 per month with house, natural gas, ice and water free; wife to board one or two men winter; several in summer. SUPERINTENDENT, care R. N.-Y., 333 West 30th St., New York.

EXPERIENCED AMERICAN desires position as working manager of fruit farm; mechanical ability and technical training; age 27; strictly temperate and honest; references; immediate liberty. PRACTICAL, care R. N.-Y., 333 West 30th St., New York.

ARE YOU INTERESTED in securing a practical, up-to-date farm manager? Twenty years' experience using practical, economical business methods. Not a theorist. One who knows how, why, and can produce results. References, bond. W. A. MAYOR, 332 Indiana Ave., Watertown, N. Y.

OUR GRADUATES will be ready to accept positions as dairymen, poultrymen, horticulturists and general farm help on March 1st, 1914. Applications will be considered in the order received. Address BARON DE HIRSCH AGRICULTURAL SCHOOL, Woodbine, N. J., Dept. B.

WANTED AT ONCE HERDSMAN—For a good, reliable married man will pay $50 a month with house; must be a good dry-hand milker; also kind to stock, and thoroughly understand dairying. State age, nationality, experience, habits and reference first letter. GEO. O. SEDGWICK, Foxburg, Pa.

EXPERT POULTRYMAN desires position as manager; scientific training and thoroughly practical; experience covers all lines, particularly commercial egg farming; young American, well educated; capable, energetic and honest; no tobacco or intoxicants; best of references; only first-class propositions considered. POULTRYMAN, Box H, Cazenovia, N. Y.

WANTED—Working foreman on truck farm; live man to help push the business; no cigarettes; married man preferred; board one or two men during busy season; ten acres strawberries and garden; poultry; reclaiming plot swamp land; market two miles; wages $300 per year plus 20 per cent. of net income; house, etc. RANSOM'S BERRY FARM, Carboudale, Pa.

WHO WANTS FRESH EGGS?—Quality guaranteed. Postal brings information. HOME FARM, Roxbury, N. Y.

HAY FOR SALE—A car of Timothy hay, baled, direct from grower; write for price. M. E. HINTON, Woodstock, Ohio.

FRUIT TREES TRIMMED by practical fruit grower and largest peach producer of Bergen County, N. J. Orchards planned and planted. Special rates for Winter contracts. H. W. COBB, Glen Rock Fruit Farms, Ridgewood, N. J.

MAPLE COVE FARM—Products direct to Consumers. ROUTE 24, Athens, Pa.

FARM FOR SALE—225 acres. Apply to OWNER, Box 337, Emporia, Va.

FOR SALE—Forty acres; ten acres in orchard; seven-room house, worth $2,500. Price, $3,000. HENRY VON HOLDT, Old Mission, Mich.

FOR SALE—100 acres with buildings on Cayuga Lake; station and switch on farm. E. G. BRADLEY, Aurora, N. Y.

FOR SALE—70 acres, rich land; town of 12,000 3½ miles; orchard 20 acres; good buildings and water. FRANK DIEHL, R 1, Staunton, Pa.

FARM FOR SALE—240 Acres; 60 in cultivation, balance in pasture and wood, some timber; good for 35 cows and team; fine place for Summer boarders; inquire of owners. PINKHAM & VARNEY, So. Strafford, Vt.

FOR SALE—Good 95-acre farm; mill and ice business combined; great cider and sawmill run by excellent waterpower privilege; 1¼ miles to cars, schools, etc.; nice town; good neighbors; 12 miles State road to Worcester; 5 miles Webster; $6,500; includes everything—farmhouse, barn, mill and machinery, waterpower; about 800 tons ice; $2,500 required. ERNEST HOWE, R.F.D., Oxford, Mass.

ONE OF THE BEST WESTERN NEW YORK Farms for Sale—80 acres under cultivation; 20 acres in timber; all level; rich loam suitable for all crops; living spring in pasture, and fine, never-failing well at house; 10-room house and large barn; both in good condition; near railway and Rochester-Geneva interurban line; 3½ miles from Clifton Springs; half mile from village of Orleans; owner unable to give proper care and will sell at attractive price; terms to suit purchaser. Address Rev. S. M. NEWLAND, Clifton Springs, N. Y.

Henderson's Tested Seeds

The firm of Peter Henderson & Co. was founded in 1847 and the 67 years of successful seed-raising and selling that is behind every package of Henderson's seeds must and does make them the best that it is possible to buy. In your grandfather's day, Henderson's was the standard by which other seeds were judged, and the same condition exists in 1914. Our methods of seed-testing, which were the best three generations ago, have been improved upon from year to year and are today still the best.

The unknown quantity in your garden is the quality of the seeds you plant, and you cannot be too careful in seeing that you obtain the best procurable. The most critical of all planters in the choice of their seeds are market-gardeners or truck-farmers. Perhaps the best endorsement of the quality of Henderson's seeds is the fact that Peter Henderson & Co. supply a larger number of professional growers than any two seed-houses in the world. The very existence of these men depends upon their receiving the best quality of seeds. That Peter Henderson & Co. are easily pre-eminent in the professional growing field is the best endorsement of Henderson's seeds that can be given. Henderson's seeds are tested seeds.

"Everything for the Garden" is the title of our annual catalogue. It is really a book of 208 pages, handsomely bound with a beautifully embossed cover, 14 colored plates and over 800 half tones, direct from photographs, showing actual results without exaggeration. It is a library of everything worth while, either in farm, garden or home.

A Remarkable Offer of Henderson's Specialties

To demonstrate the superiority of Henderson's Tested Seeds, we have made up a Henderson Collection, consisting of one packet each of the following six great specialties:

Ponderosa Tomato
Big Boston Lettuce
Henderson's Invincible Asters
Mammoth Butterfly Pansies
Giant Spencer Sweet Peas
White Tipped Scarlet Radish

In order to obtain the largest possible distribution for our annual catalogue **"Everything for the Garden,"** we make the following unusual offer: Mail us 10c and we will send you the catalogue, together with this remarkable **"Henderson's Specialty Collection."**

Peter Henderson & Co.,
35-37 Cortlandt Street, New York City

I enclose herewith 10c for which send catalogue and "Henderson's Specialty Collection," with complete cultural directions, including the "Henderson Garden Plans."

VOL. LXXIII., No. 4244. NEW YORK, FEBRUARY 28, 1914. WEEKLY $1.00 PER YEAR.

THE JOY OF YOUTH IS KEPT ALIVE BY THE ROSES.

LET FARMERS GET TOGETHER.

A recent editorial in THE R. N.-Y., speaking of Secretary of Agriculture Houston's recent comments on prices received for large versus small crops, has appealed to me strongly. There is no use disputing Secretary Houston's statements. He has the figures, and they are conclusive, neither is there any use of denying the position taken by the editor of THE R. N.-Y., but just what are we going to do about the whole matter? I have little sympathy for men who simply carry a grudge without making effort to correct existing evils, and really isn't the former method more characteristic of us farmers than the latter? Are we not more likely to grumble because everything is wrong than to make any particular effort to correct the wrong? It is true that the Granges by attempting coöperative buying have tried to benefit matters for farmers. For years there has been talk about coöperation in selling farm produce, but how much has the talk about this latter matter ever amounted to? I notice that Armour made 30 percent on his invested capital for the last year's business. Part of this certainly comes out of the producers, and 30 percent net is surely a good margin. The entire subject is a large one, and worthy of years of study by competent men. But is anybody really giving the matter any study at all?

What I would like to have the farmers think about a little is the enormous difference that there would be between the effort such as is being made by the Grange to buy things as cheap as possible, and a corresponding systematized effort to sell their farm produce as high as possible. Supposing, just for comparison's sake, that the average farm consists of 150 acres. Such a farm in our country will probably buy an average of $50 worth of seeds; $200 worth of clothing; $200 worth of groceries and $200 worth of hardware, machinery and so forth, a year, making a total of $650. Supposing that by using Grange methods a saving of seven percent is made on these purchases; this would amount to $45.50. Now this same farm will rent at cash for $1,125 today, and as we always figure labor to equal the cash rental value, the tenant would be compelled to get $2,250 out of the place in the way of crops sold before he could pay his labor and rental, while, as a matter of fact, he will do this much and lay aside a moderate amount in addition, so that we are probably not very far out of the way in saying that this farm will sell products worth very close to $3,000. If we are able by coöperative methods to add seven percent to the selling price of this produce, it would amount to $210 for the year, about four and one-half times as great a result as is possible to accomplish by purchasing at a discount. As a matter of fact, in my opinion, the difference would be much greater than this, because we have figured a uniform reduction of 7% on everything purchased, while we question if the most successful Granges have ever been able to accomplish this much or apply their methods to the entire list of commodities used, including the hardware, clothing and groceries. On the other hand, we believe, the cooperative selling might very easily bring in 10% more if properly handled, than we are likely to get without it. My idea of coöperative selling would be in the first place, to organize societies that handled just one article, say fruit, milk or any one of our farm crops. This sort of thing has already been done successfully where the producers are enough in earnest about it. Witness the great results accomplished in certain sections of the country by handling fruit coöperatively. My idea would be twofold, to have the association handling this produce not always try to figure the highest possible prices, but constantly to study the features and advise its members of best possible methods to be used in handling the produce and getting fancy prices; in other words, to teach the producers the necessary methods of producing the highest quality, marketing it in the most attractive packages possible and thus stimulating the market to the highest point. It is true that it would be necessary for many farms to coöperate in order to make this movement the most successful. On that account, it would be easier to have one association handle one thing, starting, say with milk and fruit, which are commodities very easily capable of being handled by association methods and in a successful manner. Then if such a movement were started, get a thoroughly capable man at the head of it and pay him a real good salary. It would be necessary to do this in order to make the project successful and would be one of the vital factors. The manager would need to have thorough training in business matters, as well as to be thoroughly conversant with the farmer's end. But such men could readily be found and it would be only taking a small amount from each member to pay him a sufficient salary to secure his service.

Ohio. CHAS. B. WING.

R. N.-Y.—We call Mr. Wing's attention to the paper by Mr. Tuckerman now being printed in THE R. N.-Y. See what was done in the Hudson Valley through coöperation! We shall report dozens of other societies. They are springing up everywhere.

FARMERS' WEEK AT CORNELL.

PART I.

"This is a fine afternoon; I am so glad that it is only three o'clock." I thought that it was a fearfully cold afternoon, for the mercury had tucked itself away under the cipher and was hiding there while icy winds swept the hill and drove all but the reddest-blooded indoors. There was evidently an enthusiasm abroad that defied the cold, however, and I looked around at the crowd pouring out of the new auditorium to see who it was that found the afternoon "fine," and was glad that it was only half over. It was one of a number of young women hurrying to reach another building and get seats before the speaker began. That talk wouldn't be given again, and if you were not there, you missed it, that's all. To be sure there were a score of other things that you wanted to hear, and see, all at the same hour, but having fixed upon this, there was nothing to do but to run for it. And, best of all the women were there, and they were all having such a good time, and they came very near to demonstrating that the foundation of the farm home is equally essential to the success of a farmers' meeting. Maybe it was a mistake; putting that new building devoted to the teaching of home economics so near to the agricultural building, and making a good walk between; still, the agricultural building was crowded too, and no one, whether he talked about raising buckwheat or spraying fruit trees, had any need to complain of the lack of an attentive and interested audience.

The experience meetings were not all held in the lecture rooms, either. Whenever you went, through corridors or into exhibit rooms, you would see groups of men, perhaps by themselves, or maybe gathered about some agricultural teacher whom they had recognized and "nailed" on the spot; and if you stopped to listen a moment, you would hear the jargon of agriculture. When men get together at times like this to discuss those things in which all are interested, all are neighbors; and no one hesitates to break into any group talking about something in which he is interested to contribute his mite, or draw a little more out of some one already there.

They make pleasant discoveries in this way, too. That quiet spoken, pleasant-appearing man, looking at that exhibit of potatoes and chatting with those about him, is Martin, the drainage expert. You have read about some of the things that he has done, and it does you a lot of good to get next to him and absorb a little of his personality. When you read about any of his work again, you will feel acquainted with him. That man over there explaining some things about bee keeping to an interested group is House; and that man hurrying through the corridor, stopping only to greet an acquaintance with a smile and impart a little of his contagious enthusiasm, is Rice; you have read about Rice; he invented hens. A lot of these men whom you have read about, or heard about, for years, and who have sort of grown to the proportions of giants in your mind, prove to be just common, whole-souled, neighborly men when you get next to them at a place like this. A college professor has always been a rather awe-inspiring thing to most of us, but when you get close enough to one to look him in the eye and listen to his voice, you find that he is only a pretty good quality of clay, after all, and when you get a little better acquainted with him, you don't mind calling him brother.

M. B. D.

THE STORY OF A CO-OPERATIVE SUCCESS.

PART III.

FUTURE POSSIBILITIES.—And we are looking ahead to the time when we can use our Exchange for much wider purposes than now. We see no reason why we should not have our own fertilizer plants, as the Monmouth County Exchange in New Jersey has; our own package factories, canning factories, cold storage, etc. We would have our own fruit trains to New York now if there were room in the Weehawken yards to unload. But there we are up against the milk trains of the West Shore, O. & W. and Ulster & Delaware roads on one side and the trackage of the National Express Company on the other. But we shall work that out in time. Now we are obliged to ship by express unless we want to risk the delays of boats at about the same rates.

FIGHTING OPPOSITION.—At the meeting of this society last year, reference was made to a cement deal where a concern, after selling direct to farmers, found a combination of dealers against it in that district, and the claim was made that much business was lost thereby. That is purely an economic matter. If that concern was selling satisfactory cement direct to one group of men, it is more than likely that others in the same neighborhood would quickly avail themselves of the opportunity, and the company would find that its business tended to grow, in spite of opposition by the dealers. Opposition to our Exchange has stopped at nothing so far in the effort to put us out of business, but we notice that concerns having fertilizer, feed, etc., to sell seem very anxious to deal with us, and now even outside commission men are applying for appointment by us, where at the start they scoffed.

IMPROVING CREDIT.—But further still than this: We all know that the farmer has had to pay seven and eight per cent. and more for money in the past. Each of you doubtless know of men in your community who have made fortunes lending money to farmers on mortgages, usually at the highest rate that they were able to squeeze, and you all know of good, industrious neighbors who have been forced out because they could not meet short term notes. No other business in the world has better security than we have, and none other has so much trouble getting money on terms to enable us to make permanent advance. Now, we suddenly found when our Exchange wanted to buy stuff by the carload, that our notes were welcome at the banks. As one banker, who knew all about our little $500, said to me, when I wanted $1,500 for the Exchange: "Why sure, and as much more as you need." It was our joint credit he was sure of. And it is that joint credit that has made possible the really tremendous business we have done. Why not go a step further in coöperation, and use that joint credit which hitherto has lain idle and gone to waste?

NEW YORK STATE GRANGE.

PART II.

The matter of the use of traction engines on highways came up for consideration, and action favorable to the contention of the Brotherhood of Thrashermen that traction engines used by thrashermen should virtually be exempt from the rules and regulations recently made by the Highways Department, was taken. They asked that traction engines of the same style as those now in use "may be used for thrashing and other agricultural purposes" on the highways. It was stated that the amount of money invested in traction engines used in the State is more than $5,000,000, and that other machinery such as thrashing machines, separators, clover hullers, etc., to the value of $5,000,000 more would be rendered useless while the engines were being remodeled to conform to the rules of the department.

Two or three resolutions concerning plans for coöperative buying and selling came before the committee on coöperation, but did not find favor with the Grange when the delegates were called upon to act on them. One of these provided for the creation of a State Patrons' Produce Association, the members thereof to come from the Pomona Granges of the State. Another asked for the appointment of a supervisor of coöperative societies who should also give instruction in any matters pertaining to coöperation, and whose salary should be not more than $4,000. Neither met with favor. The idea of establishing a Bureau of Markets in connection with the Pomona Granges of the State also failed to carry.

The best method to deal with some propositions is to ridicule them, and this was neatly done regarding the so-called veal law now before Congress, which declares that no veal calf under seven years of age shall be killed, etc. The committee on trusts hadn't much to do this year, so it produced a resolution "making it a misdemeanor for any person to offer for sale any chicken less than eight, any fowl less than 15, any goose less than 25, any beef cattle less than 20, any hog less than 18, any sheep less than 15 and any eggs less than three years old." The Grange "adopted" the report with all the dignity at command at the time, which wasn't much.

To probibit the manufacture and sale of all malt and spirituous liquors by a constitutional amendment in 1916; opposing the Congressional free seed distribution; recommending the continuation of Grange scholarships; amending the drainage laws so that the owner of low, wet land, capable of improvement by draining through adjacent lands may have the right to do so without long and expensive proceedings; favoring a constitutional amendment permitting women to vote; favoring the use of school houses as social centres for the community; favoring the loaning by the Federal government of the deposits of the postal savings banks directly to farmers at the same rate of interest as to National banks; opposing the resolution to establish a permanent home for the State Grange as headquarters and place for annual meeting; favoring a system of unification of agricultural education; asking legislation to preclude brokers in farm lands from accepting a commission on sales unless there is a written contract with the owners; asking for an increase of jurors' fees in justices' courts from 25 cents to $2 per day; asking for a censorship of popular songs offered for sale to cut out those immoral or suggestive; favoring a county option bill to control the liquor traffic by counties; approving a fine of $25 for Sunday hunters; advocating the appropriation of moneys by the State for new buildings at the Geneva Experiment Station; commending Gov. Glynn for his interest in agricultural legislation and the farmer's behalf; demanding that the State pay for all cattle killed by its agents; better market roads.

J. M. DARROW.

HOMEMADE LIME-SULPHUR.

Many readers are asking us how to make the concentrated lime-sulphur at home. So much has been said about this in times past, and the experiment stations have also printed so much on the subject, that the great majority of fruit growers understand the subject well. There are others, however, who evidently have not studied it out thoroughly.

The demand is for a small apparatus for cooking the lime-sulphur with steam. One of the best bulletins on the subject is No. 201 from the Virginia Station at Blacksburg. From that bulletin we take the picture shown at Fig. 95. This shows a small steam boiler or feed cooker, costing about $40. The pipes are arranged as shown in the picture, admitting the steam into two barrels. With this outfit the bulletin states that one man could make five barrels of the concentrated solution in a day. Scraps and odds and ends of wood may be used as fuel.

Another arrangement for cooking is shown at Fig. 94. There is a small steam boiler about the price of the other. A platform strong enough to hold up the barrels is made as shown. In this case two barrels of the mixture are kept boiling while two barrels are being prepared. The pump shown in the corner is used for pumping water from the spring or well. The bulletin states that one man can use this outfit to prepare 250 gallons of the concentrated solution in ten hours. The barrels are fitted with a faucet so that when the lime-sulphur is used, it may be turned out into the trough directly into the tank from the wagon. This apparatus is within the reach of those fruit growers who have a large amount of spraying to do, and would probably fill the bill.

A good description of the method of making the lime-sulphur is given in Bulletin No. 330 of the Geneva, New York Station. The following statement being taken from that bulletin:

In making lime-sulphur wash, whatever the formula, only fresh, lump-lime should be used that is free from dust, grit, air-slaked material and magnesium oxide. It should not contain less than 90 per cent pure calcium oxide. The Station has a list, which will be sent on application, of those dealers who will furnish guaranteed lime of satisfactory quality. Local lime is sometimes satisfactory, but orchardists should be sure of the quality of the lime before attempting to make large quantities of the wash. For sulphur, light and heavy sulphur flour, flowers of sulphur, "ground brimstone" or "commercial sulphur flour" if finely ground and bolted, will do equally well. Before adding to the mixtures the sulphur must be thoroughly moistened and made into an even, fluid paste without lumps.

In making, slake the lime in about 10 gallons of hot water, adding the lumps of lime gradually to avoid too violent boiling and spilling over. Pour in the sulphur paste gradually during the slaking, stirring constantly to prevent the formation of lumps, and when the slaking has finished add the full amount of water and boil gently for one hour. If kettles and fire are used, more than the required amount of water may be used at first, to compensate for evaporation, or the volume may be kept constant by adding successive small quantities to hold the mixture at the original level as shown by a notch on a stick resting on the bottom of the kettle and marked when the mixture first begins to boil. When boiling with live steam the mixture will be more likely to increase in volume than to decrease, so that no water need be added. This concentrate will keep with little change, unless the weather is below 5 deg. Fahr., if stored in filled, stoppered barrels. Even in open receptacles there will be no loss if the surface be covered by a layer of oil to prevent access of air. Each boiling should be tested with a Beaumé hydrometer and its density marked on the barrels or other containers.

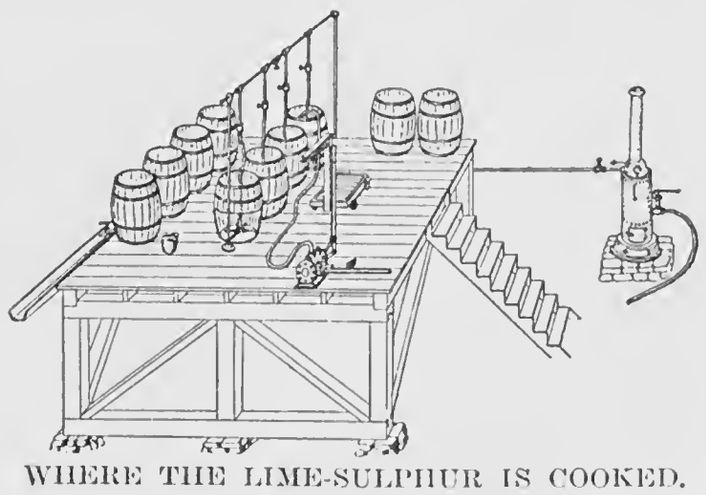
Of course care and skill are required to do the work properly. This can only be acquired by experience. As to whether it pays to manufacture the lime-sulphur or buy it is largely a matter of individual figuring. It is not unlike the problem of mixing fertilizers or buying the ready mixed goods. One man will demonstrate clearly both by his figures and his test of the material that the home making and home boiling pay him well, while another man almost in the same neighborhood would give up the home manufacturing after one or two trials, convinced that it pays him better to buy the mixed goods.

GROWING PEAS FOR THE CANNERY.

Experience of a Practical Farmer.

If conditions are favorable, growing peas for the cannery is one of the most profitable operations for the farm—as the returns are large for the amount of labor expended and the operation is an economical one. The roots of the pea vines contain a large amount of nitrogen, which is confined in small nodules on the roots of the plant, and after the crop has been harvested, these are plowed under, adding humus as well as nitrogen to the soil, thereby bringing up the land in a remarkable degree and at a minimum of expense. Pea growing can be conducted advantageously only where the conditions are favorable—one of the most important factors is that the cannery is nearby, the distance not to exceed four miles—other essential factors are latitude, altitude, climate, contour of the land, soil and amount of rainfall.

My farm located in Madison Co., N. Y., is situated on a ridge, with a gradual slope to the east; elevation is 1,400 feet above sea level; the seasons are short and the nights cool; often having hard frost in early June. In season of drought we do not suffer as much as other sections further east, and judge that this is partly due to the quality of the soil, and also that we are blessed with more rain at certain seasons. The soil is a good clay and readily worked under favorable conditions, so that

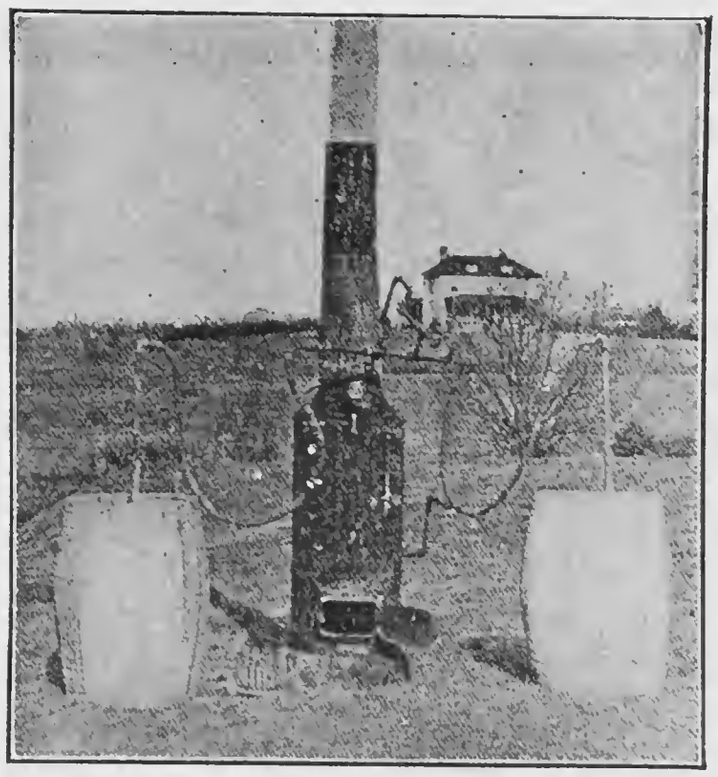


WHERE THE LIME-SULPHUR IS COOKED.
Fig. 94.

it is pliable and mellow. My contract with the cannery in 1913 was for 12 acres of peas, five acres Alaskas, two Advancers, five Market Garden, early, medium and late. The ground we took had been used as pasture for two years. It was plowed in April; then disked and harrowed so the soil was fine and mellow; and as far as possible all stones removed, these points being most essential for a successful pea crop. The peas were drilled in the latter part of April and the first of May, using four bushels to the acre, and 250 pounds fertilizer (1-10-5) to the acre.

There is no further work until it comes time to harvest, that is if the ground is free from weeds; if one is unfortunate there may be mustard to contend with, which is about the only enemy the pea has. This can be easily eradicated by spraying with copper sulphate or iron sulphate.

The Alaskas (early) take from 50 to 60 days to come to maturity. We are kept advised by the foreman of the cannery when to cut the crop, and this is done by mowing machines. The vines are put on the hay wagons and delivered to the factory. The labor required for this was three teams and five men; one man to a team and two men in the field, this takes care of the situation nicely. It is not advisable to cut the peas too long in advance, so one man cuts with the mowing machine while the other two teams load and haul to the factory. If the man with the mowing machine has a fair start, the teams will be kept busy and there is no waste of labor. Special guards are obtainable for use on the mowing machine, which lift the vines while being cut, which facilitates cutting and is economical. If the farmer so desires he can take



PLANT FOR FEED OR SPRAY COOKING.
Fig. 95.

his pea vines back with him after they have been thrashed, this making excellent feed for the cows. However, the teamster is generally rushed and does not care to do this. The pea vines are run on conveyors to the silos nearby, which are filled, making splendid silage, which is sold later in the Winter by the cannery at a retail price of $3 per ton. Pea vine silage, which is high in protein, will nearly double the yield of milk. The farmers are beginning to learn its value and each year the demand for it is increasing.

The peas are graded at the cannery into five sizes, and if the largest shall be tender and juicy and not inclined to split, are paid for at the rate of three cents per pound. Should there be hard peas in the largest size the grading is reduced to medium quality, which brings two cents per pound.

Below is actual cost of crop and receipts:

RECEIPTS.

5 acres Alaska (early) 20 loads averaging 788 lbs., about ½ medium, 2½c, fancy 3c	$399.61
2 acres Advancers (medium) 5 loads averaging 463 lbs., fancy 3c	69.39
5 acres Market Garden (late) 20 loads averaging 861 lbs., fancy	517.02
	$986.02

COST.

8 days team plowing 4.50	$ 36.00
8 days team harrowing	36.00
Hired team	31.50
Hired man	11.84
Farmer's time	24.00
Farm team hauling	34.00
Cost of pea seed	172.80
3100 lbs. fertilizer, 1-10-5	41.85
	$387.99

Receipts	$986.02
Total cost	387.99
Balance	$598.03

MRS. HENRY BURDEN.

THE NEW CURRENCY LAW.

PART III.

ELASTIC CURRENCY.—When there is a call for a large amount of money to move the crops the large volume of loans to the farmers and buyers of produce will be used to increase the volume of money in circulation. When these loans are paid the Federal notes will be retired. The new system embodies some of the views of the extreme radicals of the past. What was considered radical a few years ago is considered very conservative now. The present national banking law has been in force for 50 years. It was enacted at the close of the Civil War. The basis of the national bank notes is the National debt. The national banks purchase government bonds and deposit them with the government and receive national bank notes for circulation. That system limits our money supply to the amount of our national debt. The national debt is now about $2,000,000,000 and has remained nearly constant for 20 years because it was thought necessary as a basis of our money. Under the new Federal law we are not limited to government bonds as a basis for our money in circulation and we can proceed to reduce our national debt and stop paying useless interest charges. That would seem to have been the sensible plan for years, but some one or some element of our body politic has pursuaded us to the contrary all these years. During these 50 years we have had no less than five panics with their great loss of property.

LOANS ON FARM LANDS.—Any member bank may make a limited amount of loans on improved and unencumbered farms at half their actual value on five years time. This provision of the law together with the six months' provision for short time loans on farm products, or on proposed farm operations, ought to benefit farmers. In some sections of the country as high as 15% is charged farmers for these accommodations. The law will tend to lower interest rates.

BANK RESERVES.—The vital feature of the law is the provision regarding reserves. Under the national banking law the money of the country is drained to the cities, and in turn goes to New York City for Wall Street speculation, and when needed for legitimate business it cannot be had; $240,000,000 of bank reserves were in the maelstrom of Wall Street on November 24, 1912. The last panic was a bank panic. When the Federal Reserve Bank is established in any district each member bank is required to maintain reserves. A bank in a reserve city must have reserves of 15% of its demand deposits and 5% of its time deposits; a bank in a central reserve city shall maintain a reserve of 18% on demand deposits and 5% on time deposits; a bank not in a reserve nor a central reserve city shall hold reserves of 12% for demand deposits and 5% for time deposits. About half of these reserves must be in the bank's own vaults, and the balance in the district Federal reserve bank. *It cannot be drained off to the Wall Street banks. It must be retained in its own district.* This provision is perhaps the best provision of the law. Other provisions also are aimed to put an end to speculative gambling in stocks. The legitimate business of the country is to be provided with the means of exchange. The business interests of the country are optimistic and hopeful for prosperity for the many instead of the few.

Spring Seeding of Clover.

In replying to F. G., Mount Holly, N. J., in Hope Farm Notes, page 118, you speak of Spring seeding with Red and Alsike clover land sown to Winter rye. At what time in the Spring would you advise such seeding in Maine and how would you work in the clover seed, or would you leave it for the frost to work in? We have a piece of land sown to rye for Summer silage, and if practicable would like to seed it in the Spring rather than plow it again after the rye is taken off. I am planning to top-dress the rye with commercial fertilizer as soon as the snow goes off, so the land ought to be in good condition for clover and grass.

Manchester, Me. C. S. P.

We should sow the seed after the frost is out of the ground, but when the weather is still cold enough to freeze the upper surface of the soil at night. Our plan is to scatter the seed on this frozen ground in the early morning at such seasons. The ground is then full of little cracks. The clover seed will drop and roll into these cracks, and as the ground thaws the cracks will be filled, and the seed covered. Freezing and thawing in this plan for a few times will put the seed where it ought to be. Some farmers prefer to run over the ground with a light harrow or weeder, covering the seed in this way, and also cultivating the grain. In our own case this method of seeding on frozen ground has given a good stand, when the soil is right, and contains a reasonable amount of lime.

Saving Liquid Manure.

What is the best way to obtain the full fertilizing value of chamber slops for a small garden? S. R.

Use some "carrier" that will hold the liquids until wanted, or pour directly upon garden or lawn. In some cases these liquids are collected, diluted with equal parts of water and sprinkled over the lawn, or poured along the garden rows, during growth. For Winter use or while crops are not growing the liquids may be poured on sawdust, dry peat or muck, dry horse manure, or sifted coal ashes. The object is to have these liquids absorbed by some material which will hold them. If kept in a dry place the water of these liquids will mostly evaporate while the actual plant food will be held by the absorbent. This is called a "carrier," for when it is broadcast over the soil in Spring it carries the plant food with it. These liquids contain about 12 pounds of nitrogen in a ton, with small quantities of potash and phosphoric acid. A 50-gallon barrel of the liquid will carry about 2½ pounds of nitrogen, or about the same as 15 pounds of nitrate of soda dissolved in a barrel of water.

2. There are special mixtures of grass for light sandy soils, put up by nearly all the large seed houses. This mixture has proven quite successful in the seashore districts and will no doubt do quite well on your soil. Old well-rotted manure is the best fertilizing material for newly-made lawns; it should be quite firm and worked into the soil two or three inches deep. Fine bone meal applied as a top-dressing comes next. Use about five pounds to the square rod. Of this grass seed mixture, sow one quart to every 100 square feet (10x10). Rake in lightly and roll with a hand roller. K.

Soluble Chemicals in Illinois.

I have a piece of bottom land that is overflowed nearly every year. It is very fertile, but makes more stalk than corn. It should produce at least 80 to 90 bushels of corn in a favorable season. I want to see just what I can raise per acre on that land this season. It is clear of trash, stalks, and was plowed last Fall. It has been in corn for 30 years, no other crop. What fertilizer would you use, and how would you go to work to get 100 bushels of corn on that land per acre? I believe it can be done and am willing to do the work, but wish to use every means possible to secure that number of bushels, if the season is favorable. What do you suggest? E. T. F.

Belleville, Ill.

On the Atlantic coast the handling of such a piece of ground would be about as follows: We should assume that the heavy growth of stalk indicated a large quantity of available nitrogen in the soil. Such a condition would naturally induce a rank, heavy growth of stalk and late maturity, so that the ear and grain might not reach full development through the ordinary season. To remedy this we should use chemicals—available forms of phosphoric acid and potash. We should fit the land as well as possible, according to the needs of that soil and locality. Drill into each acre at the time of planting 300 pounds of acid phosphate, and 100 pounds of muriate of potash. This supply of available mineral plant food will make a "balance" for the extra nitrogen, and induce the ear and the grain to make a quicker and more solid maturity. The handling of the crop will depend upon the conditions, which Western farmers fully understand, but the adding of this available plant food is the proper treatment for increasing and developing the growth of the ear.

Reseeding Grass in Spring.

In August and early September, 1913, I turned under 10 acres of sod. I applied one ton stone lime per acre, which, when slaked with water, made three loads. This I harrowed in. The delay in procuring lime brought the seeding somewhat late. The last day of September I sowed one-half bushel of Timothy and a small quantity of Alsike clover per acre. It showed very little top. It is my intention to go over the ground in March with half that quantity of seed, and a little later apply 100 pounds of nitrate of soda per acre. Will the nitrate be injurious to the seed sown in Spring? What should I add to the nitrate for my grass crop? This field has been kept in meadow for 20 years. Of late I have been obliged to reseed every three years.

Ulster Co., N. Y. J. D.

Probably the grass seed will make a better showing when Spring opens. We have frequently had this experience. The seed was scattering in the Fall, but in the Spring it thickened up and made a good stand. Your plan of reseeding in Spring will answer, but we should work the ground thoroughly after the seeding with a very light harrow or a weeder, so as to scratch over the ground lightly. We should use 100 pounds of nitrate of soda, which will help to start the grass. We should mix this amount of nitrate with three or four times its bulk of sifted coal ashes or dry black soil. Mix it thoroughly, and by sowing the larger amount you will get a more even distribution of nitrate. A combination of chemicals frequently used by hay farmers near the large cities is of equal parts nitrate of soda, finely ground bone and muriate of potash, 400 or more pounds per acre. This is an expensive mixture but will surely make the grass grow. We could hardly advise in large quantities except when hay sells at $16 a ton or more.

AN attorney was cross-examining a witness. "You say you left Boston on the sixteenth?" queried the lawyer. "Yes, sir," replied the witness. "And returned on the twenty-eighth?" "Yes, sir." "What were you doing in the interim?" "I never was in such a place," she replied indignantly, with heightened color. —Credit Lost.

Apple Trees from Fraser Save Money for the Planter

My Apple trees are extra good—the one-year trees are as big as most two-year stock. My trees are hardy, clean, free from disease and scale. Raised in New York's great fruit belt for fruit-growers everywhere. Get my 1914 Book About Trees (it's free) and learn why my trees are better than others.

WESTERN NEW YORK HORTICULTURAL SOCIETY.

PART II.

Dr. Jordan, the director of the New York Experiment Station, who after looking the big audience over, said he "wondered that farmers could stand so much science," confined his talk mostly to the high cost of living and its causes. Evidently he is not very sanguine about the efficacy of the many cures suggested, especially that of increasing the yields of our products. It is true that there is a chance to increase the yields per acre, which are often low; true that the home supply has not been keeping up with the increased demand; true that the aggregate increase of farm products has been only very slight during the past decade, and that in some cases there has been a decrease; true that the figures representing production are entirely out of harmony with our increased population. It is also true that an immense acreage of tillable land remains unused, only 27 per cent of the potentially tillable land in the country at large, and about 40 per cent of such land in New York State, now being kept under cultivation. Our vast potential resources will only be developed, however, when it can be done with a profit to the producer. Our life habits have become expensive. The producer must secure a profit on his labor and investments. The profits in farming are not too large, and at present do not warrant an increase of production. Other conditions must change to stimulate greater production. No use in making two blades of grass grow where only one grew before unless the extra blade of grass can be marketed at a profit. The consumer pays enough, but the distribution of his money is on an entirely wrong basis. The price received by the producer grows about from 100 to 400 when it gets to the consumer. Only about 40 per cent. of the returns go to the producer. Farmers are not in control of their business. The goods, fruits included, are not standardized. Farmers compete with one another, and are always ready to break loose from a common understanding as to prices and sales. Fertilizers are mostly secured on credit at large increase of cost. Dr. Jordan seems to see little promise in State help, and in legislation, and is not clamoring for having the farmer made the pet of the State, and for supplying him with artificial and more favorable conditions than are the lot of other classes of our people. Self-help is the keynote of his suggestions as to the proper cure. Farmers must acquire the spirit of coöperation. If the State supplies instructors to farmers to help them organize for such purposes, these instructors should be well-trained men, and men of practical experience. The reorganization of the distribution of products and that of returns is sorely needed. Mr. George T. Powell also offered some suggestions along coöperative lines. Mr. Bush of Morton, speaking on the same question, remarked that high prices do not help the farmer because he does not get them. Higher prices therefore will not stimulate production unless part of the profits go to the producer. The elimination of needless expenses in distribution is the first necessity. When the farmer and fruit grower are happy and prosperous, this condition is reflected in every other business, and the whole people are prosperous. With all the great advantages in favor of the New York fruit growers, the latter have been asleep, with dormant courage and effort. The consumer is obliged to pay for his fruit with a standard dollar. He is entitled to a standard package. Speculators are usually around when not needed, and absent when market conditions are unfavorable. They are not to be depended on, nor to be waited for. New York offers the finest field for coöperation of any State in the Union.

Mr. A. J. Warren, an Irondequoit market gardener, speaking about growing vegetables under glass, remarked that the greenhouse is now an essential asset of the market gardener. Vegetables the year around are now considered a necessity, not any more, like formerly, a luxury. Among vegetables grown under glass we have principally lettuce, radishes, parsley, tomatoes, rhubarb, also green onions, cauliflowers, string beans, etc. The houses should be well glazed and protected. Many troubles are due to much exposed houses.

The question box always elicits lively and general discussions, but the "professors" are called on in most cases to give the final answer, or to "clinch the nail."

"What is the remedy for yellow leaf on sour cherries in June?" The expert answer gave the cause as being a fungus that enters three weeks before the trouble appears in the yellowing of the leaf. The first spray, Bordeaux mixture, must be applied before there is any sign of yellowing, and followed by two later applications.

"What to do with Early Richmond, Montmorency and English Morello cherries planted 16 by 16, and commencing to crowd?" Prof. Hedrick says the only thing that can be done is to cut some of the trees out.

According to Prof. Parrott digging out is yet the best remedy for the peach borer. Go after the borer with a chisel or sharp knife.

"Any danger of planting too many sour cherries in this part of the State?" Growers of experience seem to think there is some danger. Schmidt's Bigarreau cherry was pronounced a great and promising cherry by Mr. McKay, and as doing well on stony soil, by Prof. Hedrick.

"Will a few colonies of bees placed in a twenty-acre orchard help fertilize the bloom?" Yes, says Prof. Beach, the practise is on safe lines. It may do a good deal of good in some seasons.

Spraying with black-leaf tobacco extract for aphis when here, is all right, says Prof. Parrott, but kerosene emulsion, soap emulsion, etc., are cheaper. No dust spray can be used effectively for San José scale, says Prof. Parrott.

Prof. Hedrick does not think we are using enough cover crops in our peach orchards. Might safely use cover crops much more freely to advantage. Among best crops to be planted in a young peach orchard are named strawberries, tomatoes, cabbage, sweet corn, beans, peas, cantaloupes, squash, etc. The general opinion of fruit growers is that we now have enough crab apples in the State.

When fruit is wanted rather than wood growth on Bartlett pear trees, Prof. Beach recommends pruning after the leaves are well developed or are nearing the mature stage. The tree's energy will then be expended in developing fruit buds.

The fruit-tree leaf-roller is a new pest in this State, as stated by Prof. Parrott. He recommends the use of miscible oils to the swelling buds, and says he has destroyed by this means 93 to 97 per cent of the insects.

The old much-maligned Kieffer pear seems to be still thought worth planting by the majority of the members.

For putting in boxes rather than barrels, all apples of high flavor are recommended, such as Jonathan, McIntosh, Spy, Winter Banana, Canada Red. Prof. Beach says that some growers would even make money by packing good Rhode Island Greenings, or any other good apple. Lots of people would buy a box, when they could not buy a barrel. The majority of the members are also in favor of interplanting a young vineyard for the first two years with a cultivated crop, such as tomatoes or potatoes, but Prof. Hedrick qualifies this by adding "unless one has lots of land."

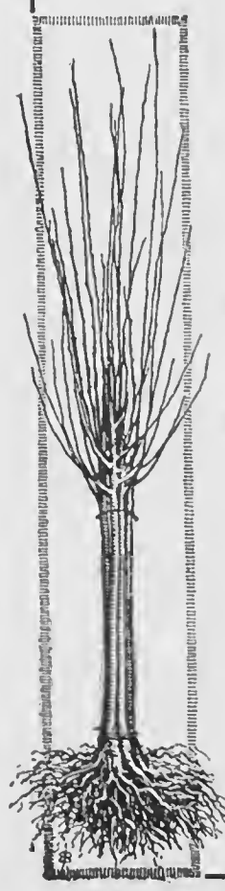
Black-leaf tobacco-extract if brought in contact with the human flesh may cause sickness. In the factories where employees sometimes become affected by nausea, drinking hot water is found to be the best remedy.

President Barry complained that while prizes had been offered for the best package of Baldwin and Spy apples (one, the first, of $25, and a second for $12.50) there were only two entries. There should have been at least 25. This does not show well for the enterprise of the members of the society. T. G.

EXPLOSIONS BY WIRELESS.

Experiments have been reported from Italy where mines have been exploded under the water by a wireless apparatus. It appears that the explosives were put down under water at a distance of about half a mile from the apparatus. There was a hill covered with trees, some stone and buildings between the two. Yet it was possible at this distance to explode the mine. It is a great thought as to what this may lead to in war. It is not at all improbable that a future development of this system would enable an apparatus on shore to explode the magazines in warships or destroy them with their own ammunition. That ought to be a fearful argument against war.

The GOOD Apple Trees For Northern Planting



are not grown in the north or west. They are grown on the "Eastern Shore" of Maryland, near the Atlantic Ocean, at Berlin.

These trees are tempered to entire hardiness for any apple section by the severe winter storms that sweep the coast from the north.

We sell only the trees we grow. Most of them are budded from bearing orchards. They are grown in the largest nurseries in the world, where more practical orchard men are employed than in any other nursery in America.

Get Our 1914 Catalogue

It tells why our trees are seldom equaled, and tells how to plant to get $100 or more an acre each year from your orchard. This book describes the valuable varieties of all fruits for all sections. Sent on request. *Write today, ask questions, and tell us about your planting plans and aims.*

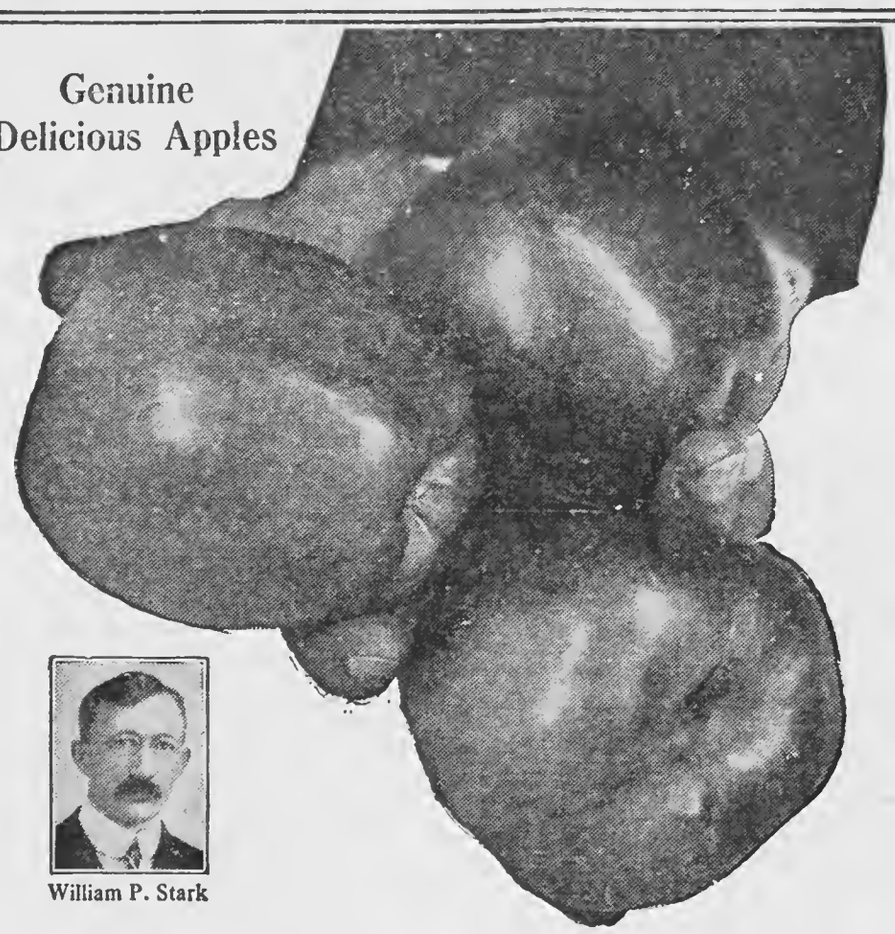
Genuine Delicious Apples



William P. Stark

Rush Your Orders for

Delicious Apple and J. H. Hale Peach

Each the greatest fruit of its kind. Each genuine, pure-strain stock. Send orders now direct to William P, Stark Nurseries, Stark City, Missouri, and get started this very spring with these premier profit producers.

The William P. Stark "Direct-to-You" Plan Saves You 30% to 50% on Finest Trees

We have eliminated all agents, salesmen and plate-book men. Our experience has been that by selling direct we can save our customers from one-third to one-half and be sure they get exactly what they ordered. Our catalog is our only salesman. Instead of paying agents' commissions and expenses you put the saving in your own pocket. And you get highest-standard, healthy, vigorous trees, *doubly guaranteed* true to name and free from insects or disease.

Selected 1 and 2 Year Delicious

The Delicious apple makes growers more and bigger profits than any other apple ever planted. In the Chicago commission markets in January, Delicious apples were bringing $3.25 to $3.75 per box—while Winesaps, McIntosh Reds, Winter Pearmains, Jonathans and Rome Beauties were priced at $2.25 to $2.75. You can get genuine Delicious apple trees of guaranteed purity, from William P. Stark Nurseries at grower's wholesale prices.

J. H. Hale Peach—Not Many Left

This year, as last year, we will be oversold on J. H. Hale peach trees in the middle of the season. This is the "Peach King's" master-piece. A peach larger, finer colored, better flavored, better keeper and shipper than any Elberta that ever grew. All J. H. Hale peach trees propagated from buds cut by Mr. Hale from his bearing orchards. Write or telegraph to be sure of getting enough trees for this spring's planting. The supply is short.

By Parcel Post

We furnish special grade, heavy, stocky plants and trees of mailing size in our parcel post department. If you want few trees or many see the Parcel Post assortments in catalog. We pay postage.

William P. Stark Trees From Stark City, Mo.

Remember the name—*Stark City, Missouri*. It means the famous Stark-Ozark Mountain grown quality—the 30% to 50% saving, the double true-to-name guarantee, the most expert packing and shipping. It will pay you to trade with the William P. Stark Nurseries.

46 Wall St., Rochester, N. Y.

Cut flowers are in demand everywhere, all the time. Flowers raised from bulbs grow quickest and easiest and of these the Gladiolus flowers most readily of all summer bulbs. The bulb has the flower already formed in it. Once planted it needs only cultivation. The beautiful spikes of bloom these bulbs produce sell readily at 25 to 50 cents per dozen all summer long for decorating homes and for business places. Their beautiful form and lovely colors appeal to all. Several plantings ten days apart will give flowers from July until October. Last summer *we raised millions of these bulbs on our farms* and now we offer these fine blooming bulbs at wonderfully cheap prices. We give the best reds, the best pinks and many variegated kinds.
To interest young men and women and others in raising flowers, and to give them an opportunity to prove for themselves the money-making possibilities of Gladiolus, we have placed the *prepaid prices* for these bulbs lower than ever before.
Market Gardeners have and can make money growing and marketing these flowers with their vegetables and plants.
We will prepay to any P. O. in the U. S., with our 1914 Catalog.

The Home Acre.

Blistered Currant Leaves.

In 1911 I set in my garden 100 currants. They all grew well. Last year, 1913, after blossoming, the leaves began to curl, or more like blisters all over the leaf, and as the season advanced they turned a reddish brown. What is the cause and what can I do for them? I sprayed repeatedly with white hellebore.
Cambridge, N. Y. W. E. R.

Blotting or blister-like appearance of currant leaves is most usually due to an excess of nitrogen in the soil. This condition of the leaves is rarely present when the bushes are given a balanced ration. The following kinds of farm manure will affect currant leaves in the manner described: Fresh or partially rotted horse manure, sheep, poultry and pigeon manure; cattle and well-rotted hog manure are best suited for currants. If these are not available, use commercial fertilizer compounded from pure raw bone and muriate of potash, proportioned to contain, total phosphoric acid 15 per cent., equivalent to ammonia 3 per cent., potash soluble in water 5 per cent. This is a well balanced ration for currants and gooseberries, and should be applied at the rate of 600 to 800 pounds to the acre. K.

Protecting Trees From Rabbits.

What will best protect young fruit trees against the work of rabbits? I have had several dwarf trees, five years old, destroyed during the past few weeks, besides considerable damage done to young standard trees. The latter were wrapped for a distance of about a foot from the bottom with tar paper. On these they have worked on the lower branches; on the dwarfs they have girdled the trunks. Will a thick coat of whitewash, scented with carbolic acid, and applied in the Fall to the trunk and lower branches, avail anything? Would a strong solution of lime-sulphur, applied in the same way, offer any resistance? Or is wrapping and fencing in the only protection? W. W. L.

We have found nothing better than mechanical protectors, such as tarred paper, thin strips of veneer, or even heavy corn stalks tied around the trunks of trees. These should be put on two feet at least, or better, three feet from the bottom of the trunk, and tied securely. We doubt if lime-sulphur even when treated with carbolic acid would give permanent protection. It might for a time, but sooner or later it would be wiped or washed off. Some form of grease or blood smeared on the trees is said to help, but the surest protective is a mechanical one properly put on.

Inter-cropping Asparagus; Grass for Lawn.

1. I am going to put out five acres of asparagus this Spring; have put eight tons of manure to the acre. Can I put this in corn without hurting the asparagus? I would like to get something for the manure and labor. 2. I have a light sandy loam; is there any grass that I can sow on it that will stand the drought? What kind of top-dressing should I put on to get grass to grow?
Pedricktown, N. J. J. C.

1. There are two or three important essentials necessary to the successful culture of asparagus that cannot be overlooked, and to deprive the plants of any one of them, will result in "grass" of inferior quality, and consequent loss to the producer. It should be the aim of every grower to produce nothing but a No. 1 grade for in these days of close competition, no other kind can find a profitable market, therefore nothing should be overlooked or neglected in the handling of the crop. As earliness is greatly to be desired, a warm well-drained sandy soil with a southern exposure and well protected from the direction of the prevailing cold winds of Spring is the best for this crop, and as asparagus should have the full sunlight the entire day, it must not be planted in the shade of trees nor anything else. The plants are gross feeders, and the soil can scarcely be too rich for them, and if the plants are not well supplied with food, at all times, they will not produce this maximum weight of first-class sprouts. Eight tons of manure to the acre is only half as much as should be applied, and to plant corn among the asparagus would not only deprive the plants of the necessary sunlight and air, but being an annual of rapid succulent growth, it will rob the asparagus plants of quite all the fertilizer and moisture in the soil, and so weaken the plants that it will take at least a year longer for them to produce marketable sprouts. If asparagus is to be made profitable, it must be well fed and properly cultivated. I would suggest that in addition to the manure, you apply one-half ton of coarse bone meal to the acre, or 35 to 40 pounds of muriate of potash, and 95 to 100 pounds of finely ground natural phosphate rock, to each ton of manure.

Clearing Ground for Raspberries.

We have just cleared several acres of scrub oak running from two to six inches in diameter, growing from old stumps, 14 to 30 inches in diameter, besides a network of "catgut," bayberry, etc. We wish to set this land out to berries this Spring. Can you advise us as to treatment of the land to remove stumps and get ready for raspberries? Do you think it necessary to lime the land?
Eatontown, N. J. E. A. B.

If I had several acres of this ground I would follow one of two methods. If I had several men employed on the farm and could work at these stumps at odd times I would try to get them out by grubbing, and with the aid of horses and stump pullers, doing it all when the men could not be profitably employed at other work. But if I wanted them out at once, and did not have a number of men already employed, I would by all means try dynamite. From reports that I have heard at different times I believe the ground can be cleared of large stumps by dynamite much more economically than by any other method. In almost every section there are men who have had experience and follow up this kind of work and will be only too glad to make an estimate as to cost. After stumps are out one or two hoed crops like corn or potatoes would kill out the weeds and put the ground in much better shape for raspberries than if they were planted at once. But since they are to be planted this Spring the best plan will be to get as many of the wild roots out as possible. This can be accomplished by thorough plowing, preferably with a new ground plow, and successive harrowings with a harrow that will bring the roots to the surface. As to lime, I would be governed by the kind of raspberry planted. The red raspberry is a lime-loving plant and thrives in a sweet soil. But the black raspberry is the reverse and does best on land that is a trifle sour or acid. TRUCKER, JR.

Heating a Hotbed.

Asking for advice on the subject of using an oil stove for heating a hotbed underneath, with a sheet iron bottom for the bed, H. S. H., on page 37, is advised against the idea. In my judgment that advice is sound. But the authority who gives the advice against the oil lamp idea of "H. S. H." submits a plan which also, it seems to me, has objectionable features. The construction of the hotbed as proposed by "K," involves so much that one might better go on and build a hothouse and be done with it. The tile pipe, for heat radiation, being simply a continuance of the stove pipe, cemented together as proposed, would doubtless be satisfactory for a short time, but stove pipes have to be cleaned frequently and every time this was done, it would, I should suppose, mean breaking up the whole piping, buying new tile and doing the work all over again under difficulties. Another fault I believe is in the use of a small heating stove. The small stove, without much regard to the character of the fuel is a snare and a delusion for such purpose. They require a vast amount of attention.

Why might not H. S. H. use his oil stove, but in a different way from his original suggestion? Why not put together a few lengths of galvanized pipe for a hot-water circulating system, to run under his beds? Use almost anything that would serve the purpose for a very small boiler under which to put his oil stove. Build a little box of a coop over a pit dug outside one end of his hotbed in which to set his diminutive heating plant. There would be even heat, about as little danger from fire as possible and once in 24 hours, or at the most twice, would be as often as it would require attention. I have seen a very considerable chick brooder house and system heated in a similar manner.
ROBERT S. DOUBLEDAY.

Cadillac

Standard of the World

The Cadillac has twice received the highest honor ever conferred upon a motor car

The Dewar Trophy is the World's Blue Ribbon award

You will be interested in this story because it is a story which no other American automobile maker can tell about his own car.

About seven years ago, Sir Thomas Dewar, member of the British Parliament, and an enthusiastic motorist, presented an elaborate silver cup called the "Dewar Trophy." This trophy was to be awarded each year by the Royal Automobile Club of Great Britain, to the motor car which should during the year, accomplish the greatest achievement demonstrating the advancement of the automobile industry.

The first award was made to one of the high-priced English motor cars.

The second award was to the Cadillac in the early part of 1909. This award was in recognition of the successful completion of the remarkable "Standardization Test."

In this test, which was conducted by the Royal Automobile Club of Great Britain, three Cadillac cars were completely dismantled and the parts thereof thoroughly mixed so that identification was impossible. Eighty-nine parts were withdrawn from the heap and duplicates taken from the stock of spares. Three cars were then rebuilt from the haphazard heap. Wrenches and screw-drivers were the only tools employed. Neither files nor emery cloth were permitted—nor were they necessary; yet every piece fitted as perfectly as in the car from which it was taken.

It is part of automobile history that the Cadillac is the only car in the world which has ever successfully met a real standardization test.

When you realize that in many of the parts, a variation of the one one-thousandth fraction of an inch would have meant failure, then you can realize the wonderful significance of this test.

Standardization, according to its true meaning and as it is applied to the Cadillac, means that every part of a kind is exactly like every other part of its kind. It does not mean nearly like it or almost like it.

In the Cadillac car there are more than 400 mechanical operations which are not permitted to deviate to exceed the one one-thousandth part of an inch (which is about one-third to one-half the thickness of a hair from a person's head) from prescribed limits of measurements.

There are some operations in which the limits of permissible variation are reduced to the half of one one-thousandth of an inch.

Cadillac standardization—with every essentially accurate part exactly like every other part of its kind—insures thorough interchangeability and that when for any reason it becomes necessary to replace a part, the new one will fit and fit correctly without the slightest alteration.

The Cadillac Company is prepared to replace any part of any car it ever built. No Cadillac user was ever obliged to discard his car because of inability to obtain some needed part. No Cadillac user was ever obliged to undergo the annoyance and expense of having some needed part made to order because the maker had gone out of business, or because he had discontinued making parts for old models, or because he has to depend upon some outside parts maker to supply it.

Standardization according to its true meaning and as it applies in the Cadillac, further means the correct alignment of parts and units so that they will operate in harmony with each other.

THE DEWAR TROPHY

Cadillac standardization precludes the possibility of ill-fitting joints and bearings. It decreases the great power absorbent—friction. It reduces wear and automobile troubles to a minimum. It brings operating and maintenance cost down to the lowest notch.

For several years following the award of the Dewar Trophy to the Cadillac, this trophy was awarded to high-priced European cars, the Cadillac making no effort to win it.

However, in October last, the 1914 model Cadillac entered into the contest and again it came out victorious.

In this test the car was driven 1000 miles over give-and-take roads. The object was to test out its reliability and dependability for all-around every-day service in the hands of the every-day user.

The car was compelled to maintain a certain average speed. It had to stop and start frequently to test its self-cranking device. It had to prove out all the electrical system in starting, lighting and ignition, including their dependability and durability.

The two-speed direct drive axle was given special attention, including its efficiency in promoting luxurious riding qualities together with gasoline and oil economy.

The Cadillac made the remarkable record of more than 17 miles per gallon of gasoline in spite of the frequent stops and starts in testing the cranking device. It made the remarkable record of 1000 miles on less than a single gallon of lubricating oil.

It is a most significant fact that the Cadillac is the only American car that has ever been awarded this great prize—the most coveted prize for automobile excellence in the world. It is also most significant that the Cadillac is the only car in the world to receive the award the second time.

The buyer of a motor car,—in justice to himself,—cannot ignore the significance of these Dewar Trophy awards.

The first award to the Cadillac proved it to be the most accurately and the most scientifically constructed car in the world.

The second award to the Cadillac proved it to be the car of all around super-excellence as a whole. It proved it to be the car whose dominant features are the ones which contribute most to all around dependability, for day-in-and-day-out and year-in-and-year-out constancy and satisfactory service in the hands of the every-day user.

And these are the things which the wise buyer seeks in his motor car.

If there is any class of men today who are entitled to the best there is and who do not need to be satisfied with anything short of the best, it is the farmers of America.

When you buy a Cadillac, you have the satisfaction of knowing that nobody can criticize your judgment. You know that less money can buy only less value. But you know that more money cannot buy greater real value. You know that in the Cadillac you have obtained the greatest value obtainable in any car. You know that you have a car in which you can take the utmost pride.

You know that you have obtained the car which the highest motor tribunal in the world has twice crowned as the car of superior excellence.

Seven passenger Car, $2075
(Illustrated)

Five passenger Car, $1975

Cadillac Motor Car Co., Detroit, Mich.

Chimney Cleaning.

The kitchen stove and the furnace were both smoking badly, so the good man decided the pipes and chimneys would better be cleaned. Armed with pans, scraper, shovel and wing, and accompanied by the hired man, he attacked the job. The pipes were duly taken down, and rapped out, the soot was shoveled from the chimneys, then the question arose, how to remove the heavy coating of soot that encrusted the whole inside of the chimney. Finally a handful of straw was placed in the chimney and ignited. It blazed up quickly, setting fire to the soot. In a few minutes the chimney was as clean as though newly built. This method of chimney cleaning was new to me; it may be a useful suggestion to someone lese. N. C. R.

Heating Upstairs Room.

I notice in a recent issue a query as to some convenient way of heating upstairs rooms. As I have until recently lived in western New York I have had experience in that line. We have found the best and most economical way to be this: With the stove on the first floor we place a drum or radiator of sheet iron in the room above so the pipe passes through this drum. We find that the room with the drum will heat as quickly and as well as the room below containing the stove. If wood is used the upper room will get the better heat, with coal not quite as good, yet very satisfactory. By this plan we save much of the heat which under other circumstances is wasted. In fact it gives us about twice the heat for the same expense.

Collins, Miss. F. M. S.

A Simple Towel Roller.

A great many housewives prefer the continuous towel mounted on a towel roller. It is easy to make a towel roller, and the material is at hand in practically every home. The articles required are two hooks of the kind used to suspend a window-shade roller, an old broom handle and two nails. Saw the broom handle the desired length of the roller. Drive a nail in the center of each end. One of the hooks may be closed, and the head of the nail should be removed either by a cold chisel or by clipping it with wire pliers. The other roller holder should be open and this will not be necessary. Select a place for the towel, and mount the roller the same as one would the window shade. A window-shade roller might be used in place of the broom handle. The end in which the spring is placed should be removed. One end might be left and a nail driven in the freshly cut end. WALTER JACK.

Ashtabula Co., O.

Burning Zinc to Clear Soot.

On page 1253, November 22 last "Inquirer" asks regarding the use of zinc scraps to remove soot from stove pipe, when burnt in stove. Some years ago, I worked the night turn at a telegraph office which was heated by a small stove, burning bituminous coal, with a five-inch smoke-pipe running horizontally for about 12 feet with a right angle turn about midway, with a rise of six inches to the chimney. Steam coal, which is the smokiest of the soft coals, was the fuel supplied, with the result that the pipe soon showed indications of being filled with soot. We had heard of burning zinc to remove soot, and as there were a lot of old crowfeet from the battery cells on hand, the day man burnt zinc and I burnt, too, with the drafts open and drafts shut; made no difference. The zinc burned with a blue-white flame and white smoke but the draft was just as poor after burning as before. So we took the pipe down and dumped out the soot, which had filled the pipe so only a 2½ inch hole remained for the smoke, in spite of all the zinc we burned. After further experiment we found the only way to clean the pipe was to put paper and dry wood in the stove until the soot ignited, and then tap the pipe with a light rod, loosening the soot and ashes so the draft carried them into the chimney. Of course such a procedure would be rather dangerous with a shingle roof.

I know of one instanee where the smoke flue from a steam boiler was run up from the basement through a radiator on the first floor and into the chimney, which was taken out after a short time because the radiator filled up and spoiled the draft. This radiator had a number of small tubes running across the path of the smoke. W. J. M.

Laying Oilcloth.

I read a suggestion on handling oilcloth or other similar covering for kitchen floor, and laying same. I have found the strip that runs around the room at bottom of base board, to be just the thing to hold the covering down at edges. Nothing can get under and you need no nails; see sketch. Pry the molding up and slip oilcloth under, then drive down again.

J. DOOLAN.

Boarding Elderly People.

Can you do an old subscriber an odd favor? Could you put me in touch with an elderly couple or old person with means to pay their way who would like to make their home at a country farmhouse with all home comforts included; warm room with fire, washing, plenty of milk and eggs and are willing to pay me for doing for them? I will board them reasonably. I am willing to take an invalid and do for them as I have no better way to earn money. There are only three of us in family; it is a quiet place. There must be some people who would appreciate such a home as I can give them, and are willing to pay me for it. I will do all I can to make it pleasant for them. I can send them the best of reference. Can you help me in this? I thought you might know of some such people. MRS. G. B.

Troy, N. Y.

R. N.-Y.—We have had several applications of this nature before. It is a strange thing that only a few days before this letter came we had another from a farmer and his wife, who had been left with an elderly woman on their hands. Her sons, after contracting to pay for her board, have failed to provide for her. We give this as one of the sides of life which are to be met in the country. The plan as suggested by Mrs. B. is a worthy one.

Old Rags as Labor Savers in Kindling

Our rag carpet days are over, and as far as selling rags to the tin peddler, we have never realized any satisfaction from such transactions. We use our rags to build fires. To do this one may take a quart or two quart fruit jar, tear any old garment in strips or squares two thirds yard in size. Pack in several of these rags in the can and saturate with kerosene. A rag may be drawn from the can, lighted, and it will require but little kindling to start a fire. We have a soft coal stove and frequently have used no kindling only the rags in starting the fire. Many people have the kerosene oil practice well fixed in their fire kindling system, and rather than dash on a cup of oil on kindling, try a rag. Less oil will do more efficient service. When fires are low yet there are coals, some people take a chance pouring in a quantity of kerosene. This is dangerous, but by taking a saturated rag and crowding it below the kindling in the fire box or below the lumps of coal, by the use of the stove poker, there is no danger.

MRS. GERTRUDE JACK.

REMOVING WASTE-PIPE STOPPAGE.—While washing out some bottles at my sink, I accidentally dropped one of the stoppers down the waste pipe. It lodged in the pipe some way, making it a very difficult job to remove it with a piece of wire. The water would run through very slowly, so I decided upon a plan in the following manner: I first placed a wooden plug in the outlet of the drain. In the meantime I turned the water on, allowing the pipe to fill, when I soon discovered the stopper floating on the top. The plug was then removed from the drain and the sink was clear as ever. S R.

"BLIGGINS has a very orderly desk." "Yes. He is one of these men who won't leave a paper lying around. He promptly puts it in a pigeon hole and loses it forever."—Washington Star.

"Do any of the good things you hope for come to pass?" "They all come to pass, but they come and pass so dogoned swift I can't grab 'em."—Credit Lost.

FROM OUR FARMS TO YOURS

Farm Management.

KEEPING FARM ACCOUNTS.

If observation and investigation conducted over a period of 30 years are worth much it will indicate that not over one farmer in one hundred has any systematic method of keeping his accounts. Occasionally I have found one who keeps account of his receipts. He may possibly keep a record of the amount he pays his hired man, or the contractor on his new barn, but the chances are that he does not. When the day of final settlement comes there is argument and disagreement, and sometimes a lawsuit. I was recently called to help settle a dispute between a farmer and a contractor over the building of a barn. A contract had been written in which wages by the day at $1.75 to $2.50 were mentioned, but no classification of the workmen was made, and the contract price of $345 for the building of the barn, which is 44x70 feet with nine-foot basement and 18-foot superstructure and a curb roof was also mentioned; possibly with the idea of making it optional with one of the parties to make a choice, but no choice was mentioned, and neither party had signed the contract. A set of blue prints were made and the work was done very nearly as indicated by the prints. The carpenters did some extra work and the farmer and his sons assisted the carpenters to some extent. Some changes were made in the original verbal agreement. The farmer advanced money to the contractor until he considered that with the work he had done he had paid fully enough, but the contractor considered that he had done much extra work that had not yet been recompensed, so he threatened suit. Neither one had kept any book accounts. Each depended on his memory for necessary data. The case was so complicated that the attorneys consulted felt that a compromise would be the best method of settlement, and three carpenters of wide experience were called in to assist. After a careful examination of the building and without any consultation each placed his estimate on a slip of paper and the three estimates were within $21 of variation. A settlement was soon effected. Had each kept an account a settlement might have been effected with less trouble.

Now that each person must present the details of his income for the inspection of the Internal Revenue collector for the purpose of satisfying the income tax law it is absolutely necessary that everyone should be prepared to give exact figures, and these can be obtained in no other way except by the careful keeping of accounts. The Internal Revenue agent who will accept mere guesswork in this matter more than one year is absolutely unfitted for the office he holds. The man who does not have complete records on which to base his report will be found making oath to a falsehood. Let no farmer, or for that matter let no man who desires to be classed among honest and patriotic citizens, be without a perfect set of account books carefully posted for the year 1914.

The writer has been keeping careful accounts for more than 40 years and it was the work of only a few hours for him to fill out his statement to the revenue agent, for the exact figures were available for the purpose.

I know two brothers who lived on adjoining farms and exchanged work more or less for several years. Finally they decided to setle up the accounts, which were recorded on the tablets of the memory only, and each accused the other of dishonesty. It lead to an estrangement that has never been healed. This should not have occurred if each had made it a rule to record the date of each transaction with the character and value. My books have saved the necessity of paying a number of bills the second time. One merchant sent me a statement of several purchases which he alleged I had made, and it became necessary for me to show him from my books that I was not in the city on the dates he gave. Neither was any member of the family in the city on those dates. Another sent a statement of account and I had to show him his receipt for payment of the identical bill. A carefully kept set of accounts will save any man money every year of his life.

JOHN L. SHAWVER.

Saving You $220

On Reo the Fifth

This year we offer you a saving of $220—of 16 per cent.

The 1913 Reo the Fifth sold for $1,395, completely equipped, including electric starter. This years' car, even better equipped, sells for $1,175.

Tires and electric starters both cost less this year. But most of this saving comes through factory policy.

Three years ago Mr. R. E. Olds built this great chassis as his final car. And he said that it marked his limit. Many thousands of these cars have been sold since then, and against each car we made a charge to cover all the machinery we bought to build this car.

Now that investment has been all wiped out. We now figure only factory cost, and the saving goes to our buyers. That is one result of building one perfect car and confining our output to it.

Streamline Body Electric Starter

This year we adopt the streamline body, which is now European vogue. This beautiful body is the coming type. The angle dash is going.

We use the best equipment made for electric starting and lighting. In every way the car's equipment is modern and complete The finish is perfect. The upholstery deep and rich.

And this car alone has the one-rod control. No levers in the driver's way.

A Costly Car

Reo the Fifth is famous as an honest car. It is built throughout in a careful, costly way. We add in these ways to the necessary cost about $200 per car.

The steel is twice analyzed. Our materials are made to formula. Our gears are tested in a mammoth crushing machine. Each driving part, as a margin of safety, is given 50 per cent over-capacity.

Each engine gets five long and radical tests. Close-fitting parts are ground over and over to give utter exactness. Nothing is ever hurried

We use 15 roller bearings. We use 190 drops forgings to avoid risk of flaws.

Cars of this model are kept running night and day, covering thousands of miles, to reveal any possible weakness.

The result is the utmost in a well-built car. An almost trouble-proof car. Small cost of up-keep. A car built to run for years and years as well as it runs when new.

No car in this class compares with Reo the Fifth for a man who buys a car to keep. Thousands of men now know this.

Sold by a thousand dealers. Write for name of nearest dealer. Also for catalog.

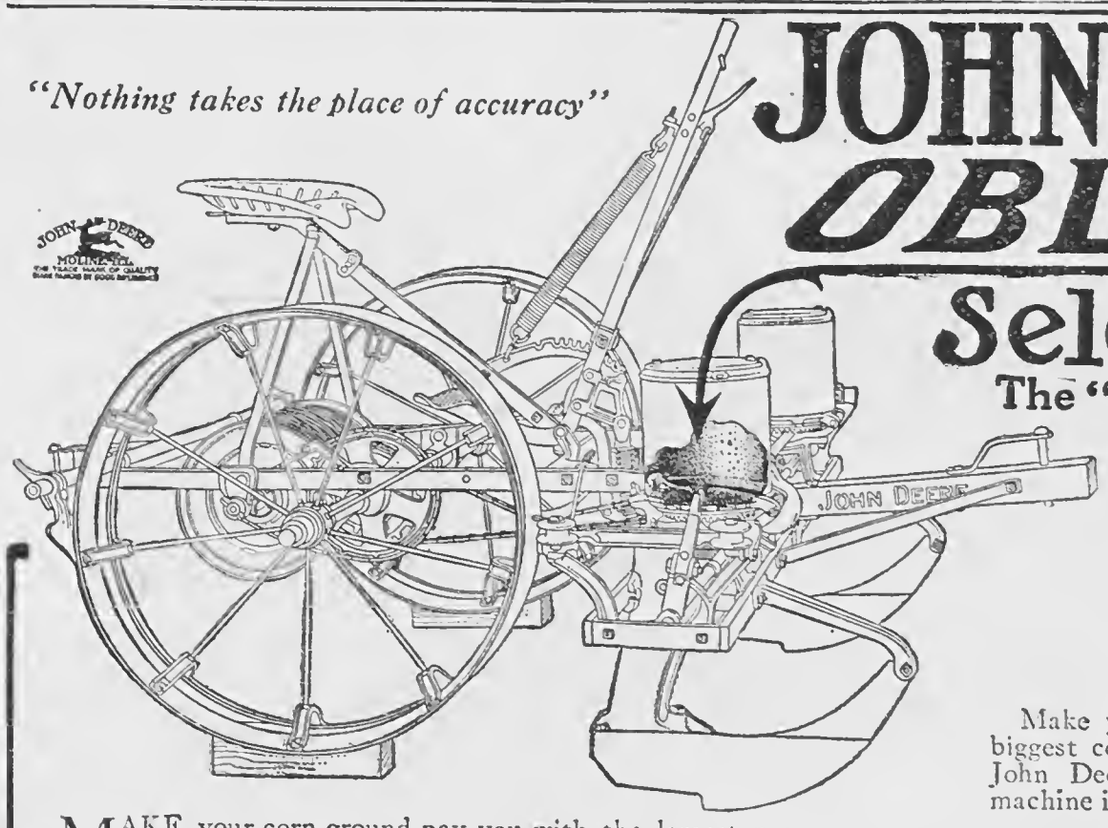
"Nothing takes the place of accuracy"



JOHN DEERE OBLIQUE Selection

The "Natural" drop

This machine maintains high accuracy even with ordinary seed. With well selected seed its dropping accuracy is practically perfect.

Make your spring planting the start of your biggest corn crop by accurate dropping. The John Deere "Oblique Selection" will do it. The machine is a splendid investment.

MAKE your corn ground pay you with the largest possible yield, by making sure that the required number of kernels is in each hill.

The seed must be there. Every "miss" means just that much thinner stand. No amount of cultivation can make up for inaccurate planting. The loss of one ear from every hundred hills costs you the price of one bushel per acre.

For years the John Deere Company has concentrated on accuracy in planting devices. The "Oblique Selection" solves the problem.

The results of its use are so profitable that many corn growers have discarded the best of previous machines. It is as far ahead of the old Edge Drop as it was ahead of the round hole plate.

Free Book Gives Valuable Corn Facts

Write us today for free booklet "More and Better Corn". It tells you why the average yield for the United States is only 25 bushels an acre, whereas better methods have produced 125, 175 and even 255 bushels per acre in places. It also describes and illustrates the John Deere "Oblique Selection" Corn Planter. The book to ask for is No. D 33

John Deere, Moline, Illinois

How To Make Your Garden Thrive and Mature Early

The kind of plant food required in your soil depends on the kind of a crop you are to raise. In order to make your garden produce its maximum yield at the lowest cost for fertilizer you should supply only those elements which are immediately available and which will be absorbed by the plant.

Consumers Brands

For Gardeners, Fruit Growers, Florists and General Use

Comprise special distinct compositions of plant food elements for vegetables, small fruits, root crops, flowers, greenhouses, lawns and tree-crops. They supply only the constituents your particular soil needs for some special crop. For example our

Early-Crop Odorless Fertilizer

supplies your soil with the four plant food elements in immediately available form needed by vegetables and small fruits for quick growth and early maturity. It is the most effective and convenient fertilizer you can apply for such crops and in the end—the most economical.

Write today for prices on any quantity and for our *free* Fertilizer Booklet—it is full of valuable information and is as valuable as a text-book on soil fertility.

Special Parcel Post Offer

Our Mak-Gro Odorless Plant Food is a clean, high grade granular fertilizer for indoor and outdoor use on potted plants, flower beds, small fruits, lawns and small gardens. It is *made especially for the amateur* and is pleasant to apply. We will mail a five-pound bag to any address for $1.00 or quote prices on larger quantity. Write today for special circular.

Farm Management.

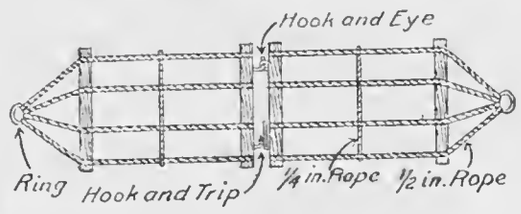
Unloading Hay.

Regarding hay unloading by horse power I find slings the finest of all unloaders for all kinds of hay and grain. For unbound oats they are perfect, as it is almost impossible to use anything else in unloading loose oats which are of short straw.

I purchased one double sling of the largest size, six feet wide and long enough for 18-foot rack, and from this

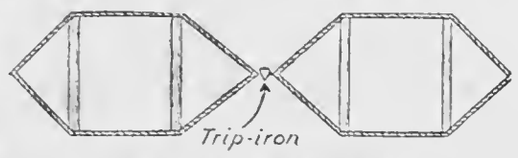
ARRANGEMENT OF BOLTS AND STICKS.

pattern I made three more, buying three sets of trip irons to put on those I made. This makes four sets of slings which are enough to unload any load two horses can draw to barn. In buying slings one must also buy a sling car but if he has a car and does not care to buy a new one, a special sling pulley can be bought that will work on any car, but these pulleys cost $3 and are very unhandy.



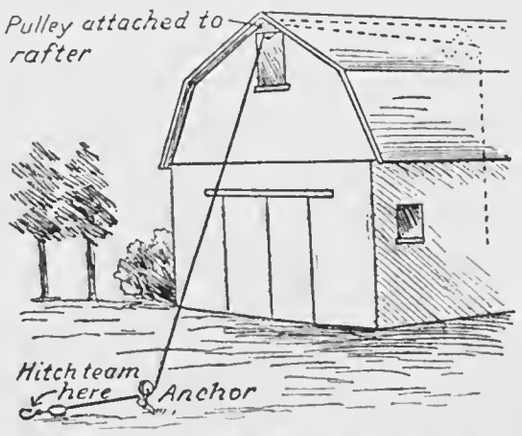
SLING THAT WORKS WELL.

Slings not only leave the hay-rack clean but put hay, etc., into bay in such a manner that it is much easier to handle and mow away than from a hay fork of any kind. By getting one set of slings any handy man can from this pattern make any number of slings for less money and have a better sling, as the ropes in ready-made slings are not as good as ropes you can get at any hardware store. You must remember of



WRONG KIND OF SLING.

course to buy the desired number of trip irons. My slings for my 16-foot rack take about 80 feet of one-half inch rope and 20 feet of one-quarter inch; for the wood parts four sticks six feet long and 2x2 inches square of sound straight-grained basswood. Get two half-inch iron rings about three inches in diameter (one at each end of slings). The above is for one sling, for three slings three times the above would be needed. Each sling takes 16 quarter-inch bolts, about four and one-half inches long to bolt ropes to sticks, staples are not satisfactory. Take these bolts, cut off heads and bend over into a square hook which



HOW THE DEVICE WORKS.

will hold ropes very secure. Here is a rough sketch of slings. Hook and eye and hook and trip are the set of trip irons mentioned and cost about $1 per set. Do not get the second sling as shown above, as they will not handle loose short oats very well.

My barn is 40x50 and 38 feet from floor to peak, and has a window in peak at each end through which I pull instead of having hay rope come back down to barn floor. This method takes less hay rope and you get a more direct pull, as shown in the cut. As said before it takes less rope and you have a more direct pull, but it also does away with flying pulleys which have been known to kill men, for if your pulley should break in peak of barn the window sill would catch it immediately. F. J. H.

Farming on Shares.

Can you give me some plan of how to work a farm of 140 acres on shares? The owner wants a married man, either on salary or shares. The owner has two or three horses, wagons and harness. The farm has been worked by a man who furnished his own tools, and got half, but the owner is not satisfied with his work. As he bought this farm but a year ago, he has no tools and stock, but would like to furnish tools, horses and cattle. I have no tools nor stock; have been working by the year. I would take one-third of all raised and sold on farm. He thought of putting on some feeders, but I said I preferred milch cows, as there are about 30 acres of pasture, with flowing water, and can send milk to cities (car stop about three-quarters mile). I thought about eight or 10 cows could be kept and we both could realize some cash every month. Myself and boy, 15 years old, can do good part of the work until harvest; then I would have to hire some help. I said I would take $600 and work it for him, but he would like to have me take it on shares and I would too. What kind of contract should be made as to shares, and who is to pay thrashing and pressing hay if any is sold? Would I have to feed my share of corn and fodder to the cows, also hay and oats? C. S.
Ohio.

Where owner furnishes all the equipment and live stock, seeds and fertilizers, one-third is usually given for the tenant's share, varying somewhat according to the value of the equipment and the condition and state of cultivation the farm is in, as the owner of a run-down farm, poorly stocked, would have to give more than one-third for the labor. As to the thrashing and baling hay it would seem in this case that the owner should pay those bills, but the tenant should board the thrashers and pressers, and of course pay all the extra help. The stock should be fed from the undivided fodder and grain, and at the expiration of the lease as much should be left on the place as owner furnished before crops are harvested. The surplus may then be sold. In this case as the prospective tenant knows the place, he can estimate what he can reasonably expect to realize from it and the terms he considers necessary may become a part of the lease. A written lease should be drawn for the protection of both the contracting parties.

W. M. K.

Septic Tank Again.

Can a closet be made in a farmhouse to empty in a septic tank and work well? Can all the connections be done by home-labor? This place is in Northern Putnam County on the outlet of two lakes with water controlled by the city of New York. The outlet from these harbors run right through our farm, and is about 250 feet from the farm building. The city has taken the land about 200 feet wide on each side of this outlet, and the house is within 75 feet of the city land which the highway divides from us. No descent in any way but to the city's lands. The outlet from the kitchen sink went under the highway and emptied in the city land, and last year we had orders to build a cesspool for that outlet on our own side of the road, and did it. Can we build a septic tank on the other side of house and can that be allowed to discharge across or into the road? As I understand the overflow from a septic tank is not injurious. I. L. B.
Mahopac Falls, N. Y.

Any water closet may be connected with a septic tank, but the latter cannot, of course, be operated in connection with ordinary dry closets. The best method of disposal of the effluent from a septic tank is through a system of tiling laid beneath the surface of the ground, and it would seem probable from your description that such a system might be installed between your house and the city's land. It is preferable that the lines of tile should not greatly exceed 50 feet in length and they should have a fall of one-sixteenth inch to the foot; if given much greater fall than this, the discharge from the tank would at once rush to the ends of the lines of tile instead of seeping out throughout their length. The grade between your house and the road may be such as to make it impossible to secure this moderate fall. The tank itself may be placed as close to the house as is necessary. If a filter bed is constructed to purify the effluent from the septic tank, discharge from that may be safely disposed of in any running stream, or upon the surface of the ground, though the city might not permit this upon their land. The discharge from a septic tank is not innocuous until it has been passed through a filter bed, or purified in the surface layers of the soil.

M. B. D.

NEW YORK STATE NEWS.

INSPECTION WORK.—The inspection work of the Department of Agriculture is one of the chief activities of that department, and it is highly important. In its relation to "pure foods," of which so much is said these days, these inspections are of vital concern to all. To illustrate something of the work done by the department it may be interesting to know that during the first two months of the present fiscal year, October and November, agents of the Department made food and sanitary inspections in 716 cities and villages outside Greater New York, which included 1,971 of food, 9,000 of milk, 360 of veals, 307 of oleo, etc. The total inspections numbered 4,676. During the same period in Greater New York 2,426 food inspections were made, 3,500 of milk, 1,459 of veals and 2,855 of oleo, making a total for the entire State of 10,545 inspections.

APPLES IN STORAGE.—Not all the apples of the United States are grown in the Hood River country. Western New York districts, the apple belt of the Empire State, at this writing have in storage about 517,000 barrels and 25,000 boxes of apples. It is to be remembered that the bulk of the crop has been marketed several months prior to this. There are 78,000 barrels at Albion, 67,000 at Lockport, 64,000 at Medina, 46,000 at Leroy, 45,000 at Gasport, 41,500 at Holley, 34,000 at Brighton, and so on. The 25,000 boxes are at Canandaigua.

ANOTHER HOLSTEIN CLUB.—The Holstein breeders of Allegany and Steuben counties have organized a local Holstein-Friesian association with 60 charter members. They represent about 3,000 head of the black and white cattle. E. E. Poole of Alfred, is president; A. L. Spencer of South Canisteo, secretary and H. L. Stephens of Greenwood, treasurer.

LARGE APPLE SALES.—Barreled fruit has been in demand in Wayne county this month. Addison Weed of Rose sold 2,000 barrels for $10,000 and W. H. Cole 10,000 barrels for $45,000. Williamson and East Williamson are great shipping centers. From the former place there have been shipped this season 1,535 carloads of fruit and vegetables and from the latter place 797 cars, making a total of 2,332 cars from one township. Of these shipments about 800 carloads were apples.

MILK COMMITTEE MEETS.—The committee recently appointed by Gov. Glynn to inquire as to the desirability of new legislation regarding the production and distribution of milk and its proper inspection, held its first meeting February 16. A majority of the committee was present and elected Commissioner Huson chairman and W. N. Giles secretary. It was decided that public meetings should be held by sub-committees on the questions of production, distribution and marketing of milk and at the following places: Buffalo Chamber of Commerce Feb. 24; Rochester Chamber of Commerce Feb. 25; Middletown Grange hall, Feb. 26; Sidney town hall, Feb. 27; Syracuse Court House, Feb. 27; Watertown Chamber of Commerce, Feb. 28; and at Albany at a date to be announced later.

THAT TRACTION ENGINE BILL.—Commissioner Carlisle talked to representatives of the Brotherhood of Threshermen the other evening at Rochester and advised them to bring their complaints and wishes to Albany. His opinion seems to be that a weight limit for engines should be established that would permit the use of the old cleats on the lighter engines and make flat cleats compulsory on the heavy machines that really do the damage.

STATE RURAL CREDITS.—Another step has been taken to give the farmer the benefit of easier loans. Assemblymen Fish introdueed a resolution that laws should be enacted which would provide ample funds in banks in rural communities for loans to farmers; facilitate the "procuring of proper securities by any person engaged in agriculture who is found to be thrifty and honest "though of scanty means"; provide for a low rate of interest on such loans, and provide for postponing to the utmost possible limit the forced sale of property pledged or mortgaged by a farmer to secure a loan which he has failed to repay through circumstances beyond his control.

GRANGE TO INCORPORATE.—Gouverneur Grange is agitating the question of incorporating and building a new hall. The Grange has a membership of about 420 and it is increasing monthly.

HIRED HELP FOR THE FARM.—Commissioner Huson states that there are a large number of men familiar with farm work who are making application to the Department for employment. Many of these men have drifted to the cities from farms but as work is slack with the manufactories just now they have been thrown out of employment. Farmers who will be in need of help in a few weeks are advised by the Department to take advantgae of the present opportunity to secure help as later it is likely to be scarce. While wages are only nominal just now, in March and April the usual prices will doubtless prevail, and good men can be had at about $20 or $25 per month. The Department is receiving applications from men with families who want to work on farms and among them are many good immigrant farm laborers. It would seem to be a wise thing for farmers who know that they will require help by the month ere long, to avail themselves of the present opportunity to get it. J. W. D.

HABITS OF GEESE.

Geese are naturally monogamous, but association with man has blunted their moral sensibilities and they are easily persuaded to adopt polygamy, but if one wishes for the best fertility of the eggs, not more than two geese should be allowed with one gander. The mating by separation from the other geese should be done in the Fall and they should be kept apart till Spring. After they have become thoroughly mated they may be allowed to run with the rest of the flock, unless one wishes to remate one of them, or an unmated gander attempts to alienate the affections of some matron.

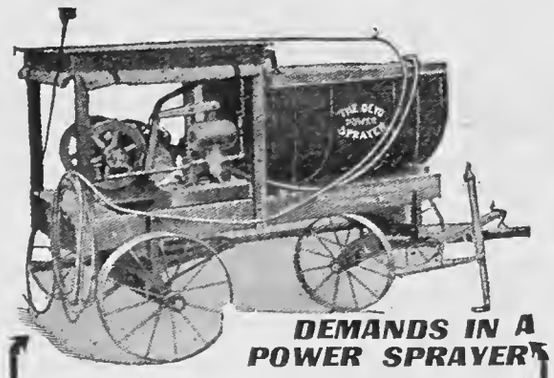
Geese will choose some quiet nook or corner for a nest, and if a low box or other receptacle be provided in the pen it will usually be occupied and, once used, will be the nest for the season. The eggs should be collected as laid, kept in a cool (not cold) place and turned daily. The first clutch of from 12 to 20 eggs should be set under hens, or in an incubator. When the goose becomes broody she should be placed in a small, dark enclosure and given water but no food for two or three days. Upon release from solitary confinement she will soon get busy and lay a second clutch of eggs. A goose can frequently be induced to lay three sets of eggs. She should be allowed to sit on the last clutch. Incubation requires 30 days. It is recommended by some that the eggs be placed for about one minute in water heated to a temperature of 104 degrees Farenheit, when they have been incubating 25 days. Upon hatching the young ducks should not be fed for 24 hours. Their first food would consist of mash, slightly moistened, and plenty of grass on the sod, which they will pick for themselves. Some feed a mash of cornmeal, some rolled oats. Later bran, middlings, cooked vegetables and meat scraps may be added. A little fine grit and a pinch of salt should be put in all mash. A handful of ground charcoal added to the mash occasionally will help keep the goslings well.

By the time they are a week old goslings need no hovering by a hen in ordinary weather, and may be allowed to run as they please during the day. Of course at night they should be penned up. At all times they should have access to growing grass, and they will feed on it till their necks are stuffed almost to their heads. This will be digested during the night, and turned into meat that will compare favorably with any that is put upon the table for dainty digestions. If any are to be killed at 10 weeks of age they should be confined in small pens when eight weeks old, and fed on mash that contains more cornmeal than their ordinary food. Great care should be taken not in any way to scare the fattening birds. Every fright means a loss of weight, fat and profit.

The birds that are to be kept for breeders, or at least till cold weather, need little feed but grass. A feeding of corn at night will attract them to their house or pen, where they will be safer than in the open. If one is breeding birds for exhibition, or wishes them to attain the maximum size, he will of course see that the growing geese get an abundance of feed. Young Toulouse geese from standard weight parents may be fed to a weight of 20 pounds by Christmas. As cold weather approaches geese should be fed more corn than is needed earlier in the season. As the breeding season comes on the amount of corn should be decreased to prevent an overfat condition that would interfere with egg-laying and fertility.

Geese should have a dry pen at night, especially in cold weather, with protection from storms, but will prosper in less elaborate quarters than almost any other domestic bird. They are remarkably indifferent to atmospheric conditions, spending the day out of doors in the severest weather. The small amount of feed that suffices to keep geese in good condition and contented, makes them the most cheaply kept birds on the farm.

W. H. HUSE.



DEMANDS IN A POWER SPRAYER

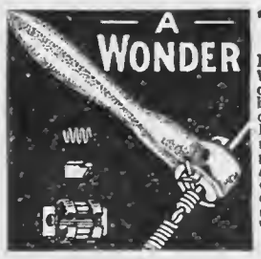
are proper but uncomplicated DESIGN, strong and skilful CONSTRUCTION, a reliable pump, a dependable ENGINE, perfect AGITATION and a well made and thoroughly seasoned cypress TANK.

Of course, there are other important details, but in every way that a sprayer must be perfect, the

DEYO POWER SPRAYER

is complete and beyond all criticism and comparison. It runs perfectly on any ground, and in all temperatures, has DEYO ENGINE and direct connected pump. Write to us to-day for FREE ILLUSTRATED BOOK telling all about DEYO POWER SPRAYER and ENGINES.

DEYO-MACEY ENGINE COMPANY
22 Washington St., BINGHAMTON, N. Y.
Richardson Mfg. Co., Worcester, Mass.
Kendall & Whitney, Portland, Maine



THAT WIRE FENCE

Built quickly with the National Wrapper & Splicer. No change of grip necessary as wire is held by revolting ratchet head. (See cut). Workes in closest spaces. Fits any gauge wire. Send 75 cents money order and receive one parcel post. Money back if not satisfied. AGENTS WANTED. Quick Seller, one man sold eighteen first day out. Write today.

KING HARNESS
Will Outlive Your Horse

Buy custom-made, oak-tanned harness direct from factory at *wholesale prices*. We can save you money on any harness. All harness guaranteed—money back if not satisfied. Big free catalog illustrates over 75 styles for all purposes—sure to show harness you need. Send for it today. We also sell Horse Clothing and Fur Coats. Ask for catalog

KING HARNESS CO., Desk C. Rome, N. Y.

Eureka

Send for Catalog—FREE

Potato Planter

Profitable for the large or small grower. Plants potatoes at lowest possible cost. *One* man operates it. Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if wanted)—covers up—marks the next row. Accurate, automatic and dependable. Sold with or without Fertilizer Attachment.

Here's why you should select the Eureka Potato Planter:—Furrow Opening Plow is directly under the axle—that means uniform depth at all times. The seed drops in sight of driver. Steel and malleable construction makes long life and few repairs. Made in three sizes—for one or two rows.

We also make the Eureka Mulcher and Seeder. Shipped from branch near you.

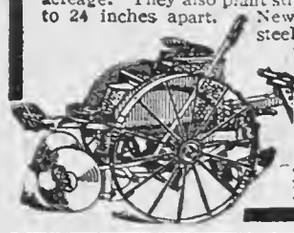
EUREKA MOWER CO., BOX 940, UTICA, N. Y.

Potato Profits

depend largely on how the crop is planted. Every skipped hill is a loss in time, fertilizer and soil. Every double wastes valuable seed. It means $5 to $50 per acre extra profit if all hills are planted, one piece in each. That is why

IRON AGE 100 Per Cent Planters

Often pay for themselves in one season on small acreage. They also plant straight, at right depth, 12 to 24 inches apart. New angle steel frame and steel seed hopper. With or without fertilizer distributor. Ask your dealer to show you this Planter and write us for booklet, "*100 Per Cent Potato Planting*" and copy of IronAge Farm and Garden News.



BATEMAN M'F'G CO.
Box 1025 Grenloch, N. J.

Make Money Pulling Stumps!

Add new, rich, crop growing land to your own farm by clearing it of stumps. Clear your neighbors' land. Your Hercules will be kept busy when others see what it does. Big profits for you. With the

Hercules All-Steel Triple Power Stump Pullers

you can clear an acre a day. The *known* and *proved* stump puller all over the civilized world—easiest to operate.—most durable. Special introductory price, 30 days' trial offer, 3 years' guarantee, on immediate orders. Write for big Free book of land clearing facts.

CROPS AND PRICES.

The Winter has been very changeable in this section, temperature as high as 75 degrees and down to four below zero. There are many sales of farm stock. Farmers are still well supplied with corn and hay. Not many of the best breeds of cows are kept. What they call good cows bring from $50 to $75. Hay, Timothy, $15 to $17 per ton; potatoes, 70; dressed chickens, 17; live, 14; eggs, 30; milk, $1.80 per 100 pounds; calves, 10; hogs, 11. This is quite a tobacco country, and the acreage is nearly that of wheat. Prices good, 8½ cents. Many silos; some are raising good stock of calves. Good farm horses, $95 to $225. Not many raising Alfalfa, but are talking and inquiring about it; beginning to use lime, and are asking about the burned lime and the ground limestone. Some very good roads, but many very bad. Not many farms for sale. Farmers are talking and seem to be interested in up-to-date agricultural matters.
Honey Brook, Pa. T. H. G.

At a sale recently, young horses brought $150 to $193, western horses $150 to $250 or more. Fresh cows bring $60 to $125; pigs $7 a pair. Corn 65 to 71; oats 45 to 57 for 32 pounds; wheat 95; potatoes 80; butter 31 cents wholesale, 34 retail; eggs 35. Chickens, live, wholesale, 14 to 16½, wholesale dressed 16 to 18; retail 20 to 22 dressed. Hogs dressed $11 cwt; fat good cows, $6; bulls $7; steers $8 cwt. Loose hay $10 to $15, bale $12 to $17. Bran $29, gluten $32; wheat middlings $31; oil meal $36. Apples have been nearly a failure the last two years. W. H. H. S.
Doylestown, Pa.

Butter 32; milk 16 cents per gallon. Milk seven cents to family trade. Cows from $60 to $120; calves 10½ cents per pound live weight; heifers $40 to $50, yearlings; fat beef 8 to 8½ cents, live weight; grade stock bulls, yearlings, from $25 to $40. Pork 10 cents dressed. Good draft horses from $250 to $275. Apples 50 cents per basket; cranberries 20 cents a quart; celery three to eight cents a stalk. Celery hearts 25 cents a bunch. White potatoes 80; eggs 34, strictly fresh. Onions $1.25 per bushel; lettuce 10 cents per head; cabbage five to seven cents per head; sweet peppers two for five cents; carrots five cents per box; turnips 60 cents per peck; chickens 18 cents, live weight. Wheat 90 to 93; rye 75; corn 70; corn ears, per ton $17; oats 45; bran $1.35 per cwt.; middlings $1.50; rye middlings $1.30; mixed feed $1.40 to $1.70; corn chop $1.40; gluten feed $1.55; oil meal $1.90; cottonseed meal $1.80; flour, best patent, $2.60 per cwt.; pastry flour $2.30 per cwt. Hay, (Timothy and clover), mixed $18 per ton. The prospects for the coming harvest are not very good, as the ground is bare and the temperature some days is very warm and then cold again. The ground had all the frost out a few days ago, but at this writing it is frozen all over again. We had very little snow this Winter so far.
Northampton Co., Pa. E. J. C.

Horses will range from $150 to $225 as to quality; cows $80 to $100; veal calves 9½ cents per pound; fat cattle seven cents; heifer 800 to 1000 pounds, about 6½; hogs from seven to 8½, as to size; sheep, Spring lambs, $6.85 per hundred; western, about $5; ewes, about $4.50. Wheat 92; oats, about 36; corn 65; rye 80; Timothy seed $2.50 per bushel; clover $7.50; hay, No. 1 Timothy $13 No. 2, $11; No. 2, clover, $12.50; rye straw $7; wheat straw $6; butter 26; eggs 25; chickens 14; geese 13; turkeys 18. Potatoes 80; apples $1.25; onions $2 to $2.25. E. C. B.
Danville, O.

The peach and apple buds are quite some size, another week as moderate as the past two weeks and lots of the buds would have opened. But at this writing, February 8, the thermometer registers 32 and last night 24. The cold snap started February 6, with a cold rain and snowed through the night and part of the morning, then rained and cleared off cold. There is quite a lot of speculation regarding the crop of peaches and apples among the growers. J. W. K.
Magnolia, Del.

New corn has sold as high as 63 cents here, and as low as 53 cents since husking. Oats, 33 to 37 since thrashing. We in Iowa are short of an average crop of corn; 30% oats; about an average crop. Winter wheat better than average, but not as large as 1912, when some wheat went higher than 50 bushels per acre. Land here sells from $175 to $225 per acre, so you see we have to raise some crop to pay any dividends on investments.
Waukee, Iowa. H. S. S.

We have had genuine Winter weather for the week past; mercury has been at zero most of the time, but reached 20 deg. below one night. Snow is about six inches in depth where the wind has not moved it. A few are hauling logs and wood to town. Considerable hay remains unsold. Stack hay brings $8 and barn hay $10 per ton at the farm. Cows coming fresh bring $50 to $75 each. The ice companies around Chautauqua Lake are conducting the ice harvesting at the full limit. P. S. S.
Mayville, N. Y.

FARM ENGINEERING.

Kinks in a Rope

Will someone tell me how to treat a new hay-carrier rope so it will not kink and will give the best service? C. M. W.
Winterton, N. Y.

This was discussed two years ago at some length in THE R. N.-Y. Several persons advised boiling the rope hard for half an hour, which they said would prevent the kinking. Others suggested coiling the rope to the left, then putting the end down through the coil and coiling again to the right. In other cases the advice was to pull the rope out first on the carrier with the horses turning to the left, and then to change them a few times with a turn to the right. In this way it is said the kinks will be straightened out.

Dissolving Pitch; Freezing Pipes

1. I have two barrels of pine pitch; I would like to use it as a shingle dip. Can you tell me of anything that would make it in a liquid form, so that it would not get hard when cold? I tried coal tar. I could not keep it mixed, the pitch would get hard in a few minutes and sink to the bottom. 2. I have cold and hot water in my house. In a very cold night the hot water pipes freeze, the cold water never freezes. Both pipes are protected from the cold alike. Can you explain the reason? A. S.
Nova Scotia.

1. Spirits of turpentine, coal tar naphtha or benzine should act as a solvent for pitch. I would recommend trying the benzine. 2. We have never seen this explained. There may be several explanations. In the first place the hot water is under less direct pressure than the cold, as will be seen by comparing the force of the streams when the taps are opened. This would allow it to freeze sooner. Secondly, the hot water is constantly in gentle motion due to convection currents, while the cold water is practically quiet. Hence the hot water would freeze sooner. Thirdly, much of the air in the hot water has escaped, thus facilitating the freezing process. R. P. C.

Preventing Frost on Glass.

What can I put on glass in a covered wagon to keep the frost off? On cold mornings the frost gets so thick that it is almost impossible to see out. I scrape it off and then it freezes over again. I carry a lantern inside, but it does not help much. C. P.
Geneva, Ohio.

Heat inside will not help much unless it is sufficient to keep the glass dry. Ventilation below the window, allowing cold air from the outside to rise over the surface of the window on the inside, will help, but better than that, a mixture made in the proportion of one ounce of glycerine to one pint of alcohol when smeared over the glass will prevent both steaming and freezing or sweating either. If desired, a little oil of amber can be added to improve the odor. R. P. C.

Pumping Problems.

I have a couple of problems to solve, and would like a little help with them. 1. How large should I make an open V-shaped trough to convey water to my garden, at the maximum rate of 90 gallons per minute on a grade of three-sixteenths-inch to the rod? 2. How high is it practicable to lift water with a pitcher pump, at this altitude? Surface of water in well is 3,649 feet above sea level, according to U. S. Geological Survey. C. H. J.
Helena, Mont.

1. If the angle between the boards forming the V-shaped trough is a right angle, a trough with inside length of each side of the V equal to 10¼ inches will supply 90 gallons per minute when running full under the conditions you mention, provided plank is used for the trough. If planed wood is used, the sides need be but 10 inches. 2. A pitcher pump in good condition ought to lift water 20 feet up there. R. P. C.

SAFETY FIRST

Quality, Service and Lower Cost Mileage for Goodrich Tire Users

Goodrich Unit Molding is really the original "Safety First" idea in tire construction.

❖ ❖ ❖

Safety *must* go deeper than the tread.

❖ ❖ ❖

It *must* be made into the tire. Goodrich Tires are built on a foundation of safety.

❖ ❖ ❖

The quality of Goodrich Tires today is the standard by which all high grade tires are judged. This is because they represent the perfection of tire-making and tire-knowledge — which gives Goodrich Tires their leadership.

❖ ❖ ❖

The body of the tire, side walls, fabric, rubber, bead and tread are balanced and interlocked through and through so that the whole tire is one live unit.

❖ ❖ ❖

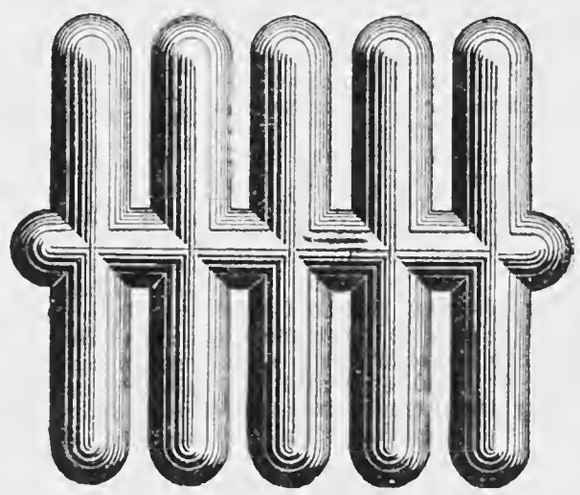
The user of Goodrich Tires gets the utmost in service and mileage, because each tire wears as a unit—every part of the tire helping every other part to perform the service demanded of it. This is one of the reasons why Goodrich Tires give better service and lower cost mileage.

❖ ❖ ❖

And now the Goodrich Safety Tread solves the skidding and sliding problem for the motorist and gives him "Safety First" in actual operation as well as in construction.

Goodrich Safety Tread Tires

Best in the Long Run



Five Bars and a Crosstie
The "Safety First" Symbol

The strong rubber fingers of the Safety Tread clean and grip the road. They stop the skid before it starts. They make the brake effective and make your steering sure.

No odd projections to knock out the underlying tire structure.

❖ ❖ ❖

Just the unit-group of bars and crosstie which brace and balance the strain on the tire so that the Safety Tread runs as a smooth tread does and gives more actual service and mileage.

The following are the prices on the best tires ever produced in the Goodrich factory. Don't pay more. Your dealer will gladly sell you the famous Goodrich Tires at these prices:

Size	Smooth Tread Prices	Safety Tread Prices	Grey Inner Tube Prices	Size	Smooth Tread Prices	Safety Tread Prices	Grey Inner Tube Prices
30 x 3	$11.70	$12.65	$2.80	34 x 4½	$33.00	$35.00	$6.15
30 x 3½	15.75	17.00	3.50	35 x 4½	34.00	36.05	6.30
32 x 3½	16.75	18.10	3.70	36 x 4½	35.00	37.10	6.45

THE LAND OF FULFILLMENT

A STORY OF HOMESTEADING

By ROSE SEELYE-MILLER

CHAPTER III.

The Lure of the Land.

Still coughing harshly, Nate bent over his prostrate friend, striving to find his heart, his breath, and to roll that great recumbent body over to an easier position.

"Stop that coughing! Haven't I told you a thousand times you'd better give it away?" Norm's voice was fretful, irritable, but the voice of an angel could not have sounded more satisfactory to Nate.

"Glory!" cried Nate, "Glory, I'll do anything on earth to please you—but that. I can't quite-quit this habit yet—to please even you." Nate managed to gasp out. "Are you sure you're alive?"

"I guess so. Where are we anyway—I can't seem to quite remember," and Norm raised himself on his elbow, and looked down on his long length of limb lying by the splintered tree. "Oh, I know—the lightning struck the tree. I guess I couldn't have been struck much, just knocked silly for a few minutes. Where's the gun? Is it all blown to flinders?"

"I hope so!" Nate declared emphatically, if you haven't any more sense than to hunt in a storm like the one just passed over. Can you move?" Nate was prying at Norm's impassive form, for he had not yet tried to get up. "If you have any idea where we are and can get back to camp, we'd better do it. The oxen pulled up stakes and went away, and the grub came mighty near getting a washout. I'm no woodsman, and no good at anything." Nate's voice trailed away into tremulousness. Some way the shock of his fall, the wound on his head, and more than all, his terror for Norm, had about unnerved him.

"Whew!" said Norm. "We do seem to be up against it, I haven't any sense of direction left, if we find the camp it will be an accident, but we may as well sally forth and mosey on," Norm finished whimsically, for the tenseness of the situation needed relaxing.

"How did it happen?" Nate asked, following close on Norm's heels.

"I don't know. I had been walking along hunting for squirrels, and I had just aimed at my last one, when there came a terrific shock, that tree went crashing down, my gun flew into space, and I just toppled over too, I 'spose. I hadn't noticed that it had been clouding, I thought it was getting dark, and I was just about ready to start for camp."

"I wish you had started, and got there," Nate said warmly. "If we can't have better luck than this we'd better wait till the clouds roll by."

"If we can't find the camp, we'll have to find a sheltered place and make a fire; I guess I've got some matches."

"I don't know where you'll find a dry place," Nate replied, pessimistically, and even as he spoke, he lost his footing and sank down, down, down.

Norm, who was a little ahead and to the right of Nate, failed to hear the crackling of Nate's footsteps behind him and turned to see what the matter could be. "Nate, Nate, Where are you?" he called, "NATE!"

"I'm here," came a muffled voice, that sounded faint and far off.

"Where?" Norm's voice was incisive.

"Here, here, here!" Nate kept calling." "I've fallen through into some kind of a hole. Watch out that you don't fall too."

"Hurt any?" Norm asked, cautiously approaching the place from whence issued Nate's guiding voice.

"No, not hurt. Here, I'll strike a match, so you can see where you are." The match flared up feebly, but the little spot of light showed Norm the opening through which Nate had fallen. He stretched himself carefully on the ground and crept to the brink of the hole. Nate struck another match, which revealed to Norm's woodsman's eye a small cave, and apparently not inhabited by wild animals. He let himself down into it.

"Talk about luck. If this isn't the best piece of luck that could have happened to us. All we have to do is to express a wish, and lo, the thing is done!" Norm spoke gaily, and he lit another match, caught up a piece of light wood, and finding it resinous, he touched the match flame to it. "A torch, of the most approved style!" he cried. "Now we'll see what's come to us!"

"Solid rock below," Nate approved.

"And a lot of dry leaves and litter for a fire." added Norm. "It's a good while since anything has been in here, for the leaves and litter had entirely covered the open space."

"Let's explore a little further," and Norm's torch flickered along the passage, showing an opening at one end, through which they passed; this revealed a larger space. The torchlight drew back toward the opening through which they had come, proving there was a draught, which would carry the smoke of their fire upward and out of the orifice.

Going back satisfied, Norm gathered leaves and litter into the middle compartment. "We can make a fire here, and have our whole bed warm, for the stones will heat up and keep us as warm and dry as can be."

"That'll be a comfort, for we're both pretty damp," Nate assented.

Norm touched a match to the dry stuff, and in a few minutes a grateful warmth stole over the cave. Norm threw off his game bag. "We may as well eat a little to pass the time away," he said cheerfully, and he drew out two squirrels and a grouse. "Which shall it be, quail on toast or squirrel on stick?"

"That which will cook quicker," Nate cried, catching up one of the squirrels and stripping off the skin, for he had learned to do that deftly. Both boys were feeling peculiarly gay, for the relief from tension and the sense of escape from death and separation made them by turns both gay and grave.

"If we miss your heart's desire in the West, we can come back here and start a stone quarry," Norm said looking around at the granite walls.

"Sure," Nate agreed. "All we have to do is to lift our hands or stamp our feet and the earth yawns beneath us, and spreads her bounty for the taking."

After the joyous feast was over, the boys lying near the genial warmth of the fire, talked long and gravely.

"Do you know," Norm said, "I believe if a fellow wants a thing long enough, and works hard enough for it, that it eventually comes to him?"

"If that's the case, I'm going to begin to want things hard."

"Oh, but you've not only got to want them, but work for them. You've got to keep yourself dry, and breathe deep, if you expect to get—what you want—and you've got to breathe deep, and eat decent, if you want to get to be the Strong Man," Norm counseled.

"I hate to be a 'sissy,'" stormed Nate, "always looking out for myself. I'd rather have a hand like a ham, and a skin like leather, than to be the finest pink dude in New York," he declared vehemently.

"Want it hard enough then," Norm advised. "Folks mostly always think their own troubles are the worst in the world. Before you came, I used sometimes to think life hard and bitter and lonesome. I had never really asked for a pal, or hoped for one, but I had wanted one, and wanted him fierce, and then—you came——" Norm paused.

"Do—do you think that—God had anything to do with it?"

"I hadn't thought—but if He's good—why not?"

"Maybe good things will keep right on happening," Nate said tentatively.

"If you get into the sunshine, you're bound to feel it—and if you get out of it, why that's one's own lookout," Norm was voicing his most sacred belief. "If we get into the mud—we're bound to be dirty—but if we keep out of the dirty things—of life—we're bound to get into clean ones."

"Well," Nate ejaculated slowly, "Well, then it's surely up to us—I wonder if I can hop to it."

If anything could have knit closer to the hearts of these two comrades, that night in the heart of the earth would have done it. Boys seldom speak of the deep things of life, but both Nate and Norm had been brought face to face with some of them, and the simple confession of Norm's faith, impressed Nate strongly, and Nate, quite unconsciously caught hold of it, and was lifted up and helped by it.

They woke to a dismal morning of gray clouds and a raw wind, gave promise of a steady rain. The ashen sun showing feebly through the sodden sky, gave them a hint of direction, and it was not more than half an hour after leaving the cave, before the camp was sighted, and at a little distance the oxen were grazing, dragging their picket ropes as they moved from one succulent bunch of grass to another. Norm tethered the oxen, and then they had coffee which Nate had made, partaking hurriedly of their breakfast.

"We're in for a rainy spell, and if we are to make any progress at all we'll have to fix some sort of shelter on the wagon. We'll take the lumber and build a little shanty, and nail it to the wagon, then we can eat or sleep, or live right on the wagon if necessary, and it will keep our provisions and supplies dry."

"I wouldn't wonder if I could hit a nail," volunteered Nate. "But I couldn't construct a pig pen to save my life." Norm went about unloading the lumber and cutting it into suitable lengths. It was not long before a very creditable, ark-like little structure loomed over the wagon, and the supplies were placed safely beneath its shelter. The oxen, fresh from their long rest, and rich feeding, and refreshed by the rain and the cool

"DEATH, TAXES AND The Mapes Manures

Are the Only Three Things in This World I Am Sure of"

WROTE AN OLD CUSTOMER OF OURS

Passing by the first two, he and every other farmer certainly has every right to be sure of THE MAPES MANURES. They have been used for fifty years by the most intelligent, the solidest and most successful farmers, who have banked absolutely on

I. THE RECORD OF MAPES IN THE FIELD.

Our record in the field for the past fifty years is too well-known to require more than a mere reference. In this connection, "lest we forget," in the American Agriculturist's Prize Contest, open to the entire United States, the largest crops of Potatoes and Corn grown on commercial fertilizer alone were grown with Mapes; 669 bushels of Potatoes on one measured acre with the Mapes Potato Manure, and 213 bushels Shelled Corn on one measured acre with the Mapes Corn Manure.

II. THE MAPES RECORD WITH THE EXPERIMENT STATIONS.

We are equally proud of our record with the Stations. There may at times have been an occasional chance analysis which was not quite what we would have liked, and not fairly representative of our goods, but on the grand average, year in and year out, our record has been something to be justly proud of.

III. SAME FAMILY MANAGEMENT FOR THREE GENERATIONS.

Not only have the Mapeses continued successively in the business for three generations—grandfather, father and son—but the Lanes, who have been associated with the Mapeses from the start, follow the same identical record in the business, grandfather, father and son, successively. Could there be a better guarantee than this family management, with the element of family pride deeply involved, that everything has been done and will continue to be done to make the Mapes Manures as good as the knowledge of fertilizer science permits for the crops for which they are intended.

The Mapes Manures have never stood still but have been constantly improving as the knowledge of scientific plant feeding broadened and progressed.

"The Mapes business had its inception in the scientific research and experiments of Professor James Jay Mapes, and scientific research and experiment, coupled with the most exact practical experience, have been the dominating factors in the Mapes business to the present day."—The Florida Grower.

SEND FOR OUR PAMPHLET

The Mapes Formula & Peruvian Guano Co., 143 Liberty St., New York

weather started off briskly, down the road that led to the Golden West, the Eldorado of many dreams.

A sodden, dismal, three-days' rain ensued, making the roads almost impassable, and not adding to the hilariousness of the journey. Beneath the shelter of the "coop," as they called it, the boys spent many happy hours talking of their past, their present, and most of all their future, making many plans, few of which would ever materialize, but all of which lent zest and interest to that hour, and left the mind better and braver for the antieipatory joy.

The country changed its aspeet. The trees became more and more scarce, and the hills less and less rugged, and as they progressed, finally merging into an even, billowing, splendid plain. At the beginning of the fourth day, the elouds lifted, and the sun shone out gloriously. A breath of bracing air as clear as crystal smote Nate's nostrils. He drew in long draughts of it, expanding his thin chest to its full capaeity.

"We've reached the heights," he exulted. "We'e got to the tall timber—the tall timber for muh!" he chanted ecstatically. And Nate jumped from the wagon, and knelt upon the sod, lifting his hat.

Norm was beside him, walking about briskly. "I believe we have crossed the line. Why, this is good, this is great, this is grand!" and Norm too knelt and began digging into the rieh earth. "Why, it's as blaek as mud and as rich as fruit cake. And to have it for the taking—to have it for the taking!"

"There's no end to it. See it stretching away, away into eternity!" exulted Nate, less drilled in the knowledge of the value of soil, was thrilled through and through with the vastness, the wonder, the glory of the plains.

"Ilo, ho, the lure of the land is striking into your soul. I knew it would—I knew it. No one can help loving the soil, if they are on it and with it, and for it, for a little."

"It unrolls like a great seroll of plenty," put in Nate. "Think of that land covered with grain, with cattle, with every kind of produce. I ean't get my share too quick! Sueh land! Let's hurry!"

"It's a hundred miles yet, before we ean file on land. I'd like to ship these oxen and stuff, and fly," growled Norm. "Some one'll get all the good land before we get there," pessimistically.

"It looks as though there were quite a lot of land left for settlement," Nate eomforted. "And the trail is as solid as macadam, no mud here, we can travel right along now."

Three days on the open prairie, three days on the windswept plains, with flowers blooming around them, with blue skies rising above them, with joy encompassing them, the boys went forward, and at the end of the third day they came in sight of a little city lying white and green upon the plains.

"Wetasket, the City of my Dreams," crite Nate.

"But not the Country of Heart's Desire, for there are no stones. It's all like a cleared field, with never a stump or a stone, a shrub or a tree, a hill or a ravine. If God had planned to make farming easy for man, He could not have made anything bettev than this—better than the Dakota plains."

That was Norm's verdiet, and while his years did not tend to give weight to his judgment, the experienee erowded into his 21 years did. He had seen life at its hardest, where tillable land must be wrested from old forests, where hardly a foot of free soil could be found, unhampered by stumps and tree roots, and often if free soil could be found it was dead with sand, it could hardly be eoaxed to produce a crop of grass.

On the outskirts of the city, canvas-covered wagons were in great evidence, lumber wagon, under which rested tired men; smart buggies, where, perhaps some pink-cheeked bride awaited the eoming of her new husband, who had gone to file upon land for their homestead. Deciding that this was the general camping ground, Norm halted and pieketed his oxen, then the two boys went into the city, where the bustle of life and motion bespoke a very vital current flowing in from the great arteries of the world. Men of all nationalities were there, and men apparently of nearly every elass and condition in life, men in rough clothes, men in foreign apparel, men in dress suits and men in heavy tweed, in jeans and jumpers, in overalls and checked shirts, and all seemed comrades together, for all were bound on the same great quest, the quest of land. Many wanted land for speculation; some, like Nate, wanted it for their restoration to health; some wanted it for bona-fide homes, and some wanted it just because others did, all swept along in the great flood tide of emigration that swept into Dakota in the eighties.

Norm and Nate found the Land Offiee easily enough, for there were a hundred ready to direct them, but they also learned that it was closed, but would be open on the following morning. After walking about for sometime, enjoying every breath of life about them, they went back to the open field, for had they wished it there was not room in the city to accommodate half the would-be stayers, and the price of lodging, food and hostelry were prohibitive to the two homesteaders.

The next morning Norm and Nate took a stand upon the steps leading into the Land Offiee, but they were quiekly followed by others, and long before the offiee opened the steps were not only filled but a line crowded out into the street. All were good-natured, eager, talkative.

"Wheat went forty bushels to the acre, in this county last year," a voice close to Norm was saying. "I've got a letter here to prove it," and he drew forth a many-paged letter, and an eager erowd pressed near to see. "Oats ninety," the voice read, "and sueh vegetables never seen before—potatoes came out of the ground clean enough to cook—"

"Huh!" scouted another voice.

"Raised on sod," a quieter voice pacified. "There isn't any mud here, roads clean and smooth as bricks. No struggling with mud hub deep here, like there is in ——."

"Nor sand hills, nor sawdust," volunteerd another.

"And no washing land; why down in the plaee I come from, land just all washes down to the foot of the hills."

"I guess we've got to Paradise," Nate whispered to Norm.

"Folks are always disgruntled with the things they know; they all want to try something new. It maybe, that this country has its drawbacks too, but they're not visible on the outside." What other aphorisms of wisdom Norm might have bestowed upon the erowd will never be known, for the key elieked in the office door, and the boys entered to their destiny.

"Land?" queried the dapper land agent, Mr. Stamford.

"Yes," Norm put in quiekly. "We want to get land in this county, and as near this town as possible." Norm was burning with land fever and he did not purpose that Nate should ruin his prospects by asking for a plaee to pick stones.

"Land in this county is selling for—"

"We don't want to buy, we want to take up homesteads."

"Oh, you said you wanted land in this county and near town—"

"Yes, but we want to file on it," Norm reiterated.

"All the land in this country was taken up long ago, and all near the towns. Men have been pouring in here like a flood for many months."

Many faces turned pale and many ears listened to the next query. "Isn't there any vacant land then?"

"Here's a plat of vacant lands," the agent said, pointing to a curious map on the wall. This map was all divided up into small square plats, numbered, and the boys learned that the squares indieated counties, townships, sections and quarter seetions of land aecording to their size.

"Would you wish to seleet your plat and file at onee, or would you wish to inspect the land."

Norm looked dubiously at Nate. This filing upon land was not quite such a simple thing as he had at first thought it to be.

"I reekon, we'd better look at it first."

"There is no doubt that is the best way, but you'll lose much valuable time, and maybe by the time you get baek with your plat selected, someone else will be out there building his house."

"I reckon we'll spend one day looking at the land, anyway," and Norm turned away disappointed.

"It all looks about the same to me. Why not just file and have it done with!" protested Nate. But the agent was busy with the next in line, and Norm thrust a platted card into his pocket, which had been given him for his guidance.

They drove along for many miles, but the land apparently had broken out into an eruption of small shanties; there seemed no vancant plats.

"It looks as though all the country were given up to poultry raising," Nate remarked drily. "See the ehicken coops!"

"I imagine," Norm responded gravely, "that those are the 'frame dwellings' referred to in the improvements required of settlers. All we'll have to do will be to pull the nails out of this ark, and lift it on our seleeted plat. Our house is built."

After some 20 miles of driving the land became more rolling, and a grassy creek bed was sighted, the ereek itself soon came into view, and while the trail seemed to lead down its preeipitous banks, there was no sign of a bridge, and a considerable stream of water went rolling over the stony bottom. The shanties were upon both sides of the creek, but none very elose to its banks, although just beyond, they were still found, and a little farther on, men and boys were constructing more shanties with lightning-like speed.

"Did you ever see so many bones? Why four miles we've ver travelled through a sheet of dry bones!" eclaimed Nate as his eyes swept the country.

"Must be buffalo bones," Norm conjectured.

"Who could ever believe there'd be so many! Must have been collecting here for centuries."

They rode along silently, until they came to a plaee where no shanties were erected. "Bones, bones everywhere, I've got a bone to pick," paraphrased Nate. "Let's talk with this last land-holder.

"This land beyond here vacant?" inquired Nate pleasantly.

"It is vacant all right, but it isn't surveyed, and isn't in the market. My land runs up to the end of the surveyed land."

"All the land taken in between here and the creek?" asked Norm aghast.

(To be continued.)

Saves hard work

Gardening with **IRON AGE** Drills and Wheel Hoes

is a very simple matter—the stand-up, straight ahead way—the safe way for the plants—the most economical way for ground, time and money—the most productive way for good crops—the only way to get a good garden in dry time—the healthiest way for all concerned.

Market gardeners, home gardeners, seed growers, nurserymen, poultrymen, are all interested in these tools.

Women, boys and girls can handle them—many farmers' wives have been able to supply their tables in season with the best of fare, and with little expense or effort, when they could not depend on the men making garden.

Ask your dealer to show you samples and write us for booklet:

"Gardening with Modern Tools."

38 styles and combinations

Use of these tools solves three problems:
High cost of living
Fresh vegetables and fruit
Healthful exercise

Sows in drills or hills

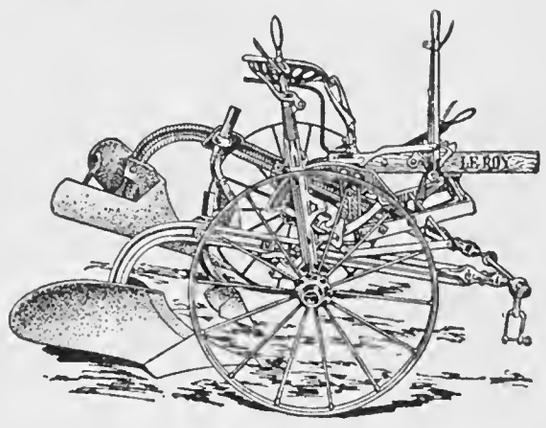
BATEMAN MANUFACTURING CO.
Box 102-G GRENLOCH, N. J.

These Are Reasons Why The Light Draft LeRoy Reversible Sulky Is The Best.

The All Steel Frame **LE ROY REVERSIBLE SULKY PLOW** is guaranteed to do better work than any other reversible sulky plow made.

A remarkable feature of advantage over all other makes is the noticeable very light draft. If your horses get tired and sweaty, hitch onto a Le Roy and watch them cool off. There is no need to rest your horses if you use a Le Roy. Ask any farmer.

To obtain the hardest and strongest plow points possible, only the best grades of iron are used, mixed with the utmost care to insure strength and good wearing qualities. Moldboards, points and landsides, perfectly chilled. Frame is made of high grade steel and malleable iron.



MANUFACTURED BY
The LeRoy Plow Co.
LeRoy, N. Y., U. S. A.

The LeRoy handles just as easily in small fields as large and will turn the same size furrow as any other with much less horse power.

Every farmer likes the **LIGHT DRAFT LE ROY** because it works so easily, does such good work in a large variety of soil, is easy on the horses, pays for itself in such a short time and saves walking seven miles to the acre. Ask your dealer for a trial or write us.

We are not in a Trust or Combine, but are a strong Independent Co.

NOTES FROM A MARYLAND FARM.

We are having our annual February cold snap. It always comes with the full moon in February. I do not know that the moon has anything to do with it, except that the atmosphere is apt to be very clear at that time and radiation rapid. But we always look for this spell to break the Winter, for we rarely have any real Winter after it passes.

The sweet peas sown in January are not yet up, but the Fall planted ones are thriving and promise an early bloom, and I shall sow some more after the cold snap to see what the difference will be with these and the usual January planting. It is necessary, however, to get these started early if we are to have any bloom at all, for they soon succumb to the hot weather in late May.

Owing to the mild Winter the leeks and the green onions are lapping. Leeks are still in the garden, and the onions planted from sets in September are already large enough to use. For early green onions I plant sets of the Norfolk Queen, a larger onion than the Queen of the Northern catalogues, but still a very early one. These are followed by the potato onions, the offsets of which furnish green onions and the large bulbs are left to ripen.

My first sowing of tomato seed was made February 10, in a flat in the greenhouse. They will be transplanted to other flats as soon as large enough to handle, and from these will be set in the cold frame, giving room to make short stout plants. As I use on the frames the double glazed sashes which keep out all ordinary frost, I can set the plants in the frames early in March, and by exposing them to the air at every opportunity, can keep them short and make strong plants that are not long and weak-kneed, and they grow off without much of a check as they lift from the frame with quite a mass of soil.

Eggplant seed is not sown till March, and potted and shifted from small pots to fours, and kept in the greenhouse till the leaves are as large as my hand, for it is useless to try to harden an eggplant, and they are not set till the soil is quite warm if that takes till June. I have discarded all but the Black Beauty, as it gives me more fruit than any other variety.

Just at this time friends are sending me sundry seeds for trial. To-day I had from a correspondent in Southern Colorado a pod and seed of what he calls Pueblo Chili, a sweet pepper of a shiny coal black color. This will add to the trial plants in my collection. Then from Arizona comes a lot of seed of Frijole Colorado, a pinkish bean, which I shall also try in a small way. Several years ago I had from Mexico fruits of Physalis purpurea, a very large variety of the husk tomato, so-called; these I put in the hands of a Philadelphia seedsman, who now lists it. It is as large as a medium-sized tomato, and immensely larger than the old Physalis Alkekengi. Another friend sent me a few of the Tapary bean of New Mexico. Perhaps this may thrive in our sandy soil, as it is said to be very drought resistant.

Last Summer I planted some dasheens sent by the Department of Agriculture. The crop was not large owing to the very dry Summer, but I have quite a lot to plant this Spring, and will put them where the hose can reach them and hope for better success.

Last Summer, too, I had wonderful success with the Spotted-leaf calla as a bedding plant. A mass of these was very pretty and bloomed finely. This plant is perfectly hardy here, but I lifted the roots to divide and replant like potatoes. Massed where they can get plenty of water they make a very pretty bed, and increase wonderfully. The white-spathed flowers have a purple base, and are not as large as the calla grown in the greenhouses, but being Summer-bloomers are useful.

W. F. MASSEY.

"FARM products cost more than they used to." "Yes," replied Mr. Corntossel. "When a farmer is supposed to know the botanical name of what he's raisin' an' the soölogical name of the insect that eats it and the chemical name of what will kill it, somebody's got to pay."—Washington Star.

SHERWIN-WILLIAMS
PAINTS AND VARNISHES FOR FARM USE

It's cheaper to paint than to repair. You must do one or the other, because unprotected wood decays. There is economy in the preservation of your barns and out-buildings with

SHERWIN-WILLIAMS COMMONWEALTH BARN RED

It sinks into the wood that it covers and fights off the decay caused by weather in winter and summer. It spreads easily under the brush and a little of it goes a long way.

This is only one of our many preparations for the surfaces of your house and buildings. They are all described in our booklet, "Paints and Varnishes for the Farm," which tells how to use each one. We send it without charge. Ask for it today.

SAVE MONEY
Bigger Crops, Less Labor

with The Imperial Pulverizer because it does the work of a roller, pulverizer, clod crusher and leveler all in one trip over the plowed ground.

It is the ONLY machine that packs the subsoil and leaves ground loose on top. Makes best seed bed. Soil retains moisture and produces bigger crops.

Sweet Clover in Maryland.

Will you inform me about Sweet clover on the Eastern Shore, Caroline County, for cattle and hog pasture, also for hay and when to sow? J. W. S.
Goldsboro, Md.

Why anyone on the Eastern Shore of Maryland should want Sweet clover, where we can grow Soy beans, cow peas and Crimson clover in the greatest abundance, is hard to understand. Sweet clover smells sweet, but is really so bitter that no animal I ever tried would eat it unless starved into it. You can make better hog pasture with rape and Crimson clover and cow peas and Soy beans than you can with Sweet clover, and by sowing it here you will only add another weed that after a while you will be glad to get rid of. The plant will grow in Caroline County, but thrives best in a soil rich with lime. Better leave the Sweet clover to the cold Northwest, where they cannot do so well with better legumes as we can.

W. F. MASSEY.

Fruits for Michigan.

I have a small farm in Berrien County, Mich., and this Spring intend setting out some apples, sour cherries and also some quince trees. I already have an orchard of Northern Spy and Baldwin, but with to set other varieties. The soil is a clay loam. What varieties would you advise for commercial purposes in that section of the fruits mentioned below. Can the Wolf River, Wealthy and the Delicious be grown in this district with any degree of success? What sour cherry would you suggest, and what age of trees would be recommended? How many quince trees would be advised on a small farm and what variety would do best in this section? T. S.
South Bend, Ind.
